AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—**AMERICA**. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

LIBRARY OF UNIVERSAL KNOWLEDGE.

INFANT, in English law, means every male and female under the age of 21. As a general rule, an infant cannot enter into contracts; at all events, they are not binding except at his or her option. But a contract for necessaries is always binding, and an infant may be imprisoned for non-payment of these, like other persons. The father, or, after his death, the mother, of an infant can in general only be bound for an infant's debts where some express or implied contract to pay for these can be made out; and the mere fact of the infant living in the same house is not always sufficient to imply liability, though it is generally an element for the jury. If an infant enter into trade, he is nevertheless only bound by his contracts at his option. But in all cases, if the infant, on coming of age, ratify the contract, then it is binding on him.

An infant in England generally requires the consent of his parent or guardian to marry, though it is more correct to say that if he misrepresent in the preliminary formalities that he is of age, he may be indicted for perjury, but nevertheless the marriage will be good, and cannot be annulled. An infant cannot make a will either of his real or personal estate. He can only sue in a court of law by a near friend or *prochein ami*, who is his father if alive, or any other friend.

In Scotland the law differs in many respects from the law of England on this subject. The term infant is not used at all in a technical sense. All persons, if male, are in legal strictness called pupils till 14, and if female, till 12; and from 14 or 12 to 21, they are technically called *minors*. In general, the contracts of a pupil are absolutely void, and he is under the care of tutors, who are either his parents, or others appointed by the court. A minor, on the other hand, may enter into contracts, but if they are to his lesion or prejudice, he can reduce or set them aside any time within four years after majority. Moreover, if a minor go into trade his contracts bind him, as they do other persons. Further, a minor can make a will or testament, operating on his movable estate, though he cannot alienate his heritable estate in like manner. The four years which are allowed to him after majority to consider whether he will set aside contracts are called *quadriennium utile*; and if he can prove lesion, he is in that period entitled to restitution. In Scotland, also, a minor may marry as freely as if he were a major, and, indeed, he is in general his own master, or *sui juris*, at the age of 14 (as a female is at the age of 12); whereas in England he would be liable to have a guardian appointed to control his person till he attained 21.

INFANT (*ante*), in law, is a person held to be too young to assume the full responsibilities of a man or a woman. By some systems of law the age of maturity is fixed at 25 years, but by the English common law the limit is 21 years for both sexes. The marriage of a boy of 14 years to a girl of 12 is held to be legal, and wills of personal property may be made at the same age. A promise to marry is not binding upon the promiser unless he or she is of full age. It has long been a rule of law that a minor becomes of age on the day next preceding the 21st anniversary of his birth. In some American states women reach the period of legal maturity at 18 years of age. An infant's contract will not be enforced by law; he may fulfill it or not as he pleases; but if it is renewed after maturity it is binding. The renewal may even be inferred from his acts, where no specific promise is shown. At his majority he may repudiate it at will; but if he be in possession of the property of the other contractor, he will be compelled to give it up. He will not be allowed to plead "infancy" as an excuse for retaining property not his own. There is, however, one exception to the voidable nature of an infant's contracts; he may bind himself for "necessaries," such as food, clothing, shelter, medical attendance, and the means of education. The limit of his obligation in this respect will be a question for a court and jury to decide in view of his wealth, social position, or other circumstances. If he voluntarily do anything which the law could compel him to do, the act will be valid and sufficient. In some states of the union he can become an executor at 17 years of age, in others not until 21. He is responsible for wrongs of an actionable nature done to others; but the practical application of this principle involves some very nice discriminations for the court. It has been held, for example, in some cases, that an infant who fraudulently represents himself to be of full

age, and thereby obtains property, is estopped from pleading infancy as a bar to an action for its recovery; but the soundness of this position has been questioned. An infant, if sufficiently intelligent, is held responsible for any crime that he may commit. It is a rule of the criminal law that this responsibility can never arise before he is 7 years of age; after that period, until he is 14, the law presumes nothing for or against him; his capacity to understand the nature and consequences of his act is a matter for investigation. After he is 14 he is presumed to be capable, and the burden of proving his incapacity rests upon himself. Courts generally incline to sentence juvenile criminals to reformatory institutions, with a view to the correction or mitigation of their evil propensities. Courts of equity guard the rights of infants with a jealous care, sometimes, for adequate reasons, taking a child from the custody of the parent and placing it in the care of one better qualified to train and educate it. An infant who is a property-holder is amenable to the law of taxation, and his land is liable to be taken from him under the law of eminent domain as if he were of age.

INFANTE (from the Latin *infans*, an infant), the title given in Spain and Portugal to the princes of the royal family, the corresponding title of *Infanta* being given to the princesses. Since the 14th c., however, the heir-apparent to the throne in Spain has been styled the prince of Asturias, and the heir-apparent in Portugal, until the separation of Brazil from the mother-country, bore the title of prince of Brazil. The personal domain of an infante or infanta is called the *infantado*, and this has come to be the name of a district which was made a dukedom in 1475.

INFANTE, JOSÉ MIGUEL, 1778–1844; b. in Santiago de Chili; a leader of the revolution of 1810, resulting in the independence of Spanish America; was also a member of the “congress of plenipotentiaries” in 1831, and chief-justice in 1843. He took an active part in the establishment of the common-school system.

INFANTICIDE, the act or practice of murdering infants, which is abhorrent to modern civilization, was common in ancient times, and now prevails among many barbarous nations. It prevailed in Greece and Rome, and (such is the force of custom) found defenders in Plato and Aristotle! The latter, in his *Politics*, says the law should forbid the nurturing of the maimed, and where a check to population is required, abortion should be produced before the quickening of the infant. In Sparta, we are informed that the law directed, when a child was born, the father was to carry it to an appointed place, to be inspected by the elders of the community. If they perceived that its limbs were straight, and its look was wholesome, they returned it to its parents to be educated; otherwise, it was thrown into a deep cavern, at the foot of the mountain Taygetus; and it was said this law had a wholesome effect, for it made women with child very careful as to their eating, drinking, and exercise, and hence they proved excellent nurses. In the other Grecian republics, a similar disregard of the life of sickly infants was shown. With regard to the practice among the Romans, little definite information exists, though learned authors discuss it at great length. It seems certain that it lay with the Roman father to say whether his child should be permitted to live or not. The exposition of infants, indeed, was the rule, rather than the exception, in most countries in old times. Among the Norse, the child's life always hung in the balance till the father handed it to the nurse to be reared; if, on account of its being weak, or a daughter, he disapproved of its living, it was exposed to die by wild beasts or the weather. In modern times, the practice is cruelly common among certain peoples. Child-murder prevails to a great extent throughout the whole of the South Sea islands. Among the Fijians, it is or was a system. A recent authority says that in Vanua Levu, in some parts, “the extent of infanticide reaches nearer two-thirds than a half.” Among the Hindus, the practice of destroying children, especially females, prevailed frightfully till it was checked in the time of the marquis of Wellesley's rule. The Rajpûts, it is said, destroy all female children but the first-born—a peculiar custom, due to its being a point of honor with a Rajpût to nearly ruin himself in the marriage feast and portion of his daughter, so that he could not afford to have more than one. The Mohammedans were inclined to the same practice, but effected their object chiefly by means of abortion. In New Holland, the native women think nothing of destroying, by compression, the infant in the womb, to avoid the trouble of rearing it alive. In China, infanticide is supposed to be common, the chief cause being said to be the right of periodically repudiating their wives, which is possessed by Chinamen. Some statistics, published some time ago in a well-known French paper, indicate the fearful extent to which life is lost through this practice prevailing in so vast a population as that of China. In all the cases above cited, it may be assumed there was no feeling of infanticide being wrong or criminal. In some, it was owing to religious feeling of a perverted kind; in some, to the difficulty of living; but in many, as among the Fijians, it would appear that the mother killed her child often from whim, anger, or indolence.

Modern civilization deals very differently with the subject of infanticide, for one of its maxims is that human life, from its first to its last hour, is sacred, and whoever willfully puts an end to it is a murderer, or a criminal of the same category. Instead of encouraging the destruction of life, modern civilization abounds in every kind of machinery for preserving it, however unsuccessful the attempt. The chief cause which now leads to infanticide is that of shame, which, however, operates only in the case

of the child being illegitimate. The parents often incur the risk of committing the crime of murder, to avoid social disgrace. In order, therefore, to appreciate the force of the checks put by the law on the tendency to infanticide, the law of bastardy (q.v.), the practice of instituting foundling hospitals (q.v.), and the kind and degree of punishments attending any attempt, more or less direct, to destroy the child either before or after birth, require to be taken into account.

The criminal law deals with the cognate offenses which make up infanticide in the following manner, whether the child is legitimate or illegitimate: As regards the procuring of abortion, every woman who takes poison or other noxious thing or uses instruments or other means to procure her miscarriage, is guilty of felony, and liable to penal servitude for life, or not less than three years; and so is any person who administers poison or uses instruments upon the woman with such intent. Whoever supplies drugs, poison, or instruments for the same purpose is guilty of a misdemeanor, and liable to penal servitude for three years. The concealment of birth is also made a criminal offense. Whoever, after a child is born, by any secret disposition of the body, endeavors to conceal its birth, is guilty of a misdemeanor, and liable to imprisonment for two years. This is the offense which, perhaps, is most frequently committed, or at least made the subject of prosecution in such cases, as the attempt to establish the larger crime of murder to the satisfaction of a jury, is frequently foiled by the secret sympathy shown towards the mother, who is presumed to have been the victim of seduction, or otherwise wronged. The existence of this offense shows the necessity which every woman likely to become a mother labors under of making public her situation to some extent. As the destruction of children may be effected by the negative fact of not supplying food and clothing, as well as by the positive act of wounding or ill-treating, the refusal or neglect of a parent or other person who is bound by law to supply food and clothing to the child, and neglects to do so, thereby causing its death, amounts either to murder or manslaughter, according to the circumstances. Moreover, the unlawful abandoning or exposure of any child under the age of two years, whereby the life and health of the child are endangered, is a misdemeanor punishable with three years' penal servitude. Where a person is charged with the murder of a very young child, it is essential to prove that the child was in life. The test of this is not that it breathed, or had an independent circulation after it was separated from the mother, but it is enough that the child was fully born; hence, if a man strike a woman with child, so as to cause the death of the child, he is neither guilty of murder nor of manslaughter of the child. The judges of England, in 1848, had to deliberately consider whether though a child was still attached to the navel-string, the killing of it was murder, and they held that it was. In all cases of the murder of infants, the question whether the child was fully born, and so the subject of murder, is generally one of medical jurisprudence, upon which medical skill is needed to throw light, and medical men have certain well-known tests for ascertaining this important fact. The above offenses in reference to infanticide are punished in a similar manner in Scotland.

It has been stated that an inquest is held daily upon the bodies of children destroyed through the design, the neglect, the ignorance, or the mental infirmity of the mothers. Even when the act may fairly be regarded as a crime, its enormity is generally greatly lessened in the eye of the law by the consideration of the physical condition and moral disturbance of the parent.

A further protection was given to infant life by an act of 1872, which obliges those who undertake for hire to nurse infants under the age of one year, to have their house registered, and to keep records of the children they take charge of. They must also give notice to the coroner or procurator-fiscal of such infants' deaths.

INFANTRY, the foot-soldiers of an army. Among semi-barbarous nations, fighting on foot has always been considered less advantageous than fighting on horseback or in chariots; but as war has become a science, the principal strength of armies is found to lie in their infantry. See ARMIES, TACTICS, WAR, etc.

INFANTRY (ante). The term *infantry* was originally applied to a body of men collected by the *infante* of Spain, for the purpose of rescuing his father from the Moors. The attempt being successful, the term was afterwards applied to foot-soldiers in general, as opposed to cavalry. Among the ancient nations of Europe the foot-soldiers constituted the chief strength of the armies. In the best days of the Grecian and Roman states, battles were won mainly by the force and discipline of the phalanges and legions, and the number of the infantry in the field far exceeded that of the cavalry. The cavalry were then, as at present, employed chiefly in protecting the wings of the army and in completing a victory gained by the infantry. The ancient Franks, when they left the forests of Germany, were accustomed to march and fight on foot; and they persevered in this practice even after they had obtained possession of the country of the Gauls, which abounded with horses. But soon after the time of Charlemagne the institutions of chivalry began to be generally adopted in the kingdoms of Europe. These led to frequent exhibitions of martial exercises or horseback in presence of the sovereigns and assembled nobles; and the interest inspired by the achievements of the knights on those occasions was naturally followed by a high regard for that order of men. By degrees the cavalry, which was composed of persons possessing rank and property, and completely armed, acquired the reputation of being the principal arm in

war; and the foot-soldiers, badly armed and disciplined, were held in comparatively small estimation. This continued 400 years, and although war was the principal occupation of mankind, military science fell into neglect. But rulers were forced by the power of feudalism to make an alliance with the despised class of foot-soldiers, and in 1214 we find that some of the German infantry was recognized to be "very good, and trained to fight on the level even against cavalry." The chivalry of France was routed at Courtrai by the infantry during the next century, and the Austrians suffered defeat by the efficient work of the Swiss pike at Morgarten (1315), Sempach (1386), and Nafels (1388). At Cressy and Poictiers (1346-56) the knights of England dismounted to fight beside the successful infantry. The principal weapons of the infantry before the invention of gunpowder were long-bows, halberds, cross-bows, spiked clubs, axes, pikes, straight swords, shields, corselets, mail-jackets, helmets, and partisans. In the 16th c., however, these weapons were replaced by fire-arms, and in the 18th c. the musket was in general use. It became customary during the thirty years' war to form battalions of infantry composed of 500 men, which were massed into dense columns during battle, in spite of the deadly effect of the enemy's artillery and fire-arms. The absurdity of this formation was first exposed by Gustav Adolph, who, recognizing the destructiveness of fire-arms, arranged his battalions with a view to increasing the effectiveness of the fire of his own troops, while avoiding exposure to that from the enemy. His tactics were so successful at Breitenfeld and Lutzen (1631-32) that they were soon afterwards universally adopted. The bayonet came into use in 1670, and the socket-bayonet about 1699. Frederick the great made many improvements till then comparatively unknown. The rapidity with which his infantry troops performed their evolutions during battle contributed largely toward his famous victories in the seven years' war. In fact the Prussian infantry have ever since his time served as models for other European countries. The superiority of this arm consists in the troops being able to act on ground where cavalry cannot, and it is obvious that the latter must be nearly useless in the attack of fortified towns. During the war of the rebellion in this country skirmishing was in vogue in the northern and southern armies. It had been in use during the revolutionary war, and was well suited to the American character. Skirmishing has since been adopted in Prussia, and the skirmish line is recognized as the proper formation in battle to avoid the destructive effect of breech-loaders. The co-operation, however, of cavalry and infantry troops was neglected by American generals. Artillery fire usually opened the battle, and was followed by the advance of the whole line on the run in a final charge. The infantry tactics in general use were those of Casey, founded on those of Scott. Casey's tactics, however, were abandoned for those of Hardee, and in 1867 those of Upton were finally adopted.

Pursuant to the act of congress of Aug. 15, 1876, the army of the United States was reduced to a maximum of 25,000 men, and by general orders issued May 19, 1877, the maximum strength of the infantry was fixed at 9,875. This included 37 enlisted men per company for 250 companies of infantry, and 5 for non-commissioned staff at each of 25 regimental head-quarters of infantry.

The arm that has been adopted for the infantry is the Springfield breech-loading rifle, and the uniform for privates is a single-breasted dark blue basque coat, sky-blue trousers, blue cloth cap with a white pompon; for officers, a double-breasted frock-coat of dark blue cloth, and light blue trousers with black stripes. The overcoat is a dark blue double-breasted surtout. The equipments are a knapsack with great-coat straps, a haversack, a canteen, a cartridge box, and a bayonet scabbard. The pay of the United States infantry is as follows: Col., \$3,500 per annum; lieut.col., \$3,000; maj., \$2,500; capt., \$1,800; adj., \$1,800; regimental quartermaster, \$1,800; first lieut., \$1,500; second lieut., \$1,400; chaplain, \$1,500; first serg., \$22 per month; serg., \$17; corp., \$15; private, \$13. An increase of 10 per cent is allowed for every five years' service, provided the total amount of increase does not exceed 40 per cent of the whole pay.

INFANT SCHOOLS. Oberlin (q.v.), the pastor of Waldbach, in France, may be regarded as the founder of infant schools. He appointed females in his own parish to assemble the little children between the ages of two and six, his object being to interest them by conversation, pictures, and maps, and to teach them to read and to sew. The first infant school attempted in this country was in connection with Robert Owen's socialistic establishment in Scotland; it was taught by James Buchanan. In 1819, through the efforts of lord Brougham and lord Lansdowne, an infant school was set on foot in London. One of the first teachers was Wilderspin, whose labors in connection with the extension of infant schools are well known. His methods, based on the Pestalozzian system, were further matured by the home and colonial infant school society, founded in 1836. This society, by training teachers and instituting model infant and juvenile schools, has done more than any other to propagate the infant-school system.

Infant schools are not yet very numerous either n. or s. of the Tweed; but they have certainly been more extensively encouraged in the southern than in the northern half of the kingdom. Two causes have operated to prevent their more rapid increase—the want of means, it being necessary to devote to juvenile schools the money which can be collected for educational objects; and the defects which have hung about the system, and brought it into disrepute. Too much has frequently been attempted in the way of direct

instruction. In Germany, under the name of *Kleinkinderschulen* and *Kindergärten*, infant schools are numerous. In France, under the name of "Asylums," they are very widespread. See **KINDERGARTEN**.

Infant schools, like other seminaries which are not purely *professional* in their aims, ought to keep in view the threefold nature of the child's mind, and appeal to its different faculties in turn. But while the intellect, the moral nature, and the imagination ought to receive their proper food, it has to be borne in mind that we contradict the laws of nature when we omit an element more powerful and exacting than any of these; we mean the physical, and that love of play, fun, and nonsense which is connected with it, and which is peculiar to infancy, and not unbecoming even the gravity of manhood. By marching, exercises, toys, and, above all, by the judicious use of a large open playground, full provision should be made for the muscular restlessness of children, and for their love of play. The room in which they are collected should be little more than a well-ordered, covered playground. In the playground, whether open or covered, order, obedience, kindness, consideration, civility, cleanliness, good-temper, are to be taught, and the *moral* objects of the infant school attained. Play, and the moral training which may be connected with it, should be the leading ideas of the place, and to these everything else should be subordinated. Next to this, the intellectual nature of the infant has to be considered, its future anticipated, and the elements of reading taught, but with the help of such methods and books as call for the minimum of mental exertion. An infant school which has cultivated the moral nature of its children through games and exercises, and has taught them to read easy monosyllabic sentences by the time they reach the age of six, has accomplished its work well. At the same time, other means of awakening interest and intelligence may be resorted to with advantage, but under this restriction, that if they fail to call forth spontaneous and unconscious attention, either through the want of skill on the part of the mistress to present them in an attractive form, or through some defect in the apparatus at the command of the mistress, they should at once be given up. We refer to songs of a moral or narrative kind—rhymes and nursery jingles—descriptions of objects and pictures by the children under the teacher's guidance (object-lessons)—the concealed purpose being to cultivate the perceptive faculties of form, color, number, size, etc.—and lessons in arithmetic on a ball-frame. Then, again, the teacher may collect the children around her and read to them fairy tales and simple stories of incident and the affections. All this may be and actually is attained; but the qualifications in the teacher for the attainment of them are rarely to be met with. So far as these qualifications are of a moral or imaginative kind, they are natural endowments; but they may receive enlightenment and direction by a judicious system of training. In the first report of the home and colonial school society, it is truly said, "that few situations in life require so much discretion, so much energy, so much tenderness, so much self-control and love, as that of a teacher of babes." Without a consciousness that she possesses these qualifications, especially the last-named, no woman should for a moment contemplate the career of an infant-school mistress.

The question still remains to be considered—whether infant schools are desirable at all, and whether the family hearth, and the fields, or the streets, do not constitute the best, because nature's infant school. The answer given by many would be that, were society in a healthy and normal condition, infant schools are hurtful even at the best, and that, when we bear in mind the chances of their being badly conducted, they may be generally denounced as a public nuisance. But we are *not* in a normal state; and while infant schools proper are, perhaps, superfluous in rural parishes, they are in populous places a boon and a blessing, if not a necessity.

INFANZONA'DO, the name of a district in the Spanish province of Biscay, containing 72 villages. It is divided into the five *merindades* of Arratia, Bedia, Busturia, Marquina, and Uribe.

INFECTION is distinguished from contagion (q.v.) by some medical writers, who would restrict the latter word to the cases in which there must be *contact* of the healthy person with a patient, while they apply the term *infectious* to diseases which can be conveyed by the atmosphere.

INFECTIOUS DISORDERS in cattle have been made the subject of special enactment, in order to protect the public from the calamities arising from the spread of disease in so important an article of food. The contagious diseases (animals) act 32 and 33 Vict. c. 70, authorizes inspectors to be appointed, who have power to enter cow-sheds and stables, and report if disease exists. Sometimes sound cattle require to be slaughtered, in which case half or three-fourths of the value are allowed by the county or borough rate to the owner. Penalties are imposed for turning out diseased cattle on uninclosed lands or in markets, for not purifying sheds, for not disinfecting railway cattle-trucks and steamboats. The owner is bound to give notice to the inspector of any symptoms of disease appearing; and the hay, straw, litter, or dung of infected animals cannot be lawfully removed except for the purpose of being destroyed, and with an inspector's license. The inspectors are appointed by the local authorities, and are removable by the privy council.

INFECTMENT, or **SASINE**, a Scotch law-term, used to denote the symbolical giving possession of land, which was the completion of the title, the mere conveyance not

being enough. The instrument of sasine was the notarial instrument embodying the fact of infestment. But now the necessity of a separate formality is unnecessary, it being sufficient to register a conveyance in the register of sasines in Scotland. In England there is no similar register for deeds, and the title is complete when the conveyance is executed and delivered to the purchaser. In Scotland an *infestment in security* is a temporary infestment to secure payment of some debt; and an *infestment of relief* is a similar security to relieve a cautioner.

INFIDEL. a name generally applied to one who disbelieves the Bible as a divine revelation, but sometimes used also for a skeptic or doubter, and for him who calls himself a freethinker.

INFINITE. This word is the source of much controversy and difference of opinion. Some hold that there corresponds to infinity a distinct notion, which we are entitled to entertain and reason about, with the same confidence that we discuss measured intervals, as a yard or mile; while others maintain that the word is a name for a mere negative. Sir W. Hamilton goes so far as to say that "the infinite and the absolute are only the names for two counter-imbecilities of the human mind, transmitted into properties of the nature of things—of two subjective negatives converted into objective affirmatives" (*Discussions*, p. 21). And Mr. J. S. Mill holds a similar view. It had also been maintained by Locke that we have no positive idea of the infinite, that it was only the negative of an end or termination (*Essay on the Understanding*, book ii. chap. 17).

The notion of the infinite has, indeed, been admitted into mathematical reasoning, a circumstance that would seem to imply that we could use it with exactness, and, consequently, it could not be altogether an incompetence or imbecility of the understanding. It appears, however, that mathematicians use the word under peculiar restrictions. They employ it in the two extremes of the infinitely great and the infinitely little. "If we see a conclusion, which we can nearly attain by the use of a large magnitude, more nearly by the use of a larger, and so on without limit, that is to say, as nearly as we please, if we may use a magnitude as large as we please, but which is never absolutely attained by any magnitude however great, then such conclusion may be said, for abbreviation, to be absolutely true when the magnitude is infinite" (*Penny Cyc.*, art. "Infinite"). The very same statement might be made regarding the infinitely small, which is represented in mathematics by the symbol for nothing, although it is not the same as nothing in the strictest sense, namely, the nothing caused by subtracting a quantity from itself, as two from two. It is nothing in this sense, that if added to a finite quantity, as 10, it produces no augmentation that can be made use of: the quantity for all purposes remains the same. The machinery of infinite quantities plays a large part in the operations of the higher mathematics, and is introduced in order to compare two things naturally incommensurate. Thus, in estimating the area of a curved surface, such as a circle, in straight-lined spaces, such as square inches, the difficulty was got over by a sort of fiction, namely, by supposing the circle to be inscribed by a right-lined figure or polygon, of such a very great number of sides that they coincide to all intents and purposes with the curved circumference. The coincidence can never be perfect; but by imagining the sides to be smaller and smaller, and, consequently, more and more numerous, the difference between the polygon and the circle may become less than any assignable quantity, or, as it may be said, infinitely little, in fact, as good as nothing, so that the estimate of the area of the one will stand for the estimate of the area of the other. This device for overcoming the natural incommensurability of straight and curved, and of number and motion, is the real occasion of the mathematical use of the term in question. Nor does it give any foundation for the view that would regard the infinite as a positive conception of the mind which we may apply to objects with a conscious meaning.

This will be more apparent when we attend to the difference between two classes of negative notions. The first class includes those whose negative brings something positive; thus, not hot, brings before us a positive experience, namely, cold; not white, according to what is intended, turns up either black or all other colors, which are to us as much a positive, or real, conception as white. Unjust, or not just, is the name for a distinct class of really existing actions, in contrast to the class named just actions. All notions, such as these, which have for opposites really existing things, are real and genuine notions of the mind; they are conceivable by us to the full extent that we are capable of conceiving anything whatsoever. In fact, the highest test of genuineness, reality, and conceivability, is the existence of a negative, which is also real and positive. Body or matter is a real conception by being opposed to space; the one resists our movements, and the other permits them. Body and space together make the extended universe, the world of externality, or objective existence: which has a distinct meaning by contrast to the inextended mind, or the subject universe. But *existence*, as a whole, is not a real conception, because we have nothing to oppose it to; non-existence is not a real opposite, like space to body, or mind to extension; it is only a formal or verbal opposite, made up by using the word for negation to a case that does not admit of the operation. Non-existence is total annihilation, which, of course, we cannot conceive, as we do cold or black, in their opposition to hot and

white. This being so, we have nothing to affirm respecting existence as expressing the absolute totality of things. See EXTENSION.

Now, to which class of notions does infinite belong? Is it a real opposite to the finite, like cold to heat, or a verbal and formal opposite, like non-existence? Finite means what has a boundary or termination, and applies strictly to body, which is always conceived by us as bounded and terminating in space. The bounded is, in fact, body (or some analogy of body, as when we fancy an inclosure which we do not actually construct); the absence of bounds is free space, which is a real conception. It means scope for movement, freedom from obstruction, and its opposite is some inert matter, standing in our way, to prevent further movement. The unbounded is thus another name for *space*; and when we arrive at a space with no further prospect of obstruction, we may call that a boundless space, but the only meaning we have thereby is a space which no longer contains material obstruction. And we can conceive of no other end of space. Our whole experience furnishes no other contrast except these two, space and body, and where the one ends, the mind must conceive the other. We may conceive the not-extended, it is true, by passing to the subject mind, with its feelings and volitions; but within the sphere of the extended we have no choice but between space and body. We cannot conceive the end of space otherwise than by the beginning of resistance; anything else (not being the subject mind) would be non-existence, or annihilation.

The infinite may thus be the name for an abbreviation in mathematics, but as a real notion of the mind, it merely expresses our inability to pass beyond the region of our experience of matter and space.

INFINITESIMAL CALCULUS. See CALCULUS.

INFINITIVE. See VERB.

INFLAMMATION is the most important of all the morbid processes that fall under the notice of the physician or surgeon. The most obvious symptoms or phenomena of inflammation, when it attacks an external or visible part, are pain, redness, heat, and swelling, or, in the words of Celsus, "*rubor et tumor cum calore et dolore.*" The general characters of the process will be best understood by an assumed case. If a healthy man gets a splinter of wood or any other foreign body imbedded in any fleshy part, he begins to experience pain at the part, and this is soon succeeded by redness of the skin, a firm and extremely tender swelling at and around the spot, and a sense of abnormal heat. These purely local symptoms are succeeded, if the inflammation reach a certain degree of intensity, by a general derangement of the vascular and nervous systems, to which various names, such as constitutional disturbance, symptomatic or inflammatory fever, pyrexia, etc., have been applied. If the foreign body is extracted, the probability is that all these symptoms will gradually abate until the part at length regains its natural appearance and sensations. In this case the inflammation is said to terminate by *resolution*, and this is the most favorable mode of termination. If, however, the cause of irritation is not removed, or if the intensity of the morbid process exceed a certain point, the following phenomena occur: the swelling assumes a more projecting or pointed form, the part becomes softer, and the skin at its center, which is usually the most projecting part, becomes whiter. There is a sensation of throbbing pain, and if the skin be not divided by the knife, it finally breaks, and a yellow, creamy-like fluid, known as *pus* (q.v.), escapes, after which the symptoms readily abate. This termination is known as *suppuration*.

If the original injury was very severe, and the inflammation intense, there may be actual death of the part affected. In that case, the red color of the skin becomes purple or greenish black, the pain ceases, and the part becomes dead and putrid. This is *mortification*. Under favorable circumstances, this dead part, which is called a *slough*, spontaneously separates from the adjacent living parts by a vital process known as *ulceration* (q.v.), and the cavity which is thus formed gradually fills up and heals.

The *pain* may vary from mere discomfort to intense agony. There is usually most pain in those parts in which the tension produced by the swelling is the greatest, as in bone, serous and fibrous membranes, etc. The pain occurring in inflammation is always aggravated by pressure, and by this means the physician can often distinguish between inflammatory and non-inflammatory disorders. The *heat* is seldom so much increased as the sensations of the patient would lead him to believe; it does not rise above the maximum heat of the blood in the interior of the body. This increase of heat depends upon the increased flow of arterial (or highly oxidized) blood to the part. The *redness* depends upon there being more blood than usual in those vessels in the affected part which usually carry red blood; upon the blood containing an increased number of red corpuscles; and upon red blood entering into vessels which, in the normal state, convey colorless fluids only, or which naturally admit so few red corpuscles that they cannot usually be observed. The *swelling* depends in part upon the distension of the blood-vessels, but mainly upon the effusion of various fluids, such as blood, serum, coagulable lymph (or fibrine), and pus into the tissue of the affected part. These fluids are termed the *products* of inflammation. This coagulable lymph frequently becomes organized, and many changes, some of a reparative nature (to which a reference will be presently made), and others of a morbid nature, depend upon its effusion.

Numerous observers have attempted to trace the exact phenomena of inflammation, by microscopic examination of the transparent parts of animals in which the process has been artificially excited. From observation made on the web of the frog's foot and other transparent parts of animals by Wharton Jones, Paget, and others, the following general conclusions may be drawn.

1. The primary effect of a slight stimulus applied to the blood-vessels is a slight and gradual contraction, with a retardation of the current through them.

2. During this contraction, the blood is impeded, or altogether stops. But the vessels soon dilate to a size larger than they originally possessed, and the blood now moves through them more rapidly than in the normal state. The slight stimulus that previously caused the vessels to contract, has now, if re-applied, little or no effect; but on applying a more powerful irritant, such as a minute drop of tincture of capsicum, the phenomena of active congestion or determination of blood become almost instantaneously developed. The vessels become lengthened, dilated, and tortuous, and are distended with blood which contains a great excess of red corpuscles, and is circulated with far more than the normal velocity.

3. But if the injury be still more severe—if, for example, a red-hot needle be inserted—then, in addition to the active congestion described in the preceding paragraph, there is a retardation, and finally a complete stagnation of the blood in the capillaries of the injured spot, while around it the blood moves rapidly through turgid but less full vessels.

The blood obtained by bleeding a patient suffering from inflammation of any important organ, usually presents a peculiar appearance after coagulation. In healthy blood, the clot consists of a uniform admixture of blood corpuscles and coagulated fibrine, and is of a deep red color; but in inflammation, the upper part of the clot consists of a layer of a yellowish or whitish color, to which the term *buffy coat* is applied. This buffy coat is often concave, or hollowed out into a cup-like form, in which case the blood is said to be both buffed and cupped. The cause of this buffy coat is still to some extent an open question; but the phenomenon is clearly due to a subsidence of the blood corpuscles, by which a layer of fibrine, forming the buffy coat, is left at the surface. Another and a more important change in the blood in inflammation is the augmentation of the fibrine, which often rises to two, three, or more times its normal quantity.

Reference has already been made to coagulable lymph or fibrine as one of the products of inflammation. This effusion of coagulable lymph is so important a process both for good and for evil, that a few lines must be devoted to its special consideration.

When coagulable lymph is effused between membranes that are normally in contact (or nearly so) with one another, it often causes them to cohere. In this way we often have adhesions of the adjacent surfaces of serous membranes, such as the pleuræ, the pericardium, and the peritoneum, which materially interfere with the natural free motion of the parts, and occasion various persistent morbid symptoms. In inflammation of the iris, the pupil may be rendered irregular or immovable, or may even be closed up by the effusion of coagulable lymph. In endocarditis, or inflammation of the lining membrane of the heart, coagulable lymph may be deposited in wart-like masses on the valves, and may thus occasion some of the worst forms of cardiac disease. On the other hand, in many cases, the effusion of coagulable lymph has a reparative and conservative influence. It is by the organization of this fluid that the lips of recent wounds are glued together, and that parts recently severed from the body may be sometimes replaced and still live. The success of the Talicotian operation, by which a new nose is engrafted in the position of that which had been lost—of the operation of injecting a stimulating fluid into cystic tumors, etc., with the view of setting up adhesive inflammation—and of various other surgical operations, essentially depends upon the property of organization possessed by this fluid. It is thus, too, that ulcers are gradually filled up till the breach of texture is repaired.

The inflammatory diseases of the most important organs are described under their specific names, and, as a general rule, the termination *itis* is employed to indicate an inflammation. Thus, pleuritis signifies inflammation of the pleura; peritonitis, inflammation of the peritoneum; iritis, inflammation of the iris; etc. Inflammation of the lungs, however, is usually known as pneumonia instead of pneumonitis.

It is unnecessary to enter into the consideration of the treatment of inflammation further than to remark (1) that if possible we must remove its exciting cause, which can seldom be done except when the inflammation is external; and (2) that the patient should be placed on a strictly antiphlogistic regimen (which implies a total abstinence from solid animal food and stimulating drinks, due attention to ventilation, temperature, etc.). Of the direct remedies, the most important (except in persons of weak or broken-down constitutions) is blood-letting, although at present it is somewhat out of fashion. The medicines chiefly employed are purgatives, preparations of mercury, tartar emetic, and opium; while, as external applications, hot fomentations (occasionally cold lotions), and counter-irritation by means of blisters, sinapisms, setons, etc., are often of service.

INFLAMMATION (*ante*). It is held by some authorities that during the first stage, when the capillaries are contracted, the circulation is increased in rapidity, and diminished during dilatation; while others hold that it is slower in the first stage and more

rapid in the second. This difference of opinion arises in consequence of making the observations under different circumstances. If a capillary be enlarged through its whole length the blood will pass through it, for a short time, more rapidly than is natural, and when constricted it will be slower; but if contracted in some places and dilated in others, the blood will necessarily move more slowly in the dilated places and more rapidly in the contracted places, according to physical laws. But after a while an oscillation will take place, and at last there will be stagnation, and distension with colored corpuscles. Liquor sanguinis then exudes through the walls of the vessels, which are sometimes ruptured, allowing the blood corpuscles to escape. The contraction of the capillaries in the first stage and their dilatation in the second is in consequence of the action of involuntary muscular fibers which are placed around the vessels in a transverse direction, like the involuntary muscular fibers of the intestinal canal. This fact explains the power of the emotions over the capillary system in producing pallor and blushing. Sometimes all the symptoms of inflammation are not present, and sometimes they may all be absent, as in the latent pneumonia of the aged. It is necessary, therefore, for the physician to be very guarded in his diagnosis, particularly if the patient be feeble or old. As to the result of an inflammation, it will depend upon whether the exudation live or die. If it live, it undergoes transformations which depend upon the condition of the system. If the system be healthy, the exudation, if it take place upon a serous membrane, will have a tendency to form fibrous tissue, but on mucous membranes or in areolar tissue the tendency is to the formation of pus corpuscles. When the exudation accompanies inflammation produced by wounds the superficial portion is transformed into pus, while the deeper portion is converted into nucleated fibers, which eventually form a cicatrix or scar. Severe inflammation, such as that which takes place after a compound fracture, is attended by several very decided symptoms, such as marked alternation of heat and chilliness; the pulse is very rapid, the skin and mouth are dry, the urine scanty and high-colored. There is great thirst, and unless relief be procured delirium will soon supervene. Constipation is the rule, but, when the bowels are moved, the discharges are very offensive.

According to the manner of its action inflammation is called healthy or unhealthy; and that which is called healthy is really a natural and not a morbid process, the only pathological product being pus, and that of a character called healthy. The color which inflammation produces in a part depends upon the kind of tissue invaded, and upon the intensity of the action. Ligaments and tendons rarely become red. Fibrous membranes, like the sclerotic coat of the eye, assume a lilac color; the mucous membranes at first become scarlet, then darker, and, if the tissue die, black. Inflammation of serous membranes passes from lilac to scarlet, to brown. The kidneys become violet. Inflammation arrests nutrition and consequently diminishes the amount of tissue in a part, which becomes manifest when the swelling subsides.

The treatment of inflammation has been greatly simplified and improved by the discoveries of modern histology and therapeutics. It is local and general, the former consisting in various applications depending on circumstances. Sometimes warm fomentations are desirable, as affording relief to the nerves of the part, and promoting an interchange of material in the stagnated parts. Sometimes the continued application of cold is the best remedy to prevent destructive action. Inflammation is sometimes prevented by bandaging or by the application of adhesive straps, but such an operation requires great caution. The study of pathology and experience in practice has shown the impropriety of employing depleting measures in most of the inflammatory conditions, which usually require measures calculated to increase nutrition. Indeed, it is to be borne in mind constantly that recovery from inflammation consists mainly in regeneration or reproduction of tissue. The old tissue must mainly pass away, and the newly formed can be healthy only when developed under the influence of healthy nervous action. Therefore recovery is gradual and requires the repeated renewal of considerable of the tissue of diseased parts. Tonics are often of more service than depletants, and anodynes are of frequent advantage in allaying irritation. Great attention must be paid to the condition of the blood. This vital fluid is naturally alkaline, but often diminishes in this property during inflammation. The alkalinity should be increased by the administration of alkaline medicines, such as the bicarbonates of soda or potash, or both. Wine is often of advantage; also, a nutritious but bland diet. There are conditions of inflammation, however, when decided antiphlogistic measures are indicated, as in violent attacks of pleurisy in robust persons. In such, sometimes the only means of saving the life of the patient is prompt bleeding, together with the administration of opiates, and sometimes mercurials, in no hesitating and doubting manner. Great attention should be paid to ventilation. The purer the air the more rapid will be the recovery. Frequent bathing, generally with tepid water, and all the well-established hygienic measures suitable to the occasion, should not be neglected.

INFLECTION is a general name used by grammarians for all those changes that words undergo when placed in relation to one another in a sentence. See **DECLINATION**, **CONJUGATION**, **GENITIVE**. Most of these changes occur in the end syllable or syllables of the word; and with regard to these at least, there is every reason to believe that they were originally separate words joined on to the root words (see **LANGUAGE**), and that

through the natural processes of phonetic change and decay, the compounds thus formed gradually assumed the forms now known in grammar as cases, numbers, persons, tenses, etc. In some instances the original suffix can be readily recognized, and, by the help of comparative grammar, much has been done in recent times in tracing the more disguised inflections to their source; so that the greater part may be considered as satisfactorily established. Confining our remarks to the Indo-European languages, we may safely assert that the syllables used in forming the cases of nouns and the terminations of verbs are of pronominal origin. Thus, *mi*, *si*, *ti*, as the endings of the three persons of the present singular of the verb, are evidently connected with the personal pronouns *ma*, *ta* (*sva*), *ta*; and the plurals *mas*, *tas*, *nti*, contain the same with an indication of the plural number. The nominative singular of masculines and feminines, ending in *s* (*equu-s*, *ἵππος*, *fini-s*, *πίστις*), contains the personal pronoun of the third person, *ta* (*τό*, nom. *sa*, *δό*); the plural, *piscēs*, *χόρακες*, is probably only a corruption of the same pronoun put twice (*pisci-sa-sa*—i.e., fish that and that), the doubling of the pronominal element expressing symbolically a plurality of the same thing. In the oblique cases we meet with other pronominal elements, which indicate that a certain thing is placed with regard to the predicate in the three fundamental directions of motion—those of *whither*, *where*, and *whence*. The accusative is the exponent of the direction of an action *towards* some object, and its termination *m*, in the plural *ns* (i.e., *m* with the plural termination *s*), is connected with the pronomens *ama*, *yon*. *I* (comp. Lat. *i-s*, *i-d*, *i-bi*) is the pronominal syllable employed for signifying that an action has arrived at a certain goal, and is continuing there, giving the dative and locative cases; while the starting from a certain point is indicated by the pronoun of the third person *ta*, and its equivalent *sa* (that), corrupted to *t* and *s*, the termination of the ablative and genitive cases. The dative and genitive of the plural express the same relations as the singular, though they are less clear as to their origin. If, notwithstanding the identity of terminations, the aggregate of nouns must, by a manifest analogy, be classified into several distinct declensions, this, in most cases, is to be accounted for by the difference of the formation of stems or bases previous to their coming in contact with the affixes. It is natural that the so-called crude forms should undergo a different process of contraction according to the nature of their final vowel. The dative *lupo*, from the crude form *lupō*, is as much a contraction of *lupo-i*, as is the dative *fini* from *fini-i*. Consonantic bases, or of the vocalic, those which end in *u* (*v*), a vowel of a decided consonantic quality, are most apt to preserve the inflections in their unaltered form, being less liable to change on the conflict of congruous or incompatible elements. Accordingly, we find that the third Greek and the third and fourth Latin declensions present a much more normal aspect of the original inflections than the others. This does not preclude the possibility of a peculiar inflection being preserved in one or other declension; for nothing is more certain than that language, at a certain stage of its development, created and applied a great variety of means to the same purpose, and that these became limited only when the rising intellect of the human tribes, and their distribution into larger or smaller political bodies, taught and compelled them to economize their ways of expression.

In the formation of certain tenses of the verb we find a process different from the combination of a nominal or verbal base with a pronominal syllable. The Latin subjunctive of the first conjugation, the future in *bo*, the Greek optative and future, the Latin imperfect, and the perfect ending in *avi*, *ui*, *ivi*, consist of the verbal root with an already inflected form of the verbs *i*, to go, *as* and *fu*, to be. However strange this may appear at first sight, it is nevertheless a fact that, e.g., *εἰην*, I would be (for *ἐσ-ην*, Ser. *s-yām*, Lat. *s-iem*), originally meant I go (if I mistake not) in being, I am in doubt of the fact of being; that *ποιη-σεις*, thou wilt do, is literally translated, “thou mayst be doing.” The Latin *i-bat* for *i-fuat*, or *i-vit* for *i-fuit*, is still more clearly, “he was in the act of going.” That auxiliary verbs sometimes assume the function of inflections is proved by the French future, whose forms like *trouverai*, *finirai*, are easily recognized as compositions of the infinitive with the verb *avoir* (*finir-ai*, I have to finish).

The inflections hitherto described affect the end of words, and possess the character of a composition of a significative word or root with a syllable of local import, or an inflected form of a verb. But language also employs other means of a symbolical nature, either in the middle or the beginning of verbs, with the object of representing the various aspects in which an action can appear. We find that the present tenses generally have longer forms than those of the past. The additions commonly used are long vowels or diphthongs, inserted nasals and semi-vowels, or, lastly, reduplication. It seems that the weight given to the verbal root by these appliances is intended to exhibit the continuance of an action in the present tenses, in contrast with the fleeting or momentary operation of the past. In a similar manner the long vowels peculiar to the subjunctive in Greek (*τύπτετον*—*τύπτητον*, *τύπτομεν*—*τυπτωμεν*) convey the idea of doubt or uncertainty, by means of the longer interval required for the pronunciation of the intermediate long vowel, thus expressing the hesitation of the speaker with regard to the reality of his judgment. The reduplication in the perfect, being originally a repetition of the root (*tu-tudi*), is not so much the sign of a past time as the symbol for an action having passed from the stage of incipience into that of completion.

The wear and tear of time exercises its influence as well on the radical part of words as on their inflections. Grammatical terminations of a totally different formation by

corruption become obscured, and identical in shape with others of heterogeneous purport. The Latin *Romae* takes on itself the functions of *Romá-i-s* (gen.), of *Romá-i* (dat.), *Romá-i* (locat.), and *Romá-i-es* (nom. pl.); or *populo* those of *populó-i* (dat.), *populó-d* (abl.), and at a very early age that of *populó-m*. The absence of written standard works of such a national importance as to penetrate into the masses of a people, and to check their inclination towards misapplying or neglecting inflections which in progress of time have lost their inherent meaning, and therefore appear cumbersome, accelerate the change of the inflective system into the analytical. The demand for a precise and, so to speak, material expression of those manifold relations appropriated to inflections in ancient languages, is felt more keenly with the waning distinctness of the latter; and sudden political revolutions, such as the invasion of Italy by Teutonic tribes, or the conquest of England by the Normans, interrupting the influence of the privileged classes of a nation, bring the struggle to an issue, and give the ascendancy to the popular movement. Articles, prepositions, pronouns, auxiliary verbs, take in modern languages the place of inflections; and notwithstanding that these are not entirely destroyed, they have a precarious existence, and are in danger of being finally supplanted by the tendency to represent every distinct relation of words to each other by a distinct expression. The application of the *s* as a mark of the possessive case becomes more and more limited in modern English, and the mistaken effort to supersede this relic of Saxon inflection by the substitution of the pronoun *his*, has only been defeated because it proceeded from learned pedants, and not from the people. The termination *nt* as a sign of the plural in French verbs (*aiment, aimaien*t), may be called almost a dead letter, only traditionally preserved in spelling. The loss of inflections has deprived modern languages of the wonderful simplicity and power of the ancient tongues, and the periphrastic mode of expression they have adopted prevents them from arranging all the parts of a sentence with the same degree of liberty. On the other hand, they have gained in perspicuity. After all they have only reversed the process of the combination of pronominal and auxiliary words with others; but by placing them in front, the attention of the hearer or reader is called at once to the particular modification of every possible shade of a given thought.

INFLECTION, in optics. See DIFFRACTION.

INFLORESCENCE (Lat. *in*, and *floresco*, to begin to flower), in botany, a term employed to designate the flowers of a plant considered collectively and with reference to the manner in which they are arranged and the succession in which they are developed. The flower-bud being a modified leaf-bud, and the parts of the flower modified leaves, it might be expected that the inflorescence should exhibit a close correspondence with the ramification of the plant, but the modification in the parts immediately concerned in the production of flowers is so great, that this is far from being the case. A most important classification of kinds of inflorescence is into centrifugal and centripetal (q.v.). When the flowering axis produces only a single terminal flower, the inflorescence must be regarded as of the centrifugal kind. The terms used to designate more specifically the different kinds of inflorescence are numerous. The principal of them are explained under separate heads, as CATKIN, CONE, CORYMB, CYME, PANICLE, RACEME, SPIKE, UMBEL, etc. But it is to be regretted that such terms are still used somewhat vaguely or carelessly, even by very eminent botanists, or in such various senses, that the inflorescence of the same plant is often described by one term in one botanical work, and by another term in another. And hence arise confusion and difficulty, not entirely to be ascribed to the endless variety which is exhibited in nature.

INFLUENZA, one of the class of diseases to which the term *zymotic* (q.v.) is now applied, has been long recognized by medical writers, although its name, borrowed from the Italian, is comparatively modern in this country. Cullen called it *catarrhus e contagio*, but although, in most cases, it closely resembles ordinary catarrh, it presents certain points of difference from that disease. In addition to the ordinary symptoms of catarrh, there is a sudden, early, and very striking debility and depression of spirits. This early debility is one of the most marked and characteristic signs of influenza. The mucous membranes (especially the pulmonary membrane) are much affected. The tongue is white and creamy, the sense of taste is lost, there is no appetite, the pulse is soft and weak, the skin, although at first hot and dry, soon becomes moist, and the patient complains of pains and soreness in various parts of the body.

In simple, uncomplicated cases, convalescence supervenes in the course of a week or sooner, but influenza is very frequently conjoined with bronchitis or pneumonia, in which case it is much more persistent and dangerous.

Influenza affords an excellent example of an epidemic disease, a whole community being often attacked in the course of a few hours. From this it may be inferred that the occurrence of this disease is connected with some particular condition of the atmosphere, but what that condition is, is not known. Not unfrequently, influenza follows close upon a sudden thaw; sometimes it is preceded by thick, ill-smelling fogs. One hypothesis refers the complaint to some change in the electrical state of the air; and one of the latest and most probable conjectures regarding its exciting cause is that of Schönbein, who refers it to the presence of an excess of ozone (q.v.) in the atmosphere. Like cholera, influenza generally follows a westerly direction, or one from the s.e. towards

the n.w., and its course seems to be altogether independent of currents of air, as it frequently travels against the prevailing wind.

The most important point in the treatment of influenza is *not* to bleed the patient, or in any way to depress his vital powers. He should be kept in bed; his bowels should be gently opened; his skin slightly acted upon, if dry; and, if the cough be troublesome, a mustard-poultice should be applied to the chest, and an expectorant mixture prescribed. In persons of weak or broken-down constitutions, ammonia, beef-tea, and wine and water must be given from the outset. The debility that often remains for a considerable period after the establishment of convalescence, is best met by the preparations of iron and quinine.

Few diseases increase the death-rate to such an extent as influenza, more, however, in consequence of the great number of persons who are attacked in a severe epidemic, than in consequence of its danger in individual cases.

INFORMA PAUPERIS, a term used when a person is allowed to sue as a pauper—i.e., by getting leave to dispense with paying the fees of court and other costs.

INFORMATION, in English law, is used in several senses. In criminal law, an information filed by the attorney-general or master of the crown office is a substitute for an ordinary indictment, and is resorted to only in cases of such misdemeanors as tend to disturb the peace or the government—for example, as libels on judges, magistrates, or public officers, bribery at elections, etc. This information is usually called a criminal or an *ex officio* information, and the defendant is put on his trial in the same way as under an indictment. There are other informations, such as those called *quo warranto*, to test the validity of an election or appointment to a public office, etc. An information by the attorney-general in chancery is a suit on behalf of the crown or government as to any misapplication of a public charity, or on behalf of an idiot's or lunatic's property. The term is also commonly used to denote the written statement often but not invariably made on oath before a justice of the peace, previous to the issuing of a summons or complaint against a person charged either with a crime or an offense punishable summarily. There are also informations in the court of exchequer to recover penalties for breach of the revenue laws. The term is not now used technically in Scotland, except in cases of difficulty, when the court of justiciary orders informations—i.e., written arguments—on both sides.

INFORMATION (*ante*), in law. In the U. S. courts actions for minor offenses, such as attempts to evade the revenue laws, etc., sometimes proceed upon information; but no capital or infamous offense can be prosecuted otherwise than by indictment. In several of the states all offenses which are misdemeanors may be prosecuted upon information, but in the case of felonies indictment is necessary. In Pennsylvania and some other states it is optional to proceed by either method. Information is often the form of proceeding in civil cases. By this process a person filling a civil office may be brought into court to show by what authority he assumes to exercise the functions thereof, with a view to his displacement in case it can be shown that his authority is insufficient, and that the office belongs to another. If an unincorporated association assumes corporate powers, it may be ousted by this process, while a legal corporation may be thus arraigned for a violation of its charter or any infraction of law.

INFORM'ER, in English law, the person who sues for a penalty under some statute. In many statutes which define offenses—not criminal but savoring of criminality—encouragement is often given to strangers to come forward and prosecute the offense, by giving them power to sue for the penalty for their own benefit in whole or in part. This practice has been much resorted to in modern statutes on most subjects. In England, when the informer sues in such an action, it is called a penal or *qui tam* action; but, in general, the penalty is now recoverable before justices of the peace in a summary way. In suits in chancery, which require to proceed in the name of the attorney-general, the informer is called a relator. In Scotland, an informer is the party who sets the lord-advocate in motion in criminal prosecutions; and the lord-advocate is bound to give up the name of the informer, who is liable in case of malicious prosecutions. See **QUEEN'S EVIDENCE**.

INFUSIONS, or INFUSA. These terms are applied in pharmacy to aqueous solutions of vegetable substances obtained without the aid of boiling. They are usually prepared by digesting in soft water (which may be either hot or cold, according to circumstances) the sliced or powdered substance in an earthenware vessel fitted with a cover. Cold water is preferable when the active principle is very volatile, or when it is expedient to avoid the solution of some ingredient in the vegetable which is soluble in hot, but not in cold water. For example, in preparing the infusion of calumba, cold water is preferable, because it takes up the bitter principle (which is the essential ingredient), and leaves the starch matter undissolved. In most cases, however, boiling water is employed. Infusions are preferred to decoctions when the active principle volatilizes at a boiling heat, as in the case of essential oils; or when ebullition readily induces some chemical change, as in the case of senna (q.v.).

Infusions may also be prepared by percolation (q.v.), a process which is extensively employed in the preparation of tinctures. When thus prepared, they are less liable to decay than when prepared on the old system.

INFRALAPSARIANS, or **SUBLAPSARIANS**, in ecclesiastical history are those who hold that God, for his own glory, permitted the fall of man without positively fore-ordinating it. According to this view God determined to create the world, to permit the fall of man, and from the mass of fallen men elect some to eternal life and leave the residue to suffer the just punishment of their sins. Opposed to these are the Supralapsarians who hold that the fall of Adam, with all its evil consequences, was predetermined from eternity, that election and reprobation precede the purpose to create and permit the fall. According to this view, God, to manifest his grace and justice, creates some to be saved and others to be lost. The majority of the members of the synod of Dort, composed of delegates from all the reformed churches on the continent and in Great Britain, and of the Westminster assembly, were Infralapsarians. Such was Augustine, and such have been those who adopt his system of doctrine.

INFUSORIA, a class of the sub-kingdom of animals called protozoa (q.v.). The term, originally almost synonymous with animalcules (q.v.), is now very much restricted in its signification. It was first used by Otto Friederich Müller, and was adopted by Cuvier, who made the infusoria the last class of *radiata* (q.v.). But their radiated structure is by no means established. No distinct trace of nervous matter has been found.—After Müller (1773-86), the next to devote himself to the special study of the infusoria was Ehrenberg, the publication of whose work on them (1837) was the commencement of a new era in the history of this branch of zoology, which has since been prosecuted with great industry by Dujardin, Stein, Lachmann and Claparède, Cohn, Lieberkühn, Rymer Jones, and others. Many of the organisms included by Ehrenberg, as by previous naturalists, among infusoria, are now generally regarded as vegetable (see **DESMIDEÆ** and **DIATOMACEÆ**); whilst others, as the *cercarie* (q.v.), have been discovered to be immature states of entozoa. The *rotifera* (q.v.) are now also, by very general consent, widely separated from the *polygastrica* of Ehrenberg, for which alone the term infusoria, although not unobjectionable (see **ANIMALCULE**), is retained; the term *polygastrica* (Gr. many-stomached) being rejected, because it expresses a view of the structure of these creatures which is generally deemed erroneous. Agassiz has gone the length of proclaiming an opinion, not received by other naturalists, that the infusoria are all immature or larval worms. But of the forms at present known, it is at all events probable that many are those of immature creatures; it is certain that some species assume very different forms at different stages of their existence; and the whole life-history of no one species is fully known.

Some of the infusoria are large enough to be individually visible to the naked eye, but most of them are altogether microscopic. Their bodies are composed of *sarcode*, a glutinous diaphanous substance, of which the outer layer sometimes forms a more or less resisting integument. The body has some well-defined form, of which the varieties are very great in different species. Many are furnished with *cilia*, the motion of which carries them with great rapidity through the fluid in which they live, and by means of which also currents are created in the fluid to bring food to the mouth. The mouth is very generally surrounded or largely provided with cilia. Whether these organs are under the control of will, or maintain their motion without will or even consciousness on the part of the creature, like the cilia of the epithelium in higher animals, is not determined. There is an analogy in favor of the latter opinion, and many appearances—which, however, the phenomena of zoospores, etc., teach us to regard as possibly deceptive—in favor of the latter. Some infusoria, instead of cilia, have a few slender filaments, which they agitate with an undulatory movement; others move by contractions and extensions of their bodies. Some have stiff bristle-like organs, which they use as feet for crawling on the surfaces of other bodies; and some have hooks, by which they attach themselves to foreign bodies.

All infusoria have a distinct mouth, and many have also an anal opening, sometimes near the mouth, sometimes at the opposite extremity of the body. Between these, Ehrenberg imagined that he could trace an intestine, straight in some, variously bent in others, with which along its course many small stomachs are connected; whilst in the infusoria having only one aperture, he supposed all the stomachs to open immediately from it. But other observers have failed to find the canal and stomachs, although Ehrenberg's experiments, by means of fluids colored with indigo and carmine, have been often repeated. And it seems probable that the food taken into the mouth is simply conveyed into the midst of the soft gelatinous substance of the body, being formed into pellets as it passes from the mouth through a kind of gullet in the firmer integument. The food of infusoria consists of organic particles of various kinds, and different species have been remarked to show a preference, like those of higher animals, for particular kinds of food. Many of them feed on microscopic plants and on other infusoria. Their great use in the economy of nature is probably to consume organic particles, the decomposition of which would otherwise be baneful to all life, and the return of which by decomposition to their primitive elements would diminish the fertility and wealth of the world. The numbers of the infusoria are prodigious. They are found in all parts of the world, and both in fresh and salt water, in stagnant ponds and ditches, in mineral and hot springs, and in moist situations. Any infusion or other liquid containing vegetable or animal matter, if left exposed to the atmosphere, is sure

to be full of them. Their multitudes are so great that leagues of the ocean are sometimes tinged by them. Some, which, instead of swimming freely, like most of their class, become surrounded with a gelatinous substance, are found adhering together in masses sometimes 4 or 5 in. in diameter, although the individual animals are so small that a cubic inch of the mass may contain 8,000,000 of them. The infusoria contained in a single cup of putrid water may exceed in number the whole human population of the globe!

The organization of the infusoria is still very imperfectly known. There appears in many of them a cavity not far from the mouth, the *contractile space*—variously regarded as a cavity without proper walls, or as a vesicle—from which branches sometimes radiate through the substance of the body, and which, being capable of contraction and expansion, is regarded by some as the center of a kind of vascular system. It is with considerable probability regarded as furnished with proper walls. There is also, probably in all the infusoria, another organ, evidently of great importance, although its use is still uncertain, called the *nucleus*, which is usually roundish or a little elongated, sometimes much elongated and band-like. It is enveloped in a membrane, and is more compact than the surrounding substance. In the multiplication of these animals by spontaneous division, a fission of the nucleus always takes place. Each of the halves becomes furnished with a complete mouth, set of cilia, and other organs. The division, in the same species, is sometimes longitudinal, sometimes transverse, perhaps alternately longitudinal and transverse. The multiplication of the infusoria in this way is extremely rapid. A *paramecium*, well supplied with food, has been observed to undergo division every 24 hours, from which would result 16,384 individuals in a fortnight, or 268,435,456 in four weeks. Reproduction also takes place by gemmation; buds or gemmules forming on the outer surface of the body, and gradually assuming the shape of the parent animal, although they do not attain to their full size till after separation. More extraordinary is another mode of reproduction by *encysting* or *encapsulation*. The animal contracts, closes its mouth, becomes surrounded by a viscid secretion, and finally by a membrane, becomes attenuated, and dissolves, all but the nucleus, into a mere liquid containing granules, which afterwards form within the cyst a new infusorium, different in form and appearance from that by which the cyst was produced. The metamorphoses of the infusoria have been traced to a certain extent in some kinds, but not fully in any. Whether any truly sexual propagation takes place has not been perfectly ascertained, although the observations of Balbiani have made it extremely probable as to some of them. A reproduction, different from all that has yet been mentioned, has been observed to take place in some, by the formation of internal germs, to which this character has been ascribed, but the subject is still involved in doubt; nor is it improbable that there may be amongst these minute creatures a production of real eggs, which has hitherto eluded observation.

In the integument of some infusoria, very minute fusiform bodies are thickly imbedded, called *trichocysts*, which are capable of throwing out long filaments. Their use is unknown, although they are supposed to be urticating organs. The filaments are thrown out when the animal is subjected to annoyance by the drying up of the liquid in which it lives, or by the application of some irritating liquid.

INFUSORIA, FOSSIL. See DIATOMACEÆ.

INGALLS, RUFUS, b. Maine, 1820; graduated at the U. S. military academy, 1843; joined the army. In 1845 he was transferred to the dragoons, and in 1848 to the quartermaster department with the rank of capt. In 1854 he became col. and assistant quartermaster-general. In 1860 he was ordered from the frontier, where he had long served as quartermaster with his regiment, to Washington, where, at the beginning of the rebellion, 1861, he was appointed chief quartermaster of the volunteers to provide for the supplies of the army of the Potomac and of the army of the James. He discharged his duties with great ability, fidelity, and promptness. Mar. 13, 1865, he was made maj.gen. of volunteers for meritorious services in the rebellion; and in 1867 became quartermaster of the military division of the Atlantic at New York.

INGAÚNI, a tribe dwelling on the mountains and seacoast of Genoa in the 1st and 2d c. B.C. They were active in the wars between the Romans and Ligurians, and were allies of the Carthaginians in the second Punic war. They were regarded as a distinct tribe in the time of Pliny and Strabo, but after the battle with Emilius Paulus, 181 B.C., in which they lost 15,000 men, very little was heard of them. The town Albenga, then called Albium Ingaurium, was their capital.

INGBERT, or SANCT INGBERT, a t. of Germany, in Bavaria, in the Palatinate, on the Roorbach, noted for its coal, iron, and quicksilver mines, and the manufacture of iron, glass, and chemicals. Pop. about 9,000.

IN'GELOW, JEAN, b. England, 1830; published her first volume, *Poems*, in 1863, and gave evidence of original talent. Among the poems in this volume, "Divided," "High Tide on the Coast of Lincolnshire," and the "Songs of Seven," have been very popular. Her subsequent poems have sustained her reputation as a highly gifted poet. She has published also several prose works, as *Studies for Stories*; *Home Thoughts and Home Scenes*; *Off the Skelligs*, and others. Her verses are characterized by simplicity

and naturalness. They have had a very large sale in America. She now resides in London.

INGEMANN, BERNHARD SEVERIN, one of the most distinguished poets and novelists of Denmark, was b. May 28, 1789, in the island of Falster. His literary career may be divided into three distinct periods. The first of these, extending from 1811 to 1814, embraces his best lyrical productions, viz., the collection of poems entitled *Progne* (1812), and the allegorical epic of *De Sorte Riddere* (1814); while the second, or dramatic, ending in 1822, was marked by the appearance of numerous tragedies, which have maintained their place on the national stage, and among which the best are his *Masaniello*; *E'lanca Rösten i Oerken* (1815); *Hyrden af Tolosa*; *Reinald*; *Underbarnet*; *Loveridderen* (1816); and *Tasso's Befriede* (1819). After this period, Ingemann's writings are characterized either by leaning to historical disquisition, or a strongly religious bias. His admirable epic poem of *Valdemar den Store og Hans Mænd* (1824) was the prelude to the various historical novels in which, taking Walter Scott for his model, he endeavored to portray the social life and habits of his own country in the middle ages. *Valdemar Seier*, the first of the series (1826), and *Erik Menved's Burndom* (1828), which are generally regarded as the best of these productions, may compete favorably with some of the most successful efforts of his great model; while even in the less popular of his historical novels, *Kong Erik og de Fredlose* (1833), and *Prinds Otto og Hans Samtid* (1835), may justly entitle him to rank among the first novelists of his time. The poems of *Dronning Margrete* (1836) and *Holger Danske* (1837), which are based, like his novels, on incidents of Danish national history and tradition, rank among Ingemann's most successful efforts. The religious element in this writer's mind has found expression in various productions of considerable merit—as, for instance, in his collection of anthems and psalms, *Høejmesepsalmer* (1825), in his rendering of some of the symbolical or traditional legends of the church in his *Blade af Jerusalem's Skomager's Lonnebog* (1833); *Salomon's Ring* (1839); and in his allegorical poem, *Guldæblet* (1856). Ingemann held the chair of aesthetics and Danish literature at the royal academy of Soroe, near Copenhagen. His collective works have been published in 38 vols., 1857, Copenhagen, and the greater number of his prose works and many of his poems, have been translated into various languages. He died 1862.

INGENHOUSZ, JAN, 1730-99; b. in Holland; studied and practiced medicine in Holland, but removed to London in 1767. Accident brought him an introduction to the Austrian imperial family, whom he served professionally with such success that he was named by the empress Maria Theresa aulic counselor and physician to the imperial family, with a pension of £600 per annum. He devoted much time and study to general scientific research and experiments in electricity, and in regard to the composition and relation of different gases. It is claimed that he made the first medical use of carbonic acid, and that he invented the plate electrical machine. He was greatly esteemed by the emperor Joseph II., and was consulted by the most distinguished personages in Vienna. Ingenhousz wrote a number of scientific treatises and essays, some of which were published separately, and others in the *Journal de Physique* and other periodicals. He practiced inoculation in small-pox with distinguished success, and gained a widespread reputation for his skill in this direction.

INGERMANNLAND, or INGRIA. See ST. PETERSBURG, GOVERNMENT OF, *ante*.

INGERSOLL, a t. of Oxford co., Ontario, Canada, on the Thames river, and on the Great Western railroad, 85 m. w.s.w. of Toronto; pop. '71, 4,022. It exports largely grain and lumber, and has several manufactories of machinery, woolen goods, agricultural implements, cheese, and wooden ware; 2 banks, 7 churches, several hotels, and 2 newspapers. It is a place of growing importance.

INGERSOLL, CHARLES J., an American statesman, was b. in Philadelphia, Oct. 3, 1782. His father, Jared Ingersoll, was an active partisan in the American revolution, and a member of the convention which adopted the federal constitution. Charles J. Ingersoll received a liberal education, which was completed by European travel. In 1801 he produced the tragedy of *Edroy and Elgira*, and in 1808 a strong political pamphlet in defense of the democratic policy of Mr. Jefferson, and a satirical review of American politics, entitled *Inchiquin's Letters* (1810). He was elected to congress in 1812; and in 1814 he advocated the principle that "free ships make free goods," in a powerful speech. He was for 14 years United States district attorney for Pennsylvania, and in congress from 1839 to 1849. He published two series of *Historical Sketches of the War of 1812*, in 1845 and 1852. A speech in opposition to the Lincoln administration caused his arrest in 1862; but his popularity made it advisable to release him after a brief detention. He died in May, 1862.

INGERSOLL, CHARLES ROBERTS, LL.D., b Conn., 1821. After graduating at Yale college, 1840, and at the Yale law school, 1844, he practiced law in New Haven. He was several times a member of the general assembly, and in 1873, '74, and '75 was elected by the democratic party governor of the state.

INGERSOLL, JARED, LL.D., 1749-1822; b. Conn.; graduated at Yale in 1766, studied law for five years in London, and after spending a year and a half in Paris, settled in Philadelphia, where he became prominent as a lawyer. In 1780 he was a mem-

ber of congress, and in 1787 represented Pennsylvania in the convention which framed the constitution of the United States. He was also attorney-general of the state, and at the time of his death was presiding judge of the district court of Philadelphia county.

INGERSOLL, JOSEPH REED, LL.D., D.C.L.; 1786-1868; son of Jared; b. Philadelphia; graduated at the college of New Jersey in 1804, and for many years practiced law in Philadelphia, where he became eminent in his profession. He was a member of congress 1835-37, and again in 1842-49. In 1850-53 he was minister to England. He was an excellent public speaker. Of his published pamphlets the most important was *Secession a Folly and a Crime*, which appeared at the outbreak of the rebellion.

INGERSOLL, ROBERT G., b. Dresden, N. Y., 1833; the youngest of five children of a Congregational minister. The family removed west in 1845, and settled in Illinois, and there Robert studied law; was admitted to the bar, and entered into politics as a democrat. In 1857 he removed to Peoria, where he soon became recognized as an able lawyer, chiefly employed in railroad litigation. In 1860 he was nominated for congress, but was defeated. In 1862 he entered the war as col. of the 11th Illinois cavalry, and was taken prisoner, but exchanged. He returned to citizenship a republican in politics, and was appointed by Gov. Oglesby attorney-general of Illinois in 1868. In 1876, at the republican presidential convention at Cincinnati, he electrified the audience, and, through them and by means of the press and the telegraph, impressed the entire country with his fervid and vigorous speech in favor of James G. Blaine. From this time Col. Ingersoll was recognized as one of the foremost natural orators of the country. He soon after entered the lecture field, where the matter as well as the manner of his discourse excited public attention. He developed the views of a pronounced opponent to Christianity as a system; and, adopting religious topics as his subjects, attacked the inspired character of the Bible, the personal nature of the Deity, the existence of a hell, with all the force of which he was capable, and with the advantage of rhetorical powers scarcely equaled. There have been few instances of the exercise of freedom of speech in religious matters which could be compared to that of Col. Ingersoll. Yet, despite his recognized ability as a dialectician, and his surprising and persuasive gifts of oratory, there has been no evidence that his influence as a controvertist or a skeptic has extended beyond the immediate period of his address. Col. Ingersoll married Miss Eva Parker in 1862, and has two daughters. He has been president of several railroad companies; but, since devoting himself to public lecturing, has resided in Washington.

INGHAM, a co. of Michigan; 576 sq.m.; pop. '70, 25,268. The surface is nearly level; the soil fertile, and coal and iron ore are found. The staple products are grain, maize, oats, wool, hay, and cattle. The chief articles of manufacture in numerous factories are carriages, machinery, brick, saddlery, doors, sash and blinds, furniture, and woolen goods. There are also flour and saw mills and tanneries. Several railroads traverse the co. and center at Lansing. Cap., Mason.

INGHAM, BENJAMIN; 1712-72; b. England. In 1733 he was associated with the two Wesleys, the founders of Methodism, and in 1735 accompanied John Wesley to Georgia. Returning, he visited the Moravians in Germany, and founded in Yorkshire congregations of Moravian Methodists, which in a few years increased to 84. He was afterwards elected a bishop of that church; but finally, with most of the societies which he had formed, joined the Sandemanians.

INGHAM, CHARLES C.; 1796-1863; b. Ireland; distinguished himself as a painter, gaining at the early age of 21 from the Dublin academy the prize for the "Death of Cleopatra." In 1817 he settled in New York, where he excelled as a portrait-painter, and was one of the founders of the national academy of design, of which he was vice-president 1845-50. Among his admired paintings, besides his portraits, are "The Flower Girl," "Day Dream," "The Laughing Girl," and "White Plume."

INGOLSTADT, or INGOLDESTADT (anciently *Aureatum*, and by the Latin writers of the 16th c. called *Auripolis* and *Chrysopolis*—i. e., "the golden city"), a t. and fortress of Upper Bavaria; is situated in a fertile district on the left bank of the Danube, which is here crossed by a stone bridge; 46 m. n.w. of Munich. It contains three parish churches (two Catholic and one Protestant), a hospital, and a castle. Cloth, playing-cards, and leather are manufactured, and breweries and a trade in corn are carried on; pop. '75, 14,474.

Ingolstadt is an ancient, melancholy-looking town, too large for the number of its inhabitants. A university was founded here in 1472, which reckoned Reuchlin, Aventin, and other eminent scholars among its professors; it was removed, however, to Landshut in 1800, and to Munich about six years after. At this university, in the 16th c., Urb. Rhiegus, the poet, known by the name of Dr. Faustus, studied. Ingolstadt was the first German town at which the Jesuits were permitted to establish themselves, and to teach publicly from the university chairs. Loyola gave it the fond title of "his little Benjamin." After the suppression of the order in 1773, Adam Weishaupt established here the order of the illuminati (q. v.). In 1827 the fortifications of Ingolstadt, which had

been destroyed by the French in 1800, were restored upon a large scale, the two forts on the left bank of the river being especially distinguished for their elegance and strength.

INGRAHAM, DUNCAN NATHANIEL; b. South Carolina, 1802. Entering the U. S. navy as midshipman in 1812, he became capt. in 1855. Commanding the sloop of war *St. Louis* in the Mediterranean in 1853, he interfered with the arrest, by the Austrian consul at Smyrna, of Martin Koszta, a Hungarian, who had declared in New York his intention of becoming an American citizen. The government approved the course of capt. Ingraham, and congress requested the president to present him a medal. He was made in March, 1856, chief of the bureau of ordnance and hydrography, and held the position until Feb. 4, 1861, when he resigned his commission in the navy, and became chief of ordnance, construction, and repair in the confederate navy.

INGRAHAM, JOSEPH II., 1809-61; b. Maine. After a brief period in mercantile pursuits, he became a teacher in Washington college, near Natchez, Miss. In 1836 he published *The Southwest by a Yankee*, and afterwards *Lafitte; Burton, or the Sieges; Capt. Kyd; The Dancing Feather*, and some other popular romances. Subsequently he was ordained an Episcopal minister, and took charge of a parish and school at Holly Springs, Miss. His last and most important works were *Prince of the House of David; Pillar of Fire; and Throne of David*, a series of works of fiction based upon the Old and New Testament histories, and intended to illustrate the Bible.

INGRAILED'. See ENGRAILED.

INGRES, JEAN DOMINIQUE AUGUSTE, an eminent French painter, was b. at Montauban, Sept. 15, 1781, studied under David (q.v.), and subsequently went to Rome. Here he resided for fifteen years, after which he spent four years in Florence, by which time his fame was so well established that he was called to the school of fine arts in Paris as the successor of Denon. In 1834 he succeeded Horace Vernet as director of the academy at Rome, and in 1845 he was made commander of the legion of honor. Among his compatriots his reputation is now firmly established. Ingres occupies a sort of middle place between the classic and romantic schools, but rather inclines to the former. Among his numerous pieces may be mentioned "Raphael et la Fornarina," "Romulus, Vainqueur d'Aeron," "Virgile lisant son Eneide à Auguste et à Octavie," "La Mort de Léonard de Vinci," "Le Vœu de Louis XIII," "L'Apothéose d'Homère," "Stratonice," "Jésus au Milieu des Docteurs," "Molière dans son Cabinet," and "L'Apothéose de Napoléon I," with a motto flattering the late emperor of the French, *In nepote redixivis*. At the Paris exhibition of 1855 Ingres had a whole salon to himself. In 1862 he was raised to the dignity of senator and made a member of the imperial council of public instruction. He died in 1867.

INGRES, JEAN DOMINIQUE AUGUSTE [From Supplement], one of the most eminent painters of the French school, was b. at Montauban, Sept. 15, 1781. A casual view of a copy of one of Raphael's pictures inspired him (so it is said), at the age of ten, with the ambition to become a painter: he forthwith began to study drawing: and after having been successively the pupil of a M. Roques and of M. Briant, a landscape-painter, he went to Paris in his 17th year, and entered the studio of the great painter David. He remained with David as a pupil for four years. He carried off the second prize for painting at the academy of the fine arts in 1800, and in the following year he took the first—an honor which has scarcely, in any other case, been awarded to so young an artist. The picture which gained for him this high distinction was "The Arrival of the Intercessors at the Tent of Achilles." It is now at the school of fine arts, and unquestionably it compares well with many of the works which have made him famous. In 1802 he exhibited two portraits, which still rank among his finest works of this class; in 1804 he exhibited a portrait of the first consul, and also a portrait of himself. He again painted Napoleon, now become emperor, in 1806, and the picture was bought for the hôpital des invalides. In 1806 he set out for Rome, where he continued to live for many years. He seems to have made a reputation in Italy early, and the commissions he received, including several from the pope, prove that his reputation stood very high. From his countrymen, however, the pictures which he sent to Paris for many years met only with neglect or ridicule. It was at Florence, where he resided from 1820 to 1824, that he painted a picture which at length gained him a party of enthusiastic admirers among the Parisians. The picture was "Le Vœu de Louis XIII." It was exhibited at the Louvre in 1824, and though much derided as well as much admired, it still raised Ingres, previously almost unnoticed, at a bound to the chief place among French idealist painters of that time. He received from Louis XVIII. the cross of the legion of honor; and he was forthwith appointed to succeed baron Denon as professor at the academy of the fine arts.

Now that he had become the acknowledged head and representative of a school of art, it was natural that his work should be subjected to a searching criticism, more eager to detect faults than discover merits. He brought upon himself a perfect tempest of discussion in 1827 by a work called "L'Apothéose d'Homère," which his admirers declared to be a masterpiece; while the party of his detractors—then numerous and influential—condemned it as bad in drawing, as poor in coloring, and especially as being

ungraceful, coarse, and even vulgar in conception. The French critics seem now to be agreed not only that this was Ingres's finest attempt at epic painting, but that it places him at the head of the French school, and on the level of the greatest painters the world has seen. Many foreign judges, however, are disposed to hold that the strictures originally made upon it were to a large extent well founded. The discussion which it originated ranged over all the painter's work; it was renewed year after year, and the bitter expressions of some of his critics made such an impression upon Ingres, that from 1832 to 1834 he exhibited nothing but two portraits, and in the latter year embraced an opportunity which offered of again establishing himself in Italy. He became director of the French academy at Rome, a post which has been held by many distinguished artists, and in which his predecessor was Horace Vernet. This time he remained in Italy for about ten years. During these years he sent many pictures to be exhibited at Paris: these gradually wrought upon the public taste; and when he returned, he found his countrymen unanimous and enthusiastic in admiration of him, and in raptures about his latest composition—"Cherubini [the composer] Inspired by the Muse." Since then it has been treason in Paris to breathe a doubt about the greatness of Ingres. The state ratified the decision of the public by the liberality with which it bestowed its honors upon him. He was made an officer of the legion of honor in 1841, a commander in 1845, and grand officer in 1855; he was named a senator on May 25, 1862; and he was soon after appointed a member of the imperial council of public instruction. He became a member of the institute in 1825. Many of his works are now in public collections. At the Paris exhibition of 1855 a room was set apart for his pictures, and one of two grand medals of honor was awarded to him—Eugene Delacroix getting the other. He continued to exercise his art almost to the close of his life; and whatever may be thought of the success of his higher aims, he showed himself to the last what he had always been, the most painstaking, conscientious, and learned of painters. The Naiad which he painted in 1861 ("La Source"), and which was his solitary contribution to the London exhibition of 1862, is considered the finest of his later works; it was enthusiastically admired, even by those who strongly dissented from the praises lavished by his countrymen upon his more ambitious undertakings. He died, after a short illness, Jan. 14, 1867. During the summer an exhibition of his works took place in Paris, at which almost all his pictures and the cartoons for his works in stained glass and mural paintings were brought together.

"L'Apothéose d'Homère," "Le Martyre de St. Symphoena," "La Naissance de Venus Anadyomène," "La Source," "L'Odalisque," and the portrait of M. Bertin, ainé, may be mentioned as among the most characteristic—they are certainly among the most admired—of the works of Ingres. His admirers—who are at present the whole body of his countrymen—recognize in him, among modern painters, the most faithful and persevering and the most successful student of the traditions of the renaissance; they declare his paintings equal in power and fidelity to the best works of the great masters. On the other hand, it is maintained by his censors or detractors that Ingres was deficient in invention and in refinement; that all the good things in his works have been borrowed from ancient pictures; and that, moreover, he copied badly from his models, and often spoiled what he borrowed by his setting of it. Such censures appear greatly exaggerated; but it may be confidently said that Ingres is at present worshiped by his countrymen with a somewhat blind veneration; and that they would do well to expend upon a few really great works the admiration which they lavish upon everything that proceeded from him.

INGRIA. See ST. PETERSBURG, GOVERNMENT OF.

INGROSSING, or ENGRASSING, a deed means, in law, the writing it out in full and regular form on parchment or paper for signature. The person who engrosses is usually a law-stationer or clerk. In Scotland the corresponding term is "extending a deed," and the name of the person who does so must be named in the testing clause, which is not necessary in England.

INGULPH, abbot of Croyland, long considered the author of the *Historia Monasterii Croylandensis* (History of the Monastery of Croyland or Crowland, in Lincolnshire), is supposed to have been b. in London about 1030 A.D. According to the account of his life in his history, he studied oratory and philosophy at Oxford; became a favorite of Edgitha, the wife of Edward the confessor; visited duke William of Normandy at his own court in 1051; and, after a disastrous pilgrimage to the holy land, entered a Norman monastery. Here he remained till 1076, when he was invited to England by the conqueror, and made abbot of Croyland, where he died Dec. 17, 1109. The *Historia Monasterii Croylandensis* was printed by Savile at London in 1596, and in a more complete edition by Gale at Oxford in 1684. It has been translated into English for Bohn's antiquarian library by Riley. Some writers even of the last century questioned the entire genuineness of the book; but their skepticism did not proceed further than the hypothesis of interpolations by a later writer; but in 1826 the late sir Francis Palgrave, in an article in the *Quarterly Review*, endeavored to prove that the whole so-called history was little better than a novel, and was probably the composition of a monk in

the 13th or 14th century. His conclusions have been, on the whole, almost universally adopted.

INHALATION, in medicine, a term used to signify the breathing into the lungs of vapors or gases for producing anaesthesia, or for more strictly curative purposes. The inhalation may be accomplished in a variety of ways. The ordinary manner of administering chloroform or ether is to fold a napkin in the form of a funnel and moisten the interior with a dram of chloroform or a half ounce of sulphuric ether, and apply it to the nostrils and mouth of the patient, admitting a certain quantity of fresh air at the same time. The napkin may be folded in such a manner as to accomplish this, or it may be occasionally partially removed. The quantity of the anaesthetic may be renewed when necessary. There are various forms of apparatus rendering the operation more certain for those whose experience is not great, and, as a rule, they are to be considered desirable. The inhalation of nitrous oxide gas should always be performed with well-made apparatus, and this substance should be carefully purified before it is taken into the lungs. The steam, or rather the vapor of hot water, is employed in throat diseases, often affording great relief; and medicinal substances, such as iodine, chlorine, and camphor are sometimes used in conjunction, but it is often desirable to use the watery vapor without any combination. A very convenient, and, in the absence of other apparatus, the only available way, is to place a funnel over an open vessel containing hot water, and inhale the hot vapor through the spout. A deep vessel, such as a two quart earthen pitcher, may be used, holding a pint of boiling water—the patient breathing from the open mouth, putting his face close over the vessel, with care to moderate the heat of the contents. The vapor of iodine is often found beneficial in affections of the throat or lungs, and this may be inhaled by using the alcoholic tincture, or the solid substance may be put into a wide-mouth bottle, from which the patient may inhale the vapor, which, if the quantity is sufficient, will be afforded rapidly enough at ordinary temperature. If the quantity used is small, it may be slightly warmed. The vapor of caustic acid is often beneficial as an inhalant, and may be administered in a similar manner. There are various kinds of apparatus for inhalation, with the common object of introducing vapor to the lungs in the proper strength or temperature, and due admixture of air.

INHAMBAN', or **INHAMBÁNA**, a Portuguese town of East Africa, 200 m. n.e. of Delagoa bay, and near the mouth of the Inhamban river; pop. 6,500. It exports wax, ivory, copal, oil-nuts, and india-rubber.

INHERITANCE. See HEIRS, INTESTACY, WILL, SUCCESSION.

INHIBITION, in Scotch law, is a writ which is issued in order to prohibit a person from alienating his heritable estate until the debt of the creditor is paid.

INHIBITION, in physiology. See NERVOUS SYSTEM.

INIA, *Inia Boliviensis*, a cetaceous animal of the family *delphinidae*, in form resembling a dolphin, with a long and slender snout. It is the only known species of its genus, and is one of the few cetacea which inhabit fresh water. It is found in some of the upper tributaries of the Amazon, and in the lakes near the Cordilleras. It is from 7 to 12 or 14 ft. long. The inia feeds chiefly on fish. It is pursued for the sake of the oil which it yields. It is generally found in little troops of three or four. The females show great affection for their young.

INITIALS. Though in general it is usual and regular in all legal deeds and writings for a party to write his full Christian name and surname, yet in many cases, especially in documents of a mercantile nature, signature by initials will bind equally with the full signature.

INJECTIONS. This term is applied in medicine to fluids thrown into the passages or cavities of the body by means of a syringe or elastic bag. The fluids thus injected into the rectum or lower bowel are termed clysters (q. v.). The injection of a dilute solution of salt into the veins has been found to be of great service in even advanced cases of Asiatic cholera. The injection of blood into the veins is described in the article TRANSFUSION OF BLOOD.

INJECTOR, GIFFARD'S, is now in general use for feeding water into steam-boilers, particularly locomotive boilers. Feed-pumps are difficult to keep in order when driven at high speed. The very rapid action of the valves severely tries their durability. In the case of locomotives, inconvenience was often occasioned by the fact that their feed-pumps acted only when they were running; and thus, if an engine happened to stand still for any length of time, the water occasionally got too low in the boiler. The injector acts equally well whether the engine is running or at rest.

The diagram fig. 1 will give an idea of the essential parts of the injector. A is the steam-boiler, B being the water-level, CDF a pipe into which steam is admitted: this pipe terminates in a cone DF, which is inclosed in a larger cone HH. In the cone DF,

the pointed plug E can be raised or lowered so as to increase or diminish the area of the aperture at its lower end F. G is a pipe communicating with the water-cistern, and admitting water into the external cone HH. K is a pipe communicating with the boiler under the water-level. On opening communications between the boiler and this apparatus, it might be expected that steam would rush out at F, and water at K, both currents meeting with great force, and escaping into the atmosphere between the two openings. Paradoxical as it may appear, the outflowing stream of water at K, although it is actually flowing under a greater pressure than the current of steam escaping at F, due to the head of water arising from the difference of level between the aperture at K and the water-level at B, is overpowered, and driven back into the boiler; and not only is the outflowing current of steam at F able to drive back the stream of water trying to escape at K, but the torrent of steam drags with it a large quantity of water with which it comes into contact as it is passing through the cone HH. This water finds its way into the cone HH, through the pipe G, from the tender or cistern, and constitutes the feed-water. The steam rushing from the aperture at F will necessarily be condensed by the cold water with which it comes into contact in the cone HH. The explanation offered of the action of this apparatus is as follows. The opening at F, through which the steam escapes, has

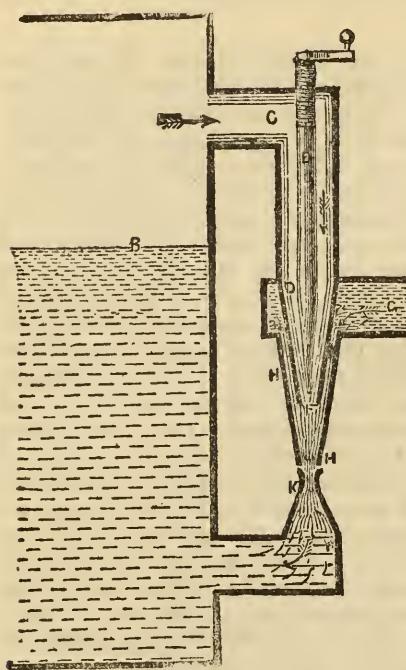

FIG. 1.

nearly twice the area of the opening into which the water is to be forced at K. The opening in the cone HH is also larger than the aperture at K, and it appears that the mechanical power contained in the flow of steam from F is, as it were, transformed from a large area to a smaller, with a corresponding increase in its intensity. This diminution of its volume arises from its condensation by the cold water through which it has to rush in the cone HH. We get thus the mechanical power due to a column of large area concentrated into a small area, with a corresponding increase in its velocity, and to this increase of velocity is due the fact that a current issuing at FH will enter at K, in spite of the counter-pressure at K. The injector for feeding boilers is rather an expensive apparatus, in consequence of the number of adjustable parts required to be provided. Variations in the pressure of steam require alterations in the area of the steam-passage, and in the distances between the mouths of the conical openings for the outflow and inflow of steam and water.

Fig. 2 shows in section a simple form of injector for raising water. Steam issuing from the pipe S, into the vessel WR, will draw the water through the pipe T, and force it up through the narrow neck below R. to a height of about one foot for every pound of pressure per square inch. It is doubtful if those injectors can work so economically, as regards expenditure of steam, as ordinary slow-moving pumps; but they possess many conveniences and advantages, which are bringing them into use.

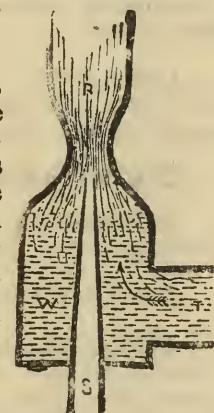

FIG. 2.

INJUNCTION, a writ in English law, by which the chancery division of the high court of justice stops or prevents some inequitable or illegal act being done. The writ is peculiar, in general, to chancery, though to a limited extent it was introduced into common law. If the party disobeys the injunction, he may be attached for contempt of court, and imprisoned till he obeys. If he obeys it, he may apply to have the injunction dissolved. In Scotland a remedy of a similar kind is called an interdict (q.v.).

INJUNCTION (ante), in legal practice, a writ of a court with equity jurisdiction, addressed to a party or parties defendant, commanding the performance or non-performance of some specific act. It is either prohibitory or mandatory: in the one case forbidding a certain act, in the other commanding something to be done for instance, it may either forbid the creation of a threatened nuisance, or enjoin its removal if established. It is borrowed from the Roman law, which, under the name of 'interdict,' had a very wide application. A court of chancery, having assumed jurisdiction of a case, will, if necessary, enjoin the defendant from taking the same action before a court of law. But for the exercise of this power on the part of a chancellor, conflicts of jurisdiction, detrimental to the public welfare and vexations to private citizens, might often arise. It is a rule of chancery courts, however, not to grant injunctions where litigants have an available remedy in courts of law. An injunction is either temporary or perpetual. A temporary injunction is issued upon *ex parte* evidence, and is designed to bring both parties into court for an impartial hearing. If it appear that there was

no just warrant for the injunction, it will be dissolved; if it be found to rest upon equitable grounds, it will be made perpetual. Injunctions are often employed to prevent infringements of patents, copy-rights, and trade-marks, and in some special cases to restrain breaches of covenants and agreements. If a judgment for debt have been obtained, and the defendants afterwards discover the plaintiff's receipt for the sum laid in the declaration, the latter may be prevented by injunction from levying upon the goods of the former to satisfy such judgment. Where the party enjoined disregards the injunction he will be punished for contempt by the court upon application by the plaintiff.

INK. The most important kinds of ink may be included in the two following heads — *Writing Ink* and *Printing Ink*.

1. *Writing Ink*.—The composition of the ink used by the ancients is not well understood; it is, however, certain that their ink exceeded ours in blackness and durability. Mr. Underwood (who read a paper upon the subject of ink before the society of arts in 1857) thinks that some old ink was merely a carbon pigment, like the Indian ink of the present day, while other kinds were veritable dyes of iron and acids (true chemical compounds), with the addition of a good deal of carbon.

The essential constituents of ordinary black ink are galls, sulphate of iron (popularly known as green vitriol or green copperas), and gum; and the most important point is the regulation of the proportion of the sulphate of iron to the galls. If the former is in excess, the ink, although black at first, soon becomes brown and yellow. The gum is added to retain the coloring matter in suspension, and to prevent the mixture from being too fluid. The following prescription by prof. Brande yields a very good ink: "Eoil six ounces of finely bruised Aleppo galls in six pints of water, then add four ounces of clean and well crystallized sulphate of iron, and four ounces of gum-arabic. Keep the whole in a wooden or glass vessel, occasionally shaken. In two months, strain, and pour off the ink into glass bottles." The addition of a little creasote is useful as a check to the formation of mold. Stephens's ink—a blue liquid, which in a few hours after its deposition on paper becomes of an intense black—is one of the most popular of our writing fluids. It consists essentially of gallotannate of iron, *dissolved* in sulphate of indigo, while in ordinary ink the coloring matter is merely *suspended* by means of the gum. Runge, a German chemist, has discovered a simple and cheap black writing fluid, prepared from chromate of potash and a solution of logwood, which possesses the properties of forming no deposit, of adhering strongly to the paper, of being unaffected by exposure to water or acids, and of neither acting on, nor being acted on by steel pens.

Various receipts for *indelible inks* have at different times been published. Dr. Normandy asserts that the ink obtained by the following combination cannot be obliterated or defaced by any known chemical agent: 24 lbs. of Frankfort black (which is supposed to be a charcoal obtained from grape and vine lees, peach kernels, and bone-shavings) must be ground with mucilage, formed by adding 20 lbs. of gum-arabic to 60 gallons of water, and the mixture strained through a coarse flannel; four lbs. of oxalic acid are then added, together with as much decoction of cochineal or sulphate of indigo as will give the required shade.

Red Inks are of two kinds, one variety consisting essentially of the tinctorial inatter of Brazil-wood, and the other being prepared from cochineal or carmine. Stephens's red ink, which is one of the best of these preparations, is obtained as follows: "Add to a quantity of common carbonate of potash, soda, or ammonia, twice its weight of crude argol in powder. When the effervescence has ceased, decant or filter the solution from the insoluble matter. To this fluid add by measure half its quantity of oxalate of alumina, prepared by dissolving damp, newly precipitated alumina in as small a quantity as possible of a concentrated solution of oxalic acid. The mixture thus prepared is next colored, when cold, with bruised or powdered cochineal, and after standing for 48 hours, is strained, when it is fit for use." (Muspratt's *Chemistry*, vol. ii. p. 378.)

Blue Inks are now chiefly made either directly or indirectly from Prussian blue. Stephens's unchangeable blue ink is formed by dissolving this salt (which should be first well washed in a dilute mineral acid) in an aqueous solution of oxalic acid. Ink of which Prussian blue is the basis, is unaffected by any of the numerous physical causes which operate injuriously on black ink, unless it be exposed to a strong light, when the iron (which exists as a sesquioxide in Prussian blue) becomes deoxidized, and causes the color of this ink to fade; but on removing the writing from the influence of light, the color is restored.

Purple, green, and yellow inks have been formed, by various chemists, but they are not of sufficient importance to claim a notice in this article.

Sympathetic Inks leave no trace of color upon the paper, but when exposed to heat or chemical action of some kind, become more or less distinctly apparent. The following are a few of the principal kinds of this class of compounds. On writing with a solution of sugar (acetate) of lead or of ternitrate of bismuth, and washing the paper with a solution of hydrosulphuric acid (sulphureted hydrogen), the letters come out *black*. On writing with a solution of nitrate of cobalt, and washing the paper with a solution of oxalic acid, the letters come out *blue*. On writing with a solution of subacetate of lead, and washing the paper with a solution of iodide of potassium, the letters come out *yellow*.

low; or on writing with a dilute solution of chloride of copper, and gently heating the paper, the letters which were previously invisible assume a beautiful *yellow* tint, which disappears on cooling. On writing with a solution of arsenite of potash, and washing the paper with a solution of nitrate of copper, the letters come out *green*.

2. *Printing Ink* is a soft glossy compound, altogether different in its composition from the inks which have been already described. The following are, according to Mr. Underwood (in the paper already referred to), the necessary conditions of a good printing ink: 1. It must distribute freely; 2. It must have much greater affinity for the paper than for the type; 3. It must dry almost immediately on the paper, but not dry at all on the type or rollers; this is a great desideratum, especially for newspapers; 4. It should be literally proof against the effects of time and chemical reagents, and should never change color. It is prepared by boiling the best linseed oil in an iron pot, kindling and allowing it to burn for a short time; by this operation the oil acquires the necessary drying quality. After being again boiled resin is dissolved in it, in order to communicate body to the fluid, which now somewhat resembles Canadian balsam. The coloring matter—which is lampblack for black ink; carmine, lake, vermillion, etc., for red ink; indigo or Prussian blue for blue ink; lemon and orange chrome (chromate and bichromate of lead), or gamboge, for yellow ink, etc.—is then added to the hot mixture, and the whole is drawn off, and finally ground into a smooth uniform paste.

In lithography a *writing* and a *printing ink* are employed, both of which differ altogether from the compounds already described. The writing ink is composed, according to Muspratt, of the following materials: shellac, soap, white wax, and tallow in certain proportions, to which is added a strong solution of gum-sandarach, and it is colored with lampblack; while the printing ink, which is employed to take impressions on paper from engraved plates, with a view to their transference to the stone, is composed of tallow, wax, soap, shellac, gum-mastic, black pitch, and lampblack.

INK (*ante*). *Ancient Inks.*—The inks of the ancients had nothing in common with ours except the color and the gum employed for obviating too great fluidity. Employing broader-pointed pens than ours they required thicker inks, and though the composition of these inks is not fully understood, yet it is certain that they excelled ours in both richness and stability of color. Ample testimony to these characteristics is borne by existing papyri, whose age is more than 4,000 years, and by the brown leather and white vellum MSS., of an age exceeding 3,000 years, which are now treasured in the museums of Europe. While some of these inks were pigments, like the India and Chinese inks of to-day, others seem to have been actual dyes of iron and acids, with the addition of a good deal of ivory-black, lampblack, soot, or other form of carbon. From Persius and Ausonius, we learn that the Romans made use of the juice of the cuttle-fish, or sepia, which abounded in the Mediterranean. Most elegant manuscripts written in golden and silver inks have come down to our day; and also a few written wholly in red ink, made of vermillion, purple, or cinnabar, though red was more frequently used for headings of books, chapters, and pages. The emperors of Constantinople were wont to sign the acts of their sovereignty with red ink, and their first secretary was guardian of the vase containing the cinnabar or vermillion, which only the emperor might use. Green ink, though rarely found in charters, often occurs in Latin manuscripts, especially those of later years. It was also used by the guardians of the Greek emperors, before their wards obtained their majority. Blue or yellow inks, fortunately, were seldom employed in manuscripts; and in his *Origin and Progress of Writing*, Thomas Astle said that he had neither found nor heard of the use of yellow ink during the past 600 years.

INKBERRY, *Ilex glabra*, a shrub belonging to the holly family (*aquifoliaceæ*). Leaves evergreen, an inch or more long, wedge-lanceolate or oblong, sparingly toothed toward the apex, of a beautiful dark green color, smooth and shining on the upper surface. peduncles, half an inch or more in length, the sterile ones being from 3 to 6 flowered, the fertile ones solitary and producing small black berries. The shrub is from 2 to 4 ft. high and grows upon sandy soils along the coast of the United States from Cape Cod to Florida. The leaves and bark have been used as a remedy in intermittent fever, but do not possess much power. Its principal use is for decoration, as a constituent in bouquets. It is brought to New York and Philadelphia in quantities from southern New Jersey.

INKERMANN, a small Tartar village in the Crimea, is situated near the eastern extremity of the harbor of Sevastopol. It is memorable for the battle which took place there, during the Russian war, between an army of Russians 60,000 strong, and detachments of allied forces, consisting of about 14,000 troops actually engaged. At about 6 o'clock on the morning of Nov. 5, 1854, the Russians, who had marched westward from Sevastopol, along the southern shore of the harbor, and whose movements were concealed by the darkness and a thick, drizzling rain, appeared crowding up the slopes of the plateau to the s., on which the allies were posted. Here a handful of men, about 1400 strong, a portion of the "household guards," made a most heroic stand for six consecutive hours against a body of Russians that was probably ten times as numerous. Reinforcements, both English and French, coming up to the rescue, the Russians were finally driven from the field.

INLAND BILL of exchange means a bill of exchange drawn by and upon persons living in the same country. The rules applicable to foreign bills differ in some respects from those applicable to inland bills. By a recent statute, all bills drawn by persons in England on persons in Scotland or Ireland, and *vice versa*, are to be treated as inland bills.

INLAYING is the art of decorating flat surfaces by the insertion of similar or different materials; thus, wood of one color is decorated by inlaying with others of different colors: to this kind of inlaying the French term *marqueterie* is now generally applied. Metal of one kind is inlaid with other kinds, and often very beautiful effects are produced. When steel is inlaid with gold or brass, it is usually called Damascene work. One variety produced in India is called Kuft-gori—in this, the inlaid metal, usually gold, occupies more of the surface than the metal forming the ground. Another beautiful variety of Indian inlaying is called Tutenague or Bedery-work, which consists in making the article to be inlaid, most frequently a hookah bowl, of an alloy consisting of copper one part to pewter four parts. This is hard, but is easily cut; the pattern is then engraved, and little pieces of thin silver cut to the desired forms are dexterously hammered into the spaces thus cut out to receive them. Ivory, pearl, shell, bone, tortoise-shell, are favorite substances for inlaying wood; and stone or marble is inlaid with an immense variety of colored stones. In the art of stone-inlaying, the Florentines have long held the palm; their favorite work is black marble, with inlaid figures of brilliant-colored stones; this work is called *pietra dura*, or Florentine work. Very beautiful work of this kind, excelling the Florentine, is now made in the imperial works at St. Petersburg, where the art has of late been sedulously cultivated by the Russian government. This art was always a favorite one in Delhi and Agra, where some of the most exquisite work is still produced. Usually, in the Indian work, white marble forms the ground-work, and the figures are formed of carnelian, jasper, agate, jade, lapis-lazuli, and other costly hard stones. No stone-inlaying has ever rivaled the inlaid marble walls of the celebrated Taj Mahal, the tomb of the sultana of Shah Jehan, at Agra. The designs are very artistic, the execution almost marvelous, and the harmony of color produced by the different stones employed is most beautiful. Many other materials than those mentioned are used for inlaying; and there is a style of inlaid-work in which small squares of colored stone, glass, or pottery are made to form pictorial and artistic decorations; this is called mosaic-work (q.v.).

INLET, an arm of the sea open only on one side, and stretching into the land, is distinguished from a bay (q.v.) only by its smaller size, as a haven is, again, by still smaller dimensions, distinguished from an inlet. Examples of inlets are seen in the indentations of the w. coast of Norway; as of bays in the deeper and wider indentations of the coast of Italy.

INMAN, HENRY, 1801-46; b. N. Y.; an eminent painter. With a preference for the military profession he intended to enter the academy at West Point, but on seeing at Jarvis's studio Wertmüller's picture of Danae his purpose was changed; he became a pupil of Jarvis, and early excelled in miniature painting. He afterwards devoted himself to portraits, and also to landscape, genre, and history. He spent some time in Boston and Philadelphia. His health failing, he visited England in 1844, where he painted portraits of Chalmers, Wordsworth, and Macaulay. On his return he began for the national capitol a series of historical pictures, one of which was "Daniel Boone of Kentucky," but which was unfinished at his death. Among his best works were the portraits of chief-justice Marshall and bishop White, his "Rip Van Winkle awaking from his Dream," "Mumble the Peg," and "Boyhood of Washington." He was made vice-president of the national academy of design. He had a fine literary taste, and wrote several valuable sketches.

INMAN, JOHN O'BRIEN, son of Henry, an artist. From the west, where he had gained a reputation as a portrait painter, he came to New York and opened a studio. His flower-pieces and genre pictures have been much admired, and found a ready sale. He went to Italy in 1866.

INN (ancient *Oenus*), a river of Germany, the most important Alpine affluent of the Danube, rises in the s. of the Swiss canton of Grisons, at a height of 4,293 ft. above sea-level, and flowing n.e. through that canton forms the valley of the Engadine. It maintains generally a n.e. course to its junction with the Danube. Leaving Switzerland, it enters the Austrian dominions at the village of Finstermünz, flows through the crownland of Tyrol, and crosses the s.e. angle of Bavaria, after which, forming the boundary between Bavaria and upper Austria, it enters the Danube at Passau, after a course of 285 miles. Its principal affluent is the Salza from the south. It is regularly navigable from the town of Hall, 8 m. below Innsbruck. At its junction with the Danube the Inn is broader than the Danube itself.

INN—INNKEEPER (see HOTEL). In point of law, an inn is merely a house of entertainment for travelers, which any person may set up without license like any other trade. It is when excisable liquors are sold that a license is required. Public-houses and ale-houses are, however, synonymous terms with inns, for the innkeeper almost invariably finds it expedient to obtain the necessary license to sell spirits and beer. As to these

licenses, see BEER ACTS and PUBLIC-HOUSES. The rights and duties of innkeepers irrespective of the license will here be noticed. It may be observed, in the first place, that though public-houses are always inns, yet beer-houses are not so, the latter being merely shops for selling beer and a few other liquors, the distinguishing characteristic of the public-house being, that refreshment as well as lodging may be had on the premises by all comers. Taverns are chiefly places for the sale of wines and liquors; victualing-houses, for the sale of victuals; coffee-houses and hotels are also varieties, all of which may or may not be inns, according as they do or do not hold themselves out to give meat, drink, and lodgings to all travelers; and it is not at all necessary that any sign-board be put up to distinguish the inn.

One of the incidents of an innkeeper is that he is bound to open his house to all travelers without distinction, and has no option to refuse such refreshment, shelter, and accommodation as he possesses, provided the person who applies is of the description of a traveler, and able and ready to pay the customary hire, and is not drunk or disorderly, or tainted with infectious disease. He is, of course, bound only to give such accommodation as he has. If the traveler has a horse and luggage, the innkeeper is bound to receive these also, if he has accommodation, provided the traveler himself intends to lodge there as a guest. But the traveler is not entitled to select whatever room he pleases, and if he will not accept such reasonable accommodation as is offered, the innkeeper can order him to leave the house. As some compensation for this compulsory hospitality, the innkeeper is allowed certain privileges; thus, he has a lien on the horse and carriage or goods of the guest for that part of the bill or reckoning applicable to each respectively—i.e., he can keep these until he is paid for the keep, even though they are not the property of the guest. But he cannot detain the person of his guest until payment is made, for, if so, a man might be imprisoned for life without any legal process or adjudication. While, however, an innkeeper has this remedy for his score, he is also liable to great responsibility for the safety of his guests and their goods. By the Roman law, under the *edit nautæ, caupones, stabulariæ*, he was bound to restore safely whatever goods of his guests were intrusted to him, unless some *dannum fatale*, or some act of God, prevented his doing so. This rule has been adopted by the law of England. Hence, if the guest be robbed of his goods at the inn, the innkeeper is liable, unless the robbery was caused by the guest's servant or companion, or by his own gross negligence, as, for example, by leaving a box containing money in the commercial room, after exposing its contents to the bystanders. So the innkeeper will be excused if the guest took upon himself the charge of his own goods, yet the guest does not take that charge by merely accepting from the landlord the key of the room, though that may be an element in the question. A guest who takes all reasonable precaution—as, for example, locking his room-door—and is yet robbed, has therefore a good claim on the landlord for indemnity; and the landlord will not escape liability by putting up a notice in his rooms that he will not be answerable for such losses, otherwise guests would have no protection, for they are very much at the mercy of the keepers of such houses. It has been attempted to extend the common-law liability of innkeepers for the safety of the goods of their guests to ordinary lodging-house keepers, but the courts have held that an ordinary boarding-house keeper or lodging-house keeper is only responsible for ordinary care, i.e., such care as he takes of his own goods. He must, it is true, be careful in selecting his servants, but he is not bound absolutely to return the goods safe merely because they were in his house along with the lodger.

In Scotland the Roman rule of law as to the responsibility of innkeepers for the safety of the guest's goods has been also adopted, and the other heads of law are substantially the same as in England, except that no indictment would lie in Scotland against an innkeeper for refusing a guest. But the substantial remedies are the same.

INN—INNKEEPER (*ante*). The meaning attached to these terms in this country is almost if not quite identical with that which they bear in England. The duties and responsibilities of innkeepers to their guests are also the same in principle in both countries. The only difference is that in many of the American states an innkeeper who provides a safe for the use of his guests, and notifies them that they should place therein their "moneys, jewels, and ornaments," is not responsible for the loss of such articles if the guest neglect to avail himself of this means of safety. The man who merely takes his meals in a public restaurant attached to an inn is not a guest of the inn itself; his rights are merely those of a casual boarder. An innkeeper may entertain boarders as well as travelers, but his responsibility for the safety of the goods of the former is not the same as that which he assumes in the case of the latter. He is responsible not merely for the traveler's personal baggage, but for all the goods received into his custody; and if they are lost or destroyed by any agency except "an act of God"—by which is meant lightning, storm, earthquake, or anything outside of the ordinary course of events—he must pay for them. Of course if the traveler lose his goods by his own carelessness or that of his servant, the innkeeper is not responsible.

INNATE IDEAS. See COMMON SENSE.

INNER HOUSE, the name given in Scotland to the higher divisions of the court of session (q.v.).

INNER TEMPLE, one of the four inns of court in London having the exclusive privilege of calling persons to the English bar. See INNS OF COURT.

INNES, THOMAS, the author of *A Critical Essay on the Ancient Inhabitants of Scotland*, was the second son of James Innes of Drumgask, in the parish of Aboyne, and co. of Aberdeen. He was b. at Drumgask in the year 1662, and at the age of 15 was sent by his father, a zealous Roman Catholic, to be educated at the university of Paris. He was ordained priest in 1691, and took his degree as master of arts in 1694. He continued in France for some years, discharging his ecclesiastical duties, and assisting his elder brother, Lewis, principal of the Scots college at Paris, in arranging the valuable records which had been deposited there by James Beaton, the last Roman Catholic archbishop of Glasgow. In 1698 Innes returned to Scotland, and officiated as a missionary priest at Inveravon, in the old diocese of Murray. He again went to Paris in 1701, and passed the rest of his life at the Scots college, with the exception of one or more visits which he made to Britain. The great object of his life was to write the true history of Scotland, and to refute the fabulous narratives which had been hitherto generally received by his countrymen. The latter part of his task was fully accomplished by his *Critical Essay*, which was published at London in 1729, in 2 vols. He had prepared himself for the work by a careful study of all the materials which he could find in the libraries of France, and of the books, whether printed or in manuscript, which he was able to consult during his journeys to England and Scotland. In the winter of 1724 he was seen by Wodrow, who had one feeling at least in common with him, and who thus refers to him in his *Analecta*: "There is one father Innes, a priest, brother to father Innes of the Scots college at Paris, who has been in Edinburgh all this winter, and mostly in the advocates' library in the hours when open, looking at books and manuscripts. He is not engaged in politics, so far as can be guessed; and is a monkish, bookish person, who meddles with nothing but literature." In the *Critical Essay*, Innes examined the authorities on which depended what was then generally received as the history of Scotland, and showed how little reliance was to be placed upon them. But not content with overthrowing fable, he pointed out what the true history was, and where it was to be found. The difficulties in the way of this inquiry were very great. Even at the present day, when most of the materials for Scottish history have been printed, it is no easy matter for the student to examine them. In Innes's time they were for the most part in manuscripts, whose very existence was unknown except to a few antiquaries. Every subsequent writer on this portion of Scottish history has admitted the high merit and the practical usefulness of Innes's work. He gave his ready assistance to all who were engaged in pursuits similar to his own, particularly to bishop Keith in his *History of Scotland* and his *Catalogue of Scottish Bishops*, and to Dr. Wilkins in his *Concilia Magnae Britanniae et Hiberniae*. To this last work he also contributed a valuable letter on the ancient form of holding synods in Scotland. Innes died at Paris on Jan. 28, 1744, in the 82d year of his age. The *Critical Essay* has now become a comparatively scarce work, but has never been reprinted. It was intended by its author to be an introduction to a *Civil and Ecclesiastical History of Scotland*. One volume of this *History* was prepared by its author for the press, extending from the introduction of Christianity to the death of St. Columba in 597; and another volume was also left in an incomplete state, bringing down the narrative to the year 821. The whole was printed in one volume by the Spalding club in 1853, under the editorship of Mr. Grub. Imperfect as it is, it forms a valuable addition to our historical literature, being distinguished by the same learning, acuteness, and moderation for which the *Critical Essay* is so remarkable. As has recently been observed, its author loved truth better even than he loved his church. A full biographical notice of Innes, and an account of his various works, will be found in the preface to his *Civil and Ecclesiastical History*.

INNESS, GEORGE, b. N. Y., 1825; a landscape painter. He came to New York at the age of 16 to study engraving, but on account of ill health returned to his parents, then living in Newark, N. J. The next four years he spent at home, painting and sketching; and again coming to New York, he passed a month in Gignoux's studio. He visited Europe twice, spending some time in Italy. After his return he lived in Boston. In 1862 he went to Eagleswood, N. J., where for a time he practiced his art. His work is in the style of Rousseau. Many of his landscapes are greatly admired. Among his best pieces are "The Sign of Promise," "Peace and Plenty," "A Vision of Truth," "Going Out of the Woods," "Passing Storm," "Summer Afternoon," "Twilight," "Sunshine and Shadow," "The Apocalyptic Vision of the New Jerusalem and River of Life," and "Light Triumphant." He now lives in Boston.

INNISCATTERY. See SCATTERY ISLAND.

INNISHERKIN, a small island on the s. coast of Ireland, belonging to the co. of Cork, from the shore of which it is separated by a channel a quarter of a mile in width, is about 1 m. n.e. of Clear island. It is well cultivated, and contains some good slate-quarries. Pop. upwards of 1000.

INNOCENT, the name of 13 popes, the most remarkable of whom are the following. **INNOCENT I.**, a native of Albano, was elected bishop of Rome in 402. Next to the pontificate of Leo the great, that of Innocent I. forms the most important epoch in the

history of the relations of the see of Rome with the other churches, both of the east and of the west. Under him, according to Protestant historians, the system of naming legates to act in the name of the Roman bishop in different portions of the church originated; while Catholics at least admit that it received a fuller organization and development. He was earnest and vigorous in enforcing the celibacy of the clergy. He maintained, with a firm hand, the right of the bishop of Rome to receive and to judge appeals from other churches, and his letters abound with assertions of universal jurisdiction, to which Catholics appeal as evidence of the early exercise of the Roman primacy, and from which dean Milman infers that there had already "dawned upon his mind the conception of Rome's universal ecclesiastical supremacy, dim as yet and shadowy, yet full and comprehensive in its outline" (*Latin Christianity*, i. p. 87). Innocent I. died in 417.

INNOCENT III. (LOTHARIO CONTI), by far the greatest pope of this name, was b. at Anagni in 1161. After a course of much distinction at Paris, Bologna, and Rome, he was made cardinal; and eventually, in 1198, was elected, at the unprecedentedly early age of 37, a successor of pope Celestine III. His pontificate is justly regarded as the culminating point of the temporal as well as the spiritual supremacy of the Roman see; and it is freely avowed by the learned historian of Latin Christianity, that if ever the great idea of a Christian republic, with a pope at its head, was to be realized, "none could bring more lofty or more various qualifications for its accomplishment than Innocent III." (iv. p. 9). Accordingly, under the impulse of his ardent but disinterested zeal for the glory of the church, almost every state and kingdom was brought into subjection. In Italy, during the minority of Frederick II. (son of the emperor Henry VI., king of Italy), who was a ward of Innocent's, the authority of the pope within his own states was fully consolidated, and his influence among the other states of Italy was confirmed and extended. In Germany he adjudicated with authority upon the rival claims of Otho and Philip; and a second time he interposed effectually in behalf of his ward, Frederick II. In France, espousing the cause of the injured Ingerburga, he compelled her unworthy husband, Philip Augustus, to dismiss Agnes de Meranie, whom he had unlawfully married, and to take back Ingerburga. In Spain he exercised a similar authority over the king of Leon, who had married within the prohibited degrees. The history of his conflict with the weak and unprincipled John of England would carry us beyond the space at our disposal. If it exhibits Innocent's character for consistent adherence to principle, and his lofty indifference to the suggestions of expediency, in a less favorable point of view than his other similar contests, it at the same time displays in a stronger light the extent of his pretensions and the completeness of his supremacy. In Norway he exercised the same authority in reference to the usurper Swero. In Aragon he received the fealty of the king Alfonso. Even the king of Armenia, Leo, received his legates, and accepted from them the investiture of his kingdom. And, as if in order that nothing might be wanting to the completeness of his authority throughout the then known world, the Latin conquest of Constantinople, and the establishment of the Latin kingdom of Jerusalem, put an end, at least during his pontificate, to the shadowy pretensions of the eastern rivals of his power, spiritual as well as temporal. Pursuing consistently the great idea which inspired his entire career, his views of the absoluteness of the authority of the church within her own dominion were no less unbending than his notion of the universality of its extent. To him, every offense against religion was a crime against society, and, in his ideal Christian republic, every heresy was a rebellion which it was the duty of the rulers to resist and repress. It was at his call, therefore, that the crusade against the Albigenses was organized and undertaken; and although he can hardly be held responsible for the fearful excesses into which it ran, and although at its close he used all his endeavors to procure the restitution of the lands of the young count of Toulouse, yet it is clear from his letters that he regarded the undertaking itself not merely as lawful, but as a glorious enterprise of religion and piety. As an ecclesiastical administrator, Innocent holds a high place in his order. He was a vigorous guardian of public and private morality, a steady protector of the weak, zealous in the repression of simony and other abuses of the time. He prohibited the arbitrary multiplication of religious orders by private authority, but he lent all the force of his power and influence to the remarkable spiritual movement in which the two great orders, the Franciscan and the Dominican (q.v.), had their origin. It was under him that the celebrated fourth Lateran council was held in 1215. In the following year, he was seized with his fatal illness, and died in July at Perugia, at the early age of 56. His works, consisting principally of letters and sermons, and of a remarkable treatise *On the Misery of the Condition of Man*, were published in two vols. folio (Paris, 1682). It is from these letters and decretals alone that the character of the age, and the true significance of the church-policy of this extraordinary man, can be fully understood; and it is only from a careful study of them that the nature of his views and objects can be realized in their integrity. However earnestly men may dissent from these views, no student of mediaeval history will refuse to accept dean Milman's verdict on the career of Innocent III., that "his high and blameless, and, in some respects, wise and gentle character, seems to approach more nearly than any one of the whole succession of Roman bishops to the ideal light of a supreme pontiff," and

that "in him, if ever, may seem to be realized the churchman's highest conception of a vicar of Christ" (*Latin Christianity*, iv. 277).

INNOCENT XI. (BENEDETTO ODESCALCHI), elected in 1676, was one of the most distinguished among the popes of the 17th century. He was a vigorous and judicious reformer, and his administration is entirely free from the stain of nepotism, which had sullied the fame of many of his predecessors. But his historical celebrity is mainly owing to his contest with Louis XIV., which illustrates as well the personal character of the pontiff, as the peculiar spirit of the age. The dispute began from an attempt on the part of the pope to put an end to the abuse of the king's keeping sees vacant, in virtue of what was called the *Droit de Regale*, and appropriating their revenues. The resistance to this attempt drew forth the celebrated declarations of the French clergy as to the Gallican liberties. See **GALLICAN CHURCH**. But the actual conflict regarded the immunities enjoyed by the foreign ambassadors residing in Rome, and especially the right of asylum, which they claimed not only for their own residences, but also for a certain adjoining district of the city. These districts had gradually become so many foci of crime, and of frauds upon the revenue; and the pope, resolving to put an end to so flagrant an abuse, gave notice that, while he would respect the rights of the existing ambassadors, he would not thereafter receive the credentials of any new ambassador who should not renounce these abusive claims for himself and his successors. The great powers murmured at this threat, but it was with France that the crisis occurred, on the death of the maréchal d'Estrées. The pope renewed his notice in May, 1687. Louis XIV., on the other hand, instructed his new ambassador to maintain the dignity of France, and sent a large body of military and naval officers to support his pretensions. Innocent persisted in refusing to grant an audience to the ambassador. Louis, in reprisal, seized on the papal territory of Avignon, and threatened to send a fleet to the coast of the papal states, but Innocent was immovable; and in the end, the ambassador was compelled to return with his credentials unopened, nor was the dispute adjusted till the following pontificate. Innocent died in 1689.

INNOCENTS, HOLY, FEAST OF, one of the Christmas festivals, held in the western church on Dec. 28, and in the eastern on the 29th, under a title similar to that of the Latin festival. It is intended to commemorate the massacre of the children "from two years old and upward" at Bethlehem. See **HEROD**. These children are referred to as martyrs by St. Cyprian, and still more explicitly by St. Augustine; and it is to them that the exquisite hymn of Prudentius, *Sulcete Flores Martyrum*, is addressed. The concurrence of the east and west in celebrating the festival is an evidence of its antiquity. In the modern church this feast is celebrated as a special holiday by the young, and many curious customs connected with it prevail in Catholic countries. One of these is, that in private families the children are on this day privileged to wear the clothes of the elders, and in some sort to exercise authority over the household in their stead. So also, in communities of nuns, the youngest sister becomes for this day superioress of the house, and exercises a sort of sportive authority even over the real superiors.

INNOMINATE ARTERY, *Arteria innominata*, is the first large branch given off from the arch of the aorta. It varies from an inch and a half to two inches in length, and divides into the right carotid and the right subclavian arteries. See **CIRCULATION. ORGANS OF**. This artery, through which all the blood to the right side of the head and neck, and to the right arm, flows, has been tied by several surgeons for aneurism of the right subclavian, but the operation has never been successful. An important fact has, however, been established, viz., that the circulation of the blood in the parts supplied by this large vessel is re-established by anastomosis (q.v.) after the operation.

INNOMINATE BONE. See **PELVIS**.

INNOVATION, or Novation, a name sometimes given in the law of Scotland to the exchange or substitution of one obligation for another. It is in effect taking a fresh security.

INNS OF COURT, the name given in England to certain voluntary societies which have the exclusive right of calling persons to the English bar. There are four such societies in London, viz., the inner temple, the middle temple, Lincoln's inn, and Gray's inn. Each of these inns possesses certain smaller inns, which are mere collections of houses or chambers, as Clifford's inn, new inn, Furnival's inn, etc. The four inns are each governed by a committee or board, called the benchers, who are generally queen's counsel or senior counsel, self-chosen, i.e., each new bENCHER is chosen by the existing benchers. Each inn has also a local habitation, consisting of a large tract of houses or chambers, which are in general occupied exclusively by barristers, and sometimes by attorneys, and are a source of great wealth. Each inn is self-governing, and quite distinct from the others, all, however, possessing equal privileges; but latterly they have joined in imposing certain educational tests for the admission of students. It is entirely in the discretion of an inn of court to admit any particular person as a member, for no member of the public has an absolute right to be called to the bar, there being no mode of compelling the inn to state its reasons for refusal. But, practically, no objection is ever

made to the admission of any person of good character. Each inn has also the power of disbarring its members, that is, of withdrawing from them the right of practicing as counsel. This right has been rarely exercised, but of late years there have been examples of persons abusing their profession, and indulging in dishonest practices; in such cases, the inn has its own mode of inquiring into the facts affecting the character of a member, and is not bound to make the investigation public. By this high controlling power over its members, a higher character is supposed to be given to the bar as a body, than if each individual was left to his own devices, unchecked, except by the law. See BARRISTER.

INNSBRUCK, capital of the Tyrol, is charmingly situated on the Inn, at its junction with the Sill, at the height of 1900 ft. above sea-level, in the midst of a valley, surrounded by mountains ranging from 6,000 to 9,200 ft. high. It lies on the right bank of the Inn, and is connected with the suburb of St Nicolaus, on the left bank, by a wooden bridge, from which the name of the town (*Inn's Brücke*, Ger. the Inn's Bridge) is derived. The Inn is also crossed by a chain bridge a little below the town. The Franciscan church, or *hofkirche*, architecturally uninteresting, is remarkable for its elaborate monument to the emperor Maximilian I., which, though constructed at the request of Maximilian, and intended for his burial-place, does not contain his remains. The monument consists of a marble sarcophagus supporting the emperor's effigy in bronze, in a kneeling posture; while on both sides of the aisle are rows of monumental bronze figures, 28 in number, representing a variety of distinguished personages, male and female. In this church, on Nov. 3, 1651, Christina (q.v.) of Sweden was solemnly received into the Roman Catholic church. The other chief buildings are the Ferdinandum, a museum containing a collection of the productions of the Tyrol in art, literature, and natural history; and the university (founded in 1672, and, after several vicissitudes, organized anew in 1825), with faculties, which has now upwards of 500 students and about 70 professors and lecturers. Innsbruck carries on important manufactures of woolen cloth, silk, gloves, ribbons, and carved work, as well as a flourishing transit trade. It is connected with Munich by railway, and a railroad across the Breuner pass, completed in 1867, unites Innsbruck with Botzen and Verona. Pop '69, 16,810.

INNUENDO, a part of a pleading in cases of libel and slander, pointing out what and who was meant by the libelous matter or description.

INNUIT. See *ESQUIMAUX, ante.*

INO, in Grecian mythology, was the daughter of Cadmus and Harmonia. Athamas king of Thebes, having divorced Nephele, whom he had married by the command of Juno, then married Ino, who bore him two sons, Learchus and Melicertes. Ino, jealous of Pirixus and Helle, the sons of Nephele, as her sons' rivals to the throne, sought to destroy them. This so enraged Juno that she made Athamas mad, who in his frenzy killed his son Learchus. Ino, fleeing with Melicertes in her arms, pursued by her husband, leaped into the sea, and was changed by the gods into a sea-goddess under the name of Leucothea. The story of Ino is used with many variations by Sophocles and other Greek dramatists.

INOCARPUS (*I. edulis*), the *mape* or *rata* of the South sea islands, is a tree important to their inhabitants for its fruit, a nut covered with a thin fibrous husk, which supplies a considerable part of their food, and is sometimes called the South sea island chestnut. The fruit is pulled in a green state, and roasted. The tree is a very beautiful one, of stately growth and fine foliage; the leaves oblong, 6 or 8 in. long, evergreen, but of delicate texture. It is one of those which, as they advance in age, instead of increasing uniformly in thickness, throw out buttresses to support the trunk. Small projections first appear, extending in nearly straight lines from the root to the branches, which finally become like so many planks covered with bark. The central stem continues for many years perhaps only 6 or 7 in. in diameter, whilst the buttresses, 2 or 3 in. thick, extend from it at the bottom, 2, 3, or 4 feet. These natural planks are used for paddles of canoes and other purposes.

INOCULATION. If the matter of a variolous (or small-pox) pustule, taken after the commencement of the eighth day, be inserted in or beneath the skin of a person who has not previously suffered from small-pox, the following phenomena are induced: 1. Local inflammation is set up; 2. At the end of six days there is fever similar to that of small-pox; and 3. After the lapse of three more days, there is a more or less abundant eruption of pustules. This process is termed inoculation, and the disease thus produced is denominated inoculated small-pox. The disease produced in this artificial manner is much simpler and less dangerous than ordinary small-pox; and as it was an almost certain means of preventing a subsequent attack of the ordinary disease, inoculation was much practiced till the discovery (about 1796*) of the antivariolous power of vaccination.

* This was the year in which Jenner inoculated his first case (the boy Phipps) with matter taken from the hand of a girl who had been directly infected by the cow. He was aware of the protective efficiency of cow-pox as early as 1770, and mentioned the circumstance in that year to his master, John Hunter.

The importance of inoculation was recognized in the east at a very early period. According to Dr. Collinson (*Small-pox and Vaccination Historically and Medically Considered*, p. 14), the Chinese had practiced this process from the 6th c., and the Brahmins from a very remote antiquity. In Persia, Armenia, and Georgia it was in use, and it is even said to have been employed in Scotland and Wales. It was not, however, till lady Mary Wortley Montagu wrote her celebrated letter from Adrianople in 1717 that the operation became generally known in this country. In that letter she writes: "The small-pox, so fatal and so general amongst us, is here entirely harmless, by the invention of *engrafting*, which is the term they give it. Every year, thousands undergo the operation. There is no example of any one who has died of it, and you may believe that I am well satisfied of the safety of this experiment, since I intend to try it on my dear little son." Four years afterwards, she had her daughter publicly inoculated in this country; the experiment was then performed successfully on six condemned criminals at Newgate, and on the strength of these successful cases, "the critical course was taken of inoculating two children of Caroline, princess of Wales, which gave a sanction to the practice."—Collinson, *op. cit.* p. 15.

Inoculation was not, however, thoroughly established for more than a quarter of a century after its introduction. It met with virulent opposition both from the medical profession and the clergy. A sermon is extant which was preached in 1722, by the rev. Edward Massey, in which it is asserted that "Job's distemper was confluent small-pox, and that he had been inoculated by the devil." The great drawback to inoculation turned out, however, to be this: while it was invaluable to him who underwent the operation, and completely guarded him from the natural disease in its severe form, its effect upon the community at large was extremely pernicious, in keeping alive the natural disease, and increasing its spread amongst those who were not protected by inoculation. While one in five or six of those who took the natural disease died, the average number of deaths at the inoculation hospital was only 3 in 1000; and yet, according to the authority of Heberden, in every thousand deaths within the bills of mortality in the first 30 years of the 18th c. (before inoculation was at all general), only 74 were due to small-pox. The deaths from this disease amounted to 95 in 1000 during the last 30 years of the century; so that, notwithstanding the preservative effects of inoculation on almost all who were operated on, the total number of deaths from this disease increased in 100 years in the ratio of about 5 to 4. Moore (*The History of Small-pox*, 1815) states that, at the beginning of the 18th c., about one-fourteenth of the population died of small-pox; whereas, at the latter end of the same century, the number (notwithstanding, or perhaps rather in consequence of, inoculation) had increased to one-tenth; and this immense consumption of human lives was not the total evil, for many survivors were left with the partial or entire loss of sight and with destroyed constitutions. From these remarks it will be seen that the benefits which were expected from inoculation were far from being realized, and small-pox would doubtless have gone on increasing in its destructive power, if it had not been checked by Jenner's invaluable discovery of vaccination (q.v.).

INOFFICIOUS TESTAMENT, a will made whereby near relatives have not been provided for by the testator.

INOSITE, or **PHASEOMANNITE** (Gr. *ινός*, muscle). $C_6H_{12}O_6$, a variety of glucose, or grape sugar, named from its occurrence in the muscular substance of the heart as first shown by Scherer. Cloetta found it in the lungs, kidneys, spleen and liver, and Müller in the brain. It is also contained in urine in *diabetes mellitus*, and in Bright's disease of the kidneys, and also in abundance in the vegetable kingdom, as in the unripe fruit of *phaseolus vulgaris*, green kidney beans, peas, cabbage, asparagus, and many other plants. By careful crystallization, it is obtained in beautiful rhombic tables resembling gypsum. In microscopic preparations it has the form of fine prismatic tufts. It readily dissolves in water, but is insoluble in alcohol or ether. It does not ferment under the influence of yeast, but with cheese, flesh, and decaying animal tissues in the presence of chalk, it undergoes lacteous fermentation—lactic, butyric, and carbonic acids being formed. Inosite is unchanged when heated with dilute mineral acids, and also when boiled in strong aqueous solutions of potash or baryta, without being colored. If inosite be evaporated nearly to dryness, and a small portion of calcium chloride and ammonia be added, upon re-evaporation a beautiful, characteristic rose color will be produced. See **SUGAR**.

INO'UYE KAYO'RU. A Japanese statesman b. in Choshiu. Sent to Europe by his daimio in 1863 to study, he returned in 1864 and endeavored, by acting as mediator to his clansmen, to prevent the bombardment of Shimonoseki in 1864. He was appointed minister of finance. He went to Corea, and negotiated the treaty with Corea, Feb. 27, 1876, after which he visited the centennial exposition at Philadelphia. He was appointed minister of foreign affairs, 1879. Under his conduct the treaties with Japan will be revised.

INOWRA'CLAW (called also JUNG BRESLAU, "Young Breslau"), a small t. of Prussia, in the government of Posen, is situated on an eminence in a fruitful plain, 26 m. s.s.e. of Bromberg. It is an ill-built town; contains many religious edifices; carries on a cou-

siderable trade, especially in brewing, distilling, and the manufacture of machinery; and has a pop. of, '75, 9,139.

IN PARTIBUS INFIDE'LIUM (Lat., "in the regions of the unbelievers"). Titular bishops in the church of Rome have been styled bishops *in partibus infidelium* since the 13th century. They are actual bishops, who have no diocese, and take their titles from places where there is now no bishop's see, but where there once was. This practice originated after the Greek schism, and became general in the time of the Crusades. The places conquered by the crusaders in the east were furnished with Roman Catholic bishops; but when these conquests were again lost, the popes continued to appoint and consecrate the bishops, as a continual protest against the power which had prevailed over their alleged right, and to signify their hope of restitution. The same policy has been pursued with regard to Protestant countries. But in Britain the assumption of territorial titles being illegal and dangerous, the Roman Catholic bishops actually resident have usually borne titles derived from distant places. Thus, till 1878, the bishop in Edinburgh was styled bishop of Abila. The Roman Catholic bishops in England were similarly designated from places abroad until 1850, when their assumption of titles from their actual sees gave prodigious offense to the church of England, and led to the passing of the *ecclesiastical titles bill*, which, however, remained a dead letter, and was repealed in 1871.

IN PERSONAM. See **IN REM.**

INQUEST. See **CORONER.**

INQUEST OF OFFICE, a process to put the king or the state in possession of escheated lands or tenements, goods or chattels. The case must be tried by a jury, not of any particular number of persons; it may be twelve, or more or less than that number, as may happen to be convenient. In this country the process is resorted to when real property is to be forfeited to the state for want of heirs. In states where aliens, by the operation of the common law, are not allowed to hold real estate, an inquest of office would be applicable to vest in the state the title to lands in their possession.

INQUISITION, in English law, is the return or report made by a sheriff or coroner as to the finding of a jury on matters inquired into.

INQUISITION, THE, called also the **HOLY OFFICE**, a tribunal in the Roman Catholic church for the discovery, repression, and punishment of heresy, unbelief, and other offenses against religion. From the very first establishment of Christianity as the religion of the Roman empire, laws, more or less severe, existed as in most of the ancient religions, for the repression and punishment of dissent from the national creed; and the emperors Theodosius and Justinian appointed officials called "inquisitors," whose special duty it was to discover and to prosecute before the civil tribunals offenses of this class. The ecclesiastical cognizance of heresy, and its punishment by spiritual censures, belonged to the bishop or the episcopal synod; but no special machinery for the purpose was devised until the spread, in the 11th and 12th centuries, of certain sects reputed dangerous alike to the state and to the church—the Cathari, Waldenses, and Albigenses—excited the alarm of the civil as well as of the ecclesiastical authorities. In the then condition of the public mind, however differently it is now constituted, heresy was regarded as a crime against the state, no less than against the church. An extraordinary commission was sent by pope Innocent III. into the s. of France to aid the local authorities in checking the spread of the Albigensian heresy. The fourth Lateran council (1215) earnestly impressed, both on bishops and magistrates, the necessity of increased vigilance against heresy; and a council held at Toulouse directed that in each parish the priest, and two or three laymen of good repute, should be appointed to examine and report to the bishop all such offenses discovered within the district.

So far, however, there was no permanent court distinct from those of the bishops; but under Innocent IV., in 1248, a special tribunal for the purpose was instituted, the chief direction of which was vested in the then recently established Dominican order. The inquisition thus constituted became a general, instead of, as previously, a local tribunal; and it was introduced in succession into Italy, Spain, Germany, and the southern provinces of France. So long, moreover, as this constitution remained, it must be regarded as a strictly papal tribunal. Accordingly, over the French and German inquisition of the following century the popes exercised full authority, receiving appeals against the rigor of local tribunals (Fleury, v. 266), and censuring, "or even depriving," the inquisitor for undue severity (*ibid.* 303). In France, the inquisition was discontinued under Philip the handsome; and though an attempt was made under Henry II. to revive it against the Huguenots, the effort was unsuccessful. In Germany, on the appearance of the Beghards (see BEGUINES), in the beginning of the 14th c., the inquisition came into active operation, and inquisitors for Germany were named at intervals by various popes, as Urban V., Gregory XI., Boniface IX., Innocent VIII., down to the reformation, when it fell into disuse. In England, it was never received, all the proceedings against heresy being reserved to the ordinary tribunals. In Poland, though established in 1327, it had but a brief existence. The history of the times of its introduction and of its discontinuance in the various states of Italy, would carry us beyond the limits at our command.

It is the history of the inquisition as it existed in Spain, Portugal, and their dependencies, that has absorbed almost entirely the real interest of this painful subject. As an ordinary tribunal similar to those of other countries, it had existed in Spain from an early period. Its functions, however, in these times were little more than nominal; but early in the reign of Ferdinand and Isabella, in consequence of the alarms created by the alleged discovery of a plot among the Jews and the Jewish converts—who had been required either to emigrate or to conform to Christianity—to overthrow the government, an application was made to the pope, Sixtus IV., to permit its reorganization (1478); but in reviving the tribunal, the crown assumed to itself the right of appointing the inquisitors, and, in truth, of controlling the entire action of the tribunal. From this date forwards, Catholic writers regard the Spanish inquisition as a state tribunal, a character which is recognized by Ranke, Guizot, Leo, and even the great anti-papal authority, Llorente; and in dissociating the church generally, and the Roman see itself, from that state tribunal, Catholics refer to the bulls of the pope, Sixtus IV., protesting against it. Notwithstanding this protest, however, the Spanish crown maintained its assumption. Inquisitors were appointed, and in 1483 the tribunal commenced its terrible career, under Thomas de Torquemada. The popes, feeling their protest unsuccessful, were compelled, from considerations of prudence, to tolerate what they were powerless to suppress; but several papal enactments are enumerated by Catholics, the object of which was to control the arbitrary action of the tribunal, and to mitigate the rigor and injustice of its proceedings. Unhappily, these measures were ineffective to control the fanatical activity of the local judges. The number of victims, as stated by Llorente, the popular historian of the inquisition, is positively appalling. He affirms that during the 16 years of Torquemada's tenure of office, nearly 9,000 were condemned to the flames. The second head of the inquisition, Diego Deza, in eight years, according to the same writer, put above 1600 to a similar death; and so for the other successive inquisitors-general. But Catholics loudly protest against the credibility of these fearful allegations. It is impossible not to see that Llorente was a violent partisan; and it is alleged that in his work on the Basque Provinces, he had already proved himself a venal and unscrupulous fabricator. Although, therefore, he has made it impossible to disprove his accuracy by appealing to the original papers, which he himself destroyed, yet his Catholic critics—as Hefele in his *Life of Cardinal Ximenes*—have produced from his own work many examples of contradictory and exaggerated statements; Prescott, in his *Ferdinand and Isabella* (iii. 467–470), has pointed out many similar instances; Ranke does not hesitate (*Fürsten und Völker der Süd. Europas*, i. 242) to impeach his honesty; and Prescott pronounces his “computations greatly exaggerated,” and his “estimates most improbable” (iii. 468). Still, with all the deductions which it is possible to make, the working of the inquisition in Spain and in its dependencies even in the new world, involves an amount of cruelty which it is impossible to contemplate without horror. When it was attempted to introduce it into Naples, pope Paul III., in 1546, exhorted the Neapolitans to resist its introduction, “because it was excessively severe, and refused to moderate its rigor by the example of the Roman tribunal” (Llorente, ii. 147). Pius IV., in 1563, addressed a similar exhortation on the same ground to the Milanese (*ibid.* ii. 237); and even the most bigoted Catholics unanimously confess and repudiate the barbarities which dishonored religion by assuming its semblance and its name.

The procedure of the inquisition deserves a brief notice. The party, if suspected of heresy, or denounced as guilty, was liable to be arrested and detained in prison, only to be brought to trial when it might seem fit to his judges. The proceedings were conducted secretly. He was not confronted with his accusers, nor were their names even then made known to him. The evidence of an accomplice was admissible, and the accused himself was liable to be put to the torture, in order to extort a confession of his guilt. The punishments to which, if found guilty, he was liable, were death by fire, as exemplified in the terrible Auto da Fé (q.v.), or on the scaffold, imprisonment in the galleys for life or for a limited period, forfeiture of property, civil infamy, and in minor cases, retraction and public penance. This form of procedure is strangely at variance with modern ideas; but it is fair to recollect that some of the usages were but the ordinary procedures in all the courts of the age, whether civil or ecclesiastical.

The rigor of the Spanish inquisition abated in the latter part of the 17th century. In the reign of Charles III., it was forbidden to punish capitally without the royal warrant; and in 1770 the royal authority was required as a condition even for an arrest. From 1808, under king Joseph Bonaparte, the inquisition was suppressed until the restoration; it was again suppressed on the establishment of the constitution in 1820; but it was partially restored in 1825; nor was it till 1834 and 1835 that it was finally abolished in Spain, its property being applied to the liquidation of the national debt.

The inquisition was established in Portugal in 1557, and its jurisdiction was extended to the Portuguese colonies in India. The rigor of its processes, however, was much mitigated in the 18th c., and under John VI. it fell altogether into disuse.

The inquisition in Rome and the papal states never ceased, from the time of its establishment, to exercise a severe and watchful control over heresy, or the suspicion of heresy, which offense was punished by imprisonment and civil disabilities; but of capital sentences for heresy, the history of the Roman inquisition presents few instances, and, according to Balmez (*On Civilization*, p. 153), that tribunal “has never been known

to order the execution of a capital sentence" for the crime of heresy. The tribunal still exists under the direction of a congregation, but its action is confined to the examination of books and the trial of ecclesiastical offenses, and questions of church law, as in the recent case of the boy Mortara; and its most remarkable prisoner in recent times was an oriental impostor, who, by means of forged credentials, succeeded in obtaining his ordination as a bishop.—See Llorente's *Istoria Crítica de la Inquisición*; Prescott's *Ferdinand and Isabella*; Hefele's *Der Cardinal Ximenes; eine Biographie*; Balméz, *Catholicism and Protestantism compared in Relation to Civilization*.

INQUISITION (*ante*). The first Christian emperors, following the example of their predecessors in regarding themselves as legal masters of all things within the empire, assumed the control of theological opinion and the punishment of errors therein. Constantine banished Arius, after his condemnation by the council of Nicaea, and ordered his books to be burned. He afterwards banished Athanasius. Constantius, 335, inflicted the same punishment on Hosius of Cordova because he refused to condemn Athanasius. Theodosius, having resolved to exterminate Arianism, compelled the archbishop of Constantinople to resign, directed his lieutenant to expel by force of arms all the Arian clergy from the churches, issued many edicts against all heretics, and was the first of the Christian emperors to inflict the penalty of death on a Christian because of heretical opinions. In the 8th c. synodal courts increased the facilities for detecting and punishing heresy.

The inquisition in FRANCE. In the latter part of the 12th c. various sects called heretical, such as the Cathari, Albigenses, and Waldenses, had increased so much, especially in the s. of France, that very vigorous measures to destroy them were deemed necessary. Papal legates, accordingly, were sent to assist in the work; and from that time the inquisition became a permanent institution. The work of seeking out and punishing heresy was systematically pursued. Two or three persons in each parish, and, if necessary, all the inhabitants, were made sworn agents in discovering those who were heretical, who held secret meetings, or forsook, in any particular, the prescribed course. They who refused to take the oath exposed themselves to the suspicion of heresy. Bishops who were not zealous in searching out the heretical were deprived of office; and, whether zealous or not, they were under the supervision of the legates, who in fact controlled the work. The commission, which the council of Toulouse required to be appointed in each parish, was to be employed exclusively in searching out heresies and in reporting them for trial and punishment. He who concealed the guilty forfeited his offices and lands. The house which sheltered them was to be destroyed. If they were sick, no physician was allowed to visit them. The penitent among them, clad in a peculiar garb, were driven from their homes, and, unless specially favored by the pope, were deprived of all office. But as, notwithstanding all these measures, heresy still prevailed, the inquisition was made a papal tribunal to which the bishops themselves were subjected and over which the monks of the Dominican order were appointed the permanent head. Their eagerness in the work soon gave popular currency to a satirical change of their name into *Domini canes* (the dogs of the Lord). The civil authority was made the executioner of the judgments which they pronounced. Persons who were even suspected of heresy were liable to imprisonment, accomplices and criminals were received as witnesses, the accused never saw his accusers nor was told who they were. Torture for compelling confession was at first allowed to be used only under the authority of the civil power; but afterwards, in order to maintain secrecy, the inquisitors themselves applied it at their pleasure. The jurisdiction and also the emoluments of the tribunal were enlarged by extending the meaning of the word *heresy* so as to include usury, fortune telling, insult to the cross, contempt of the clergy, and connection with leprous persons, Jews, and demons, demonolatry, and witchcraft. Those who recanted were condemned to practice penance of the severest kind, and were often deprived of all their privileges, rights, and property. Those who barely escaped conviction were imprisoned for life; and the obstinate and the relapsed were put to death at the stake by the secular arm. In 1252 Innocent IV. commanded that accused persons should be tortured not only to make them confess their own heresy, but also to reveal that of others.

In GERMANY the first inquisitor was Conrad of Marburg, who administered the office with great severity (1231–33). The sentences of death which he pronounced were all approved by the emperor, Ferdinand II., but were so vigorously opposed by the nobility and people that very few of them could be executed. In 1233 the lower orders of people, taking the law into their own hands, attacked and killed Conrad in the streets of Strasburg. When the Beghards appeared, 1367, Urban V. appointed two Dominicans inquisitors, who, countenanced by the emperor, Charles IV., renewed in Germany the cruelties practiced by their order in France. Afterwards the number of inquisitors was increased to six for the n. of Germany alone. As the reformatory influences increased, the general work of the inquisition was diminished, but in the latter part of the 15th c. a special zeal against sorcery and witchcraft was awakened, under the transient power of which many persons were put to death. In the 16th c. the reformation overthrew the tribunal, and all subsequent efforts to set it up again in Germany proved vain.

In ITALY the inquisition, partially introduced under the Dominicans in 1224, was

fully established by Gregory IX. in 1235. Its power was first directed chiefly against the Waldenses, who, having fled from the s. of France to Piedmont, were filling Italy with their doctrine. Afterwards it took in hand other heresies also; but it was greatly weakened by the schism in the papacy and by political agitations in the free states of Italy. About the middle of the 14th c., notwithstanding the opposition and the censures of Clement VI., measures were generally adopted to restrain its exorbitant power. The inquisitors were compelled to associate the bishops with them in examining accused persons; they were restricted to the cognizance of heresy alone, and the power of imprisonment, confiscation, fine, and corporal punishment was remanded to the secular arm. But such procedure having proved insufficient for suppressing free inquiry and maintaining the authority of the church, Paul III. instituted a supreme and universal inquisition at Rome, consisting of six cardinals, and having authority on both sides of the Alps to try all causes of heresy, with the power of arresting and imprisoning suspected persons and their abettors, of whatsoever estate, rank, or order. The grace of reconciliation and absolution the pope retained in his own hands. He assumed also the authority of the judge, and arrogated the power of life and death even over the subjects of the different governments of the world. These cardinal inquisitors soon made themselves feared in Italy and all countries over which they had influence. In Rome they executed their victims with less publicity but more frequency than the Spanish inquisitors. They were tyrannical also in their treatment of the press. Some books they destroyed, others they disfigured, and all printers they restrained from doing any work without a license from them. Opposition to them, however, everywhere arose. The republic of Venice, refusing to receive a tribunal responsible only to the pope, insisted that with his officers a certain number of Venetian magistrates and lawyers should always be joined, and that the final sentence concerning lay persons should be submitted to the senate before it was announced. The Neapolitans at the beginning of the 16th c. had twice resisted successfully the establishment of the inquisition among them. In 1546 the emperor, Charles V., renewed the attempt to introduce it into Naples, and according to the Spanish model. But the people, rising in arms against it, refused to receive anything more than a tribunal of limited powers similar to that of Venice. In Sicily, Spain supplied an inquisitor; and after the tribunal had been for a time abolished, it was restored in 1782, and was retained until 1808, when Napoleon, as king of Italy, abolished it. In Sardinia, having been restored by Gregory XVI. in 1833, it continued until the revolution of 1848. In Tuscany three commissioners, elected by the congregation at Rome, in concert with the local inquisitor, handed over their sentence to the duke, who was bound to execute it. In addition to this provision the "holy office" exerted its influence with the local authorities to send accused persons, especially ecclesiastics and strangers, to be tried at Rome. Since the abrogation of the pope's temporal power the tribunal still exists at Rome, but its public action is greatly restrained.

SPAIN. The inquisition was commenced, 1242, in Aragon, where the council of Tarragona gave instructions to the Dominicans. During the 13th and 14th centuries its power was directed fiercely against the Albigenses, who were numerous in that part of Spain. St. Ferdinand sometimes threw the fagots on the pile, and John II. hunted the heretics of Biscay as wild beasts among the mountains. By the middle of the 15th c., when the heresy of the Albigenses had been almost extirpated, new material for the inquisition was found among the Jews, many of whom, having professed conversion to Christianity, were suspected of being still unbelievers. After the union of Aragon and Castile the inquisition was reorganized in a more malignant form with the zealous approval of Ferdinand and the reluctant assent of Isabella. The first three general inquisitors, Torquemada, Desa, and Ximenes, made their names infamous by cruelties which, after all the deductions which can possibly be claimed, appear improbable and almost incredible, simply because of the multitude of the victims, and of the horrible sufferings to which they were doomed.

In PORTUGAL the efforts made to establish the inquisition failed almost entirely until after the union with Spain. It was then, under Spanish influence, introduced, yet not without difficulty, and only as a tribunal of the crown. The pope protested against this independent feature of it, but was compelled to tolerate what he could not prevent, and to be satisfied with a share in the proceedings and of the pecuniary gains. The highest tribunal was at Madrid, and the grand inquisitor was appointed by the king, subject nominally to approval by the pope. When Portugal became again an independent kingdom, John IV. endeavored to abolish the inquisition, but was prevented by the opposition of the Jesuits and priests. In the 18th c. Pedro II. succeeded in imposing restraints on the tribunal; in the next reign, the Jesuits having been expelled, its power was still further diminished; and under John VI. it was abolished, and the record of its proceedings burned.

Into the NETHERLANDS the inquisition was introduced in the 13th c., and exerted its authority severely. Under Spanish influence it was especially active during the reformation. In 1521 Charles V. published at Worms an edict against heretics, and appointed two inquisitors for the Netherlands, who, entering immediately on their work, were greatly aided by the regent, Margaret of Austria, and Granvella, bishop of Arras. Nevertheless, the reformation spread, and Charles, bent on destroying it, commanded the inquisition to be reorganized after the Spanish model. This command he after-

wards modified in consequence of the courageous representations of the new regent, Maria, queen of Hungary. Still the tribunal was very active, and great numbers of persons were condemned and put to death. Under Philip II. new cruelties were inflicted which, instead of extinguishing heresy, added new intenseness to popular fury. Several cities immediately united in demanding the abolition of the tribunal; others joined them, and in 1556 a league of the nobility was formed which, in loyal but earnest terms, renewed the request. This was for a time granted; but soon the duke of Alva was sent to the Netherlands with unrestricted powers; and cruelties, hitherto unknown, were inflicted on the suspected and the rich. In 1568, by a sentence of the "holy office" all the inhabitants of the Netherlands were condemned to death as heretics. "From this universal doom only a few persons, specially named, were excepted. A proclamation of the king, dated ten days later, confirmed this decree and ordered its instant execution. Three millions of people—men, women, and children—were sentenced to the scaffold in three lines" (Motley, *Rise of the Dutch Republic*, ii. 155.). Even this did not destroy the reformation; but after the provinces had been desolated and almost depopulated by emigration and death, their independence was secured, and the inquisition driven from the land.

In MEXICO, SOUTH AMERICA, and INDIA the inquisition was established by Portugal and Spain. Under John VII. of Portugal it was abolished in India and Brazil.

IN REM, a legal phrase designating an action against the thing, in contradistinction to proceedings *in personam*, or against the person. In admiralty practice such actions are common. They are brought for the enforcement of maritime liens against a vessel or cargo for the recovery of salvage, to procure the forfeiture of property, for a violation of the revenue laws, or to obtain possession of a prize in time of war. The action is solely against the property, taking no account of the owner or person in possession. The property, whatever it may be, is treated as if it were the defendant. If it be a vessel of that name, the title of the action will be "The United States *vs.* the ship *Parthian*." The same form of action is used to determine the legal status of a party before a court in respect to marriage, divorce, or other personal relations. Decrees in actions *in rem*, in whatever country they may have been made by a court of competent jurisdiction, are generally respected by the courts of other countries.

INSANITY means all unhealthiness of mind. This consists, according to one opinion, in such disorganization or degeneration of the nervous structure as to render the exercise of reason impossible; according to another, it consists in disorder of the reason itself; and according to a third, in perversion or destruction of the soul, or the moral part of our nature. The prevailing view of physiologists is, that insanity is a symptom or expression, manifested through the functions of the nervous system, of physical disease. The legal term, lunacy, represents only those deviations from that standard of mental soundness which is universally recognized, although difficult of definition, in which the person, the property, or the civil rights may be interfered with. These deviations are, briefly, where the incapacity, or violence, or irregularities of the individual are such as to threaten danger to himself or others, and to unfit him for his ordinary business and duties. Insanity is more comprehensive, and includes all states of the feelings and passions, as well as of the understanding, which are inconsistent with the original and ordinary character and habits of the individual, and with his relations to the family or community of which he is a member. It has been stated broadly, that if a man be deprived of the enjoyment of his religious rights by exclusion from membership of the church to which he belongs; of his civil rights in giving evidence in a court of justice or on oath; and of his personal rights in the management of his property and affairs, he may be regarded as insane; but more correct views of the human mind have led to the belief, that many degrees of feebleness of the faculties, many forms of eccentricity and extravagance, and many defects in the will and moral sentiments, which were formerly regarded as crime and wickedness, but which do not involve such deprivation, may be classed under the same designation. Very recently, the interpretation of insanity has been greatly widened, and now includes various degrees of moral perversion, morbid habits, and sudden impulses, such as dipsomania and homicidal mania. The great divisions of this class of diseases into mania, melancholia, and imbecility, remain popularly very much the same as they were 2,000 years ago. While this fact may indicate that such a classification has a foundation in nature, it has, unfortunately, tended to render the treatment, or rather the maltreatment, of the insane as stationary as the view of the diseases under which they labor. The following arrangement may serve to explain what insanity is, as well as what it appears to be.

AFFECTIONS OF THE INTELLECTUAL POWERS.—*Idiocy*, the non-development of one or more faculties. *Imbecility*, the imperfect development of one or more faculties. *Futuity*, or *dementia*, the deprivation by disease, or age, or otherwise, of powers which have been developed. *Mania*, with delusion, excitement, and irregular action of all, but especially of the intellectual powers; accompanied also by errors connected with the special senses.

AFFECTIONS OF THE SENTIMENTS.—*Melancholia*, exaltation of grief, penitence, and anxiety. *Monomania of fear*, exaltation of cautiousness. *Monomania of pride*, exaltation of self-esteem. *Monomania of superstition*, exaltation of the sense of devotion and

the marvelous. *Monomania of suspicion*, exaltation of jealousy, envy, want of confidence. *Monomania of vanity*, exaltation of craving for applause, grandeur, of feeling of ambition.

AFFECTIONS OF PROPENSITIES.—*Dipsomania*, uncontrollable craving for stimulants. *Homicidal mania*, impulsive desire to destroy life. *Kleptomania*, uncontrollable desire to acquire.

This catalogue is not intended to be exhaustive. The departures from health will correspond not merely with the primitive mental powers and instincts, but with every possible combination of these, and with such complications as may result from hereditary predispositions, innate peculiarities, education, and habit.—Dr. Combe *On Derangement*; Copland's *Dictionary*, art. "Insanity."

For the disposal and treatment of the insane, see LUNATIC ASYLUM.

INSANITY (*ante*), unsoundness of mind. Unhealthiness and unsoundness, according to general usage, are not synonymous terms when applied to the mind. A perfectly healthy mind requires a perfectly healthy body, and it also needs a certain healthy or normal training. The degree and also the quality of unhealthiness or unsoundness to constitute insanity must be such as to destroy a certain amount of the self-control of the individual, or to produce a degree of *perversion* of the intellectual or moral faculties. Modern alienists hold that such perversion is always connected with physical disease of some part of the nervous system. In most cases post-mortem examinations, as they are now made, reveal nervous lesions of some kind in all persons dying insane. Certain rules, useful, though sometimes empirical, for the diagnosis of insanity are adopted by physicians. Persons threatened with insanity are usually depressed in their manner, or are easily excited, the excitement being greatly out of proportion to the cause. A want of co-ordination of the faculties of the mind leads the subject to erroneous conclusions, and the formation, therefore, of false data; hallucinations appear, and the mind becomes completely unhinged. All forms of insanity have one important symptom in common, which is an impairment of the faculty of attention, arising, probably, from the loss of will. Delusions and hallucinations are, however, more certain symptoms, and clear ideas as to the definition of these terms are important. A delusion is more nearly connected with the mind; a hallucination is the result of an error in some sensory function. A man laboring under a delusion may believe that he is about to lose, or has lost, all his property when there is no foundation for such a belief, or that he is some other person, or that he is in possession of great riches. These delusions, therefore, may be of a gloomy or of a hopeful and exalted nature. A person laboring under a hallucination may imagine that he sees a spirit, or a person who does not exist, or different kinds of animals. In the temporary insanity of delirium tremens such hallucinations often occur. Hallucinations affecting the organs of taste and smell are common among the insane, and they are usually of an unpleasant character. Hallucinations of sight are common in those stages of insanity accompanied by exhaustion of the brain, when supernatural visions are likely to occur, and such patients often imagine that they hear voices commanding them to perform certain acts, often of a criminal nature, and of course they are then dangerous. Insane persons have a disposition to take off their clothes, sometimes probably from a feeling of oppression, sometimes with the idea of exposing the person. Insanity, especially that connected with epilepsy, often manifests itself in homicidal tendencies and acts. Although the qualities of insanity are infinitely various, as must be the result from the infinitely various parts of the nervous system which may be the cause of the aberrant phenomena, or the infinitely various ways in which those parts may be affected, still it is found convenient to classify the various forms into certain general groups, and the practice is not entirely empirical, but is connected with sound philosophy. The division of the older writers was mainly into mania, or violent insanity, and melancholy, with many subdivisions. There were then many fanciful distinctions because the researches of histological pathology had not connected physical phenomena with these causes. It was believed that physical disease was the chief cause, but what the nature of the ailment might be was not as well understood as now. Thomas Arnold, in 1802, made a classification into ideal, and notional, including over thirty varieties. Among certain sub-varieties, which he called pathetic, of which there were sixteen, were amorous, jealous, avaricious, misanthropic, suspicious, bashful, timid, sorrowful, etc. Pinel (q.v.), one of the original reformers in the treatment of the insane, made four principal divisions—mania, melancholy, dementia, and idiocy. Esquirol added monomania. Dr. Pritchard, in 1835, discriminated between moral and intellectual insanity, but many authorities do not recognize such a disease as moral insanity. That insanity is hereditary is now admitted by all alienists and physicians; also, that the inheritance is one of a physical nature, stamped deeply upon the typical structures of the organs of the body. Drunkenness is considered as one of the most powerful causes of insanity, and statistics support the opinion. The report of the commissioners of lunacy in England, in 1844, attribute 18 per cent of about 10,000 cases to the effect of alcohol. Dr. Benjamin Rush attributed the drinking of alcoholic liquors as the cause of more than one-third of the cases in America. Dr. W. B. Carpenter, of London, in his work on *Mental Physiology*, says that this indulgence weakens the *will* to that extent that control is lost over the emotions. Weakening

of the will is, indeed, one of the important features of insanity, and the powerful influence of the extreme use of opium and tobacco in this relation, as well as in weakening the memory, has been the personal experience of many. Dr. Maudsley believes that one of the most powerful causes of insanity is the eager pursuit of riches. He says: "In several instances in which the father has toiled upwards from poverty to vast wealth, with the aim and hope of founding a family, I have witnessed the results in a degeneracy, mental and physical, of his offspring, which has sometimes gone as far as extinction of the family in the third or fourth generation. When the evil is not so extreme as madness or ruinous vice, a mother's influence having been present, it may still be manifest in an instinctive cunning and duplicity, and an extreme selfishness of nature. I cannot but think, after what I have seen, that the extreme passion for getting rich, absorbing the whole energies of a life, does predispose to mental degeneration in the offspring—either to moral defect or to moral and intellectual deficiency, or to outbreaks of positive insanity under the conditions of life."

Institutions for the Insane.—The history of the care of the insane is full of interest. Among the ancients mental disease was less frequent than in modern times, but there were cases of insanity, and these were looked upon with a degree of awe, and the disease was often held to be sacred. In modern times, until the present century, less regard has been paid to the humane treatment of the insane than in any other period of history; although, during the dark and middle ages, the ignorance upon the subject, and the unsettled state of public affairs, must have led to great neglect or cruelty. But neglect to the unfortunate lunatic was much preferable to the care he received when imprisoned within the walls of a madhouse, and subject to the will of a keeper, who was often chosen more on account of his physical than his moral or intellectual qualities. In Europe one of the first measures in the reform of institutions for the insane was made by Pinel, who, in 1792, liberated fifty-three patients at the Bicêtre from chains in which they were bound. But he had been preceded in the same direction by Dr. Franklin, with others, as early as 1750, in the organization of the Pennsylvania hospital, in which a department for the care of the insane was established. A system of treatment was there adopted which was afterwards practiced by Pinel. In England, during the 16th, 17th, and part of the 18th centuries, considerable attention appears to have been given to insane asylums, and lunatics often received comparatively kind treatment; but for various causes, which seem ever to be the accompaniments of human institutions, the management became bad, and the society of Friends, in 1792, established an institution called the "Retreat," which was so successful that the attention of the government was finally called to the subject. A commission was appointed by the house of commons, whose investigations revealed a horrible state of affairs. It was brought out in the evidence before them that it was customary, when lunatics were taken to Dublin, to tie them to the back of a cart and force them to walk the whole distance. About one in five lost an arm from this treatment. It was found, in one house where there were 23 confined—14 men and 9 women—and where 7 of the women were supported at their own expense, that one room on the ground floor, 21 by 16 ft., and 7 ft. high, contained only six cells, 9 ft. long and 5 ft. wide, with a passage of 3 ft. between. There were no windows, and no means for ventilation; and the door opened opposite a pigsty and dung heap about 7 ft. distant. Three cells had board floors, the other three were on the bare ground. The bedsteads consisted of wooden boxes, 6 ft. long and $2\frac{1}{2}$ wide, to which the patient was chained. These unfortunates were taken into the open air once a week, when the straw was changed. The patients were so dirty that careful inspection was impossible. In regard to treatment, the physician at Bethlem said: "Twice a year, with a few exceptions, the patients are bled, and after that they take vomits once a week for a number of weeks, and after that we purge them. That has been the practice for years, long before my time."

The different forms of insanity are usually considered under the following divisions: 1. Melancholia; 2. Mania; 3. Dementia; 4. Imbecility; 5. Idiocy; 6. General Paralysis. Melancholy is usually preceded by hypocondria, and this is caused or accompanied with certain diseased conditions of the bodily organs, very frequently of the liver and digestive organs. The condition is often relieved by frequent administration of cathartics, combined with good diet, wine, iron, exercise, and recreation. When these remedies fail the patient will generally pass into a condition of mania. This is the case when the brain is the subject of degeneration through disease. This deprives the patient of the power of exercising the will; delusions and hallucinations supervene, and the condition becomes one of decided mania. Restraint often becomes necessary, but the tendency is to its abolition as much as possible, it being rarely practiced except in the acute stages. Mania may be acute or chronic. When there is hereditary taint it may be caused by grief or disappointment; but peculiar forms accompany epilepsy and general paralysis of the insane. The subject of mania exhibits the presence of the disease generally by great mischievousness or filthiness or obscenity, or by all of them. The bodily health of a maniac often does not seem to suffer, but frequently there is great constipation, and serious disturbances are taking place in the cerebral substance, as post-mortem examinations often reveal; but often they are not of a nature to cause death. The strangest of all forms of insanity is what is called general paralysis of the insane, an affection not to be confounded with ordinary paralysis. It has been only

within the present century that the disease has been recognized. M. Calmeil gave a description of it in 1826, and since that time it has been carefully studied. It has three stages: 1. The stage of incubation; 2. The acute maniacal stage; 3. The chronic maniacal stage. A fourth stage might be added, that of dementia, but it is as well regarded as the sequel to or a part of the chronic stage. The subject of this grave disorder generally shows, at the commencement of the attack, a strangeness of manner which is different from that of all other forms of insanity, and which is usually easily recognized by the experienced alienist. The subjects are nearly always males. A man is observed to depart suddenly from his ordinary habits; he seems to have lost his conscience; will make no apology for misconduct, of which he is constantly guilty. He fails to keep appointments, is often extremely immodest, and is easily roused to uncontrollable passion. As the disease advances he becomes sullen and more excitable, so that before long his friends are obliged to put him under restraint. He is prone to imagine himself a great personage, possessed of boundless power and riches, and boasts of performing the most wonderful feats of strength or agility, even after his disease has seriously impaired his bodily strength. In consequence of these peculiar delusions the French have called the disease *manie des grandeurs*. The speech becomes defective, accompanied by a peculiar stammer which is difficult to describe, but which is almost diagnostic to the experienced physician. Fits somewhat resembling those of epilepsy take place from time to time, but which are not at all amenable to treatment. A diagnostic distinction between these fits and those of true epilepsy is, that in the latter disease the patient usually bites his tongue, while the general paralytic does not as a rule. One important symptom is irregularity of the pupils of the eye. In 108 cases examined by Dr. Nasse, of Sieburg, irregularity was found in all but three; and Dr. Austin found the exceptions only two in 100. This, taken together with the other symptoms, is decisive. The average duration of the disease is about two years; sometimes it runs its course in a few weeks. Sometimes there is, for a short period, apparent recovery, and the patient may attempt to resume his occupation, but the attempt has always failed. The last stage, that of dementia, is truly pitiable; there is constant tremor, he loses his power to swallow, and will often cram food into his mouth until his cheeks are no longer capable of distension.

The insanity which accompanies epilepsy, known as epileptic insanity, has been studied with care, and many important conclusions have been reached. In this form the acts of the subjects are extremely sudden and independent of the will, and are of a strong homicidal tendency, and after the attack has passed away they are unable to remember anything that has transpired. The pathology of insanity is an exceedingly interesting study. There is often, in addition to evidences of cerebral and membranous congestion, thickening of the bones of the cranium, and adhesion and thickening of the dura mater. Blood cysts are often found in the arachnoid cavity, and there is great wasting of the cerebral substance, the brains of the insane weighing less than those of persons dying of other diseases.

The treatment of the insane is often difficult, requiring an intricate knowledge of various diseases, and great experience among insane patients; but the most important element of success, under all circumstances, may be embraced in one word—humanity. The wretch who neglects or maltreats the unfortunate subject of mental derangement intrusted to his care, if not himself insane and irresponsible, should be regarded with universal contempt.

According to the census of 1870—the latest official authority at present obtainable—the total number of insane persons in the United States (besides idiots, 24,477) was 37,382, in a population of 38,555,983. In England the total number of insane, including idiots, was, in 1870, 54,713, in a population of 22,090,000; in Scotland, 7,571, in a population of 3,222,837; and in Ireland, 17,194, not including idiots, in a population of 5,195,236. In France, in a population of 37,988,905, there were in 1866, of insane persons, 50,726. It may be estimated that the number of insane in Europe, in 1866, was about 270,000. The following table includes a list of the public and many of the private insane asylums in the United States, with the number of patients:

NAME OF INSTITUTION.	Locality.	Kind.	1873.	1875.	Date and Pat s.	Organ.

INSANITY BEFORE THE LAW. See LUNACY.

INSCRIPTIONS, a term applied to all writings engraved or written on objects or monuments not of the class of books, principally on hard materials, such as metals, stones, and other substances. They are a class of documents of the highest interest and importance to history and philology, and a consideration of them embraces the whole scope of history, language, and art. The oldest (excepting those of China) are probably the Egyptian inscriptions found in the pyramids (see PYRAMIDS), of about 2000 B.C.; to which succeed those of Assyria and Babylonia, reaching nearly as high an antiquity (see CUNEIFORM CHARACTERS); which are succeeded by the Persian and Median, 525 B.C., and along with which prevailed the Phenician, probably about 700 B.C. (see PHENICIA); which were in their turn succeeded by the Greek, between 500 and 600 B.C., or even earlier; which were succeeded by the Etruscan and Roman, in 400-300 B.C., and continued through the middle ages in Europe to the present day. See PALEOGRAPHY. In the east, the oldest inscriptions are those of China, which ascend to 2278 B.C.; those of India not being older than 315 B.C., or the age of Sandracottus; while the antiquity of the hieroglyphical inscriptions of Central America cannot be determined. Of many ancient nations, the history and language are found in inscriptions only, as in the case of Lycia and Etruria, and all official inscriptions have a certain authority, from their contemporaneous nature, and the care with which they were executed.

Before the invention of paper or other light substances for the record of events, public acts, devotions, and other documents were inscribed on *bronze*, as the early treaties and dedications of the Greeks, or even lead, as certain small rolls of imprecation and others found in Greece; gold plates were inscribed and placed in foundations under the temples, as that of Canopus show; the *exequaturs* of consuls among the Greeks, and the discharges of the Roman soldiery, were inscribed on bronze tables; while charms, amulets, and other formulae were occasionally inscribed on metals. The numerous inscriptions known, probably amounting to half a million, have been classed under public or official acts, tables of magistrates, military titles, lists of magistrates, those relating to the gymnasia or games, honors rendered to emperors or men, donations, rites, private and sepulchral, comprising epitaphs, some in elegiac and heroic verse, and numerous minor inscriptions on gems, vases, and other objects of ancient art, on wax tablets or *pugillaria*, and the scrawls discovered on the walls of public and private edifices, as at Pompeii and elsewhere. The study of the letters and their form will be seen under ALPHABET; that of the different languages and the mode of deciphering, under their respective heads. Those found upon coins will be mentioned in NUMISMATICS. The most remarkable inscriptions are the trilingual inscription of Rosetta, that of Shalmanazer on the obelisk of Nimrud, and the cylinder of Sennacherib; the trilingual inscription of Darius I. on the rock at Behistun; the Greek inscription of the soldiers of Psammetichus at Ibsamboul, and of the bronze helmet dedicated by Hiero I. to the Olympian Jupiter; the inscription on the coffin of the Cyprian king Asmumazer; the Etruscan inscription called the Eugubine tables; that of Mummius, the conqueror of Corinth, at Rome, and the will of Augustus at Ancyra; the inscription of the Ethiopian monarch Silco; the old monument of Yu, and the inscription of Se-gan-fu, recording the arrival of Christianity in China (631 A.D.); the inscriptions of Chandragupta and Asoka in India. The study of inscriptions is so difficult that it has formed a special branch of scholarship, such as decipherment for those of which the language has been lost, or epigraphy for the dead languages. Special collections of the inscriptions of different localities, and general ones, have been made of those in the same languages as Assyrian, Greek, Etruscan, Oscan, and Latin, by Gruter, Muratori, Böckh, Franz, Orellius, Mommsen, Letronne, Lebas, and others. Inscriptions have also engaged the scholarship and attention of the most accomplished philologists, with various success, from the end of the 17th century. They have been forged by Fourmont and others.—Gruter, *Thesaurus Inscr.* (fo. 1603-63); Muratori, *Novus Thesaurus* (4to, 1739); Kellerman, *Spec. Epigraph.* (1841); Monimsen, *Inscript. Neapol.* (fo. 1852); Böckh and Franz, *Corpus Inscript. Graec.*; Osann, *Sylloge* (1822); Lepsius, *Inscr. Umbr. et Ose.*; Gesenius, *Script. Ling. Phœn.*; Garucci, *Graffiti*.

INSECT FERTILIZATION. See FECUNDATION.

INSECTIV'ORA (Lat. insect-eating), in Cuvier's system of zoology, one of the divisions of the mammalian order *carnaria* (q.v.). None of the insectivora are of large size; most of them are small timid creatures, generally nocturnal in their habits, and useful in the economy of nature chiefly in preventing the undue increase of worm and insect tribes. Although many of them are not exclusively insectivorous, all of them have the summits of the molar teeth beset with small conical tubercles, as for the purpose of breaking up the hard coverings of insect prey. Their dentition is otherwise very different in the different families. Their legs are short. They all place the whole sole of the foot on the ground. The snout is generally elongated. The families of *talpidae* (moles, etc.), *soricidae* (shrews, etc.), *erinaceidae* (hedgehogs, etc.), and *tupaiidae* (banxrings) are referred to insectivora. The insectivora, although in some respects very different from the *cheiroptera*, exhibit an affinity to them in others.

INSECTIVOROUS BIRDS. Recent investigations, especially in the western states and territories, have brought more fully into notice the valuable qualities of certain

birds, as to their power of decreasing the multiplication of destructive insects. Although ornithologists have long given their advice and warnings, it has been the mistake of a considerable portion of the agricultural population of the country to believe that certain birds, which are called graminivorous, committed sufficient depredations to make them obnoxious, and therefore they have destroyed them. These fears may be well founded in a few instances, in regard to those predatory birds which destroy other and valuable birds, as the crow, the crow-blackbird, and the blue jay. Unfortunately these cunning birds are not the ones which have come in for the greatest share of condemnation. The blue-headed grackle, or Brewer's blackbird, a perfectly innocent little creature, and a friend of man, has been destroyed in the western country in countless numbers because it visited the cornfields in search of a kind of grub which lived upon the ears of corn. To get the grub the bird picked open the husks at the end of the ear, or through them at the sides. This did little damage to the ear, which the grub would have destroyed. But the farmer, fearful that the birds were carrying off his crop, soaked grain in strychnine, and strewing it upon the ground, caused the birds to die by the million. Prof. Samuel Aughey, of Lincoln, Neb., has furnished a list of locust-feeding birds for the first annual report of the U. S. entomological commission, which is extremely interesting and instructive, and from his chapter the notice of Brewer's blackbird above given is taken. It seems that this bird is purely insectivorous and does not live upon grain or seeds at all, unless it cannot get insects, grubs, or worms. Prof. Aughey states that the robin is not abundant in Nebraska, but is slowly increasing. A few were killed to ascertain the contents of their stomachs. Out of six, four of them had 51 to 59 locusts in their crops, and less than half that number of other insects. This was in the years 1865, 1875, and 1877, not great locust years, as 1874. A number of wood thrushes were bought from boys and their stomachs found filled with locusts (1865-75). The family of wrens were found particularly the friends of the farmer in their locust devouring habits. He mentions eight species, the long-billed marsh wren being perhaps the greatest feeder. The parents in one nest were seen to bring 31 locusts from dry bluffs about a mile distant in the space of an hour. The short-billed marsh wren was not detected in locust carrying, but is believed to be a locust feeder. The house wren feeds upon quantities of small locusts, but was never seen to capture a full grown insect. The family *sylviolidae*, or American warblers, of the same order (*insectivores*), of which prof. Aughey mentions some 30 different species belonging to different genera, are nearly all great locust eaters. The golden warbler was a curious exception, as its stomach contained only half as many locusts as of other insects, while the converse was the rule with other species. The swallows and sparrows were found to be great locust eaters. The cliff-swallow, or cave-swallow, is perhaps the principal insect destroyer, on account of its numbers. It breeds on the sides of cliffs and under the eaves of buildings. U. S. geologist Hayden has observed great numbers of these birds along the Missouri river, especially along the chalk bluffs near Niobrara, and prof. Aughey also observed them in the same locality in 1877. Three miles e. of the town on the sides of a perpendicular chalk rock he counted 2,100 nests of the cliff-swallow. They eat countless numbers of locusts. Of the family *ampelidae*, or *bombycillidae*, or wax-wing family, the "brotherly love" vireo, a common bird in eastern Nebraska, eats vast numbers of locusts and other insects, and the warbling vireo, abundant in n.w. Nebraska, is quite as great a locust and other insect feeder. The shrike family (*laniidae*), particularly the white-rumped shrike, which are quite abundant in Nebraska, are great locust eaters, but in their stomachs were also found portions of other insectivorous birds. They are, therefore, not to be highly commended. Among the American starlings, the bobolink, reed-bird, or rice-bird, is very abundant in Nebraska, where it breeds. It is popularly supposed to be exclusively graminivorous, but prof. Aughey discovered that on occasions it was highly insectivorous, as their stomachs, whenever examined, were found to contain, along with seeds, many locusts. The king bird, or bee martin, as well as many other "flycatchers," of which 10 or more species are mentioned, are, of course, highly insectivorous, but where locusts abound these insects are their favorite food, the phoebe bird particularly being a locust-gormand. The cuckoos, which are shot and sold by the butchers, were often found to have over 45 locusts in their stomachs, none less than 37. The golden-winged woodpecker, or flicker, was often found with no seeds in its stomach. Eight flickers were bought from a sportsman who had shot them in a wood in Dixon county, and their stomachs were filled with locusts and other insects. Two of them had eight grains, four of them from two to six grains, and two of them had none, in their stomachs. This beautiful bird, the robin, and even the merry bobolink, are hunted and shot, even in our eastern states, where they are not near plentiful enough, by unthinking men, and they ought to be protected. Mr. Cyrus Thomas, one of the members of the entomological commission for examining into the subject of the Rocky mountain locust, in chap. xii. of the report above mentioned, on "the usefulness of birds," maintains that, with very few exceptions, the whole class of birds are the friends of man. We know that many of them are his companions, and certainly more would be if he did not lay his destructive hands upon them. See BIRDS and ORNITHOLOGY.

INSECTIVOROUS PLANTS. See DIONÆA.

INSECTS, *Insecta*, one of the classes of *articulata* (q.v.), or articulated animals, of the division having articulated members. All the *articulata* having articulated members were included by Linnæus in the class of insects; but the *crustacea* and *arachnida* were soon separated from it, and afterwards the *myriapoda*. See these heads. This restricted application of the term insect corresponds more nearly with its popular use, and so well accords with its derivation, that it may be regarded as one of the most appropriate names employed in natural history. It is from a Latin word, signifying *cut into*; a derivation exactly answering to that of the Greek *entoma*, from which the science having insects for its subject receives the name of entomology. Insects, a natural and extremely well defined class of organized beings, are remarkable, in their mature or *perfect* state, for the division of their bodies into three very distinct portions—the *head*, *thorax*, and *abdomen*; the divisions being often so deep, that the slenderness to which the body is there reduced cannot be contemplated without admiration.

The body of an insect, as of all the other *articulata*, is composed of a certain number of rings. One of these forms the head; or, if the head ought to be regarded as really composed of several rings, modified and condensed together, as the skull of vertebrate animals is formed of modified vertebrae, yet no distinction of rings appears. The eyes, the antennæ, and the organs of the mouth, are the most conspicuous organs connected with the head.

The thorax is formed of three rings, closely combined, but easily distinguishable. The first is the *prothorax*; the second, the *mesothorax*; the third, the *metathorax* (Gr. *pro*, before; *mesos*, middle; and *meta*, after). Of these rings, one or another is often remarkably developed. The legs and wings are attached to the thorax. Insects have six legs, and generally four or two wings, never any other number; but some are wingless, and this is the case not only in all the insects of certain groups, but also in particular species of groups ordinarily winged, and is sometimes even a distinction of sex, as in the glow-worm. The first pair of legs are attached to the prothorax; the second, to the mesothorax; and the third, to the metathorax. The first pair of wings are attached to the mesothorax; the second, to the metathorax. In dipterous (two-winged) insects, the place of the second pair of wings is occupied by two small organs—little threads, terminated by a knob—called balancers (*halteres*), the use of which is not well known.

The abdomen consists of nine rings, or of fewer; as some are often obliterated, or modified, to form various appendages. It contains the principal viscera. In it, the sexual organs are situated. The rings of the abdomen are much more separate and movable than those of the thorax. The terminal rings of the females of some groups form an oviduct or ovipositor, which is sometimes capable of being employed as a borer, to make a place for the eggs in the animal or vegetable organism destined to receive them, and which in wasps and bees is replaced by a sting.

The nervous system of insects, in all their stages of existence, exhibits the general characters noticed as belonging to the *articulata* (q.v.). There is a *brain*, or ganglion of the head, from which arise the nerves of the eyes, antennæ, and mouth.

The rings of which the body of an insect is composed appear most distinctly in the external covering. This is in most parts hard, but more or less flexible, of a horn-like substance, chiefly composed of *chitin* (q.v.). The external covering of insects is the principal framework of their bodies, and to it the muscles are attached. The external covering of each ring is more or less distinctly divided into two parts—a dorsal and a ventral—the connection at the sides being effected by a softer and more flexible membrane, a still softer membrane connecting the rings of the abdomen, so as to allow considerable freedom of motion; whilst between the rings are minute pores called *stigmata* or *spiracles*, by which air is admitted to the *tracheæ* or air-tubes (q.v.), the organs of respiration.

Insects respire neither by means of lungs nor of gills, and the blood is not brought to a particular part of the body for aeration, as by circulation in vertebrate and many invertebrate animals, but the air which enters by the breathing-pores is conveyed by tubes to all parts of the body, and even through the delicate structure of the wings, so that the whole frame is rendered more light by the very means employed to maintain and increase muscular energy. Respiration is extremely active in insects; they consume a great quantity of oxygen in proportion to their size, and they display, in general, an extraordinary degree of activity and muscular energy. The flight of very many kinds is far more rapid in proportion to their size than that of birds; others display a similar superiority of powers in running, swimming, or digging and burrowing; whilst the leaping of many, as fleas and grasshoppers, and the springing of others, as cheesehoppers, prodigiously exceeds anything of which any vertebrate animal is capable. The respiration of aquatic insects takes place in the same manner as that of other insects, and they come to the surface of the water for fresh supplies of air.

The blood of insects is thin and colorless. It is not everywhere inclosed in vessels, but is freely diffused in interstices between the muscles and other organs, and in the visceral cavity. It contains globules or corpuscles of determinate shape. How far the *dorsal vessel* (see ARTICULATA) should be regarded as a *heart*, is not fully determined; but by its contractions and dilatations, a constant motion of the blood is maintained.

The members of insects have generally a structure analogous to that of the trunk, in being composed of articulations, the hard and solid part of which is the external cover-

ing. This appears very perfectly in the legs, the antennæ, and the palpi, but not in the wings.

The legs of insects consist of two principal parts, the thigh (*femur*) and shank (*tibia*), with two smaller articulations, the *coxa* and *trochanter*, interposed between the body and the thigh, and at the extremity of the shank, a set of three, four, or five small articulations, called the *tarsus*. The last segment of the tarsus in terrestrial insects is generally terminated by a pair of hooks or little claws; and many dipterous insects, as the housefly (q.v.), have disks and suckers for taking hold of smooth surfaces.

The wings of insects are often very large in proportion to the size of the body, and the rings of the thorax are soldered together, and supported by supplementary pieces, to give firm support to them, and to the powerful muscles necessary for their action. The hard covering of the body of an insect consists, like the skin of vertebrate animals, of three layers, and the membranes of the wings are filmy expansions of the outermost of these, the epidermis. The ribs or nervures in the wings of insects are tubes, of which one of the uses is the conveying of air even to the extremities of the wings. The forms of the wings are very various; some of the more important diversities being characteristic of different orders. The bodies of insects are often very much covered with hairs, which are often very long and thick in proportion to the size of the animal, and on the wings of butterflies and other *lepidoptera* are flattened and expanded so as to form scales (see BUTTERFLY) often richly colored, and also, by reason of very fine parallel striae, with which they are marked, displaying an admirable iridescence or reflection of evanescent prismatic colors in changing light. The first pair of wings in coleopterous insects or beetles is represented by a pair of hard chitinous *elytra* (Gr. coverings), or wing-covers. *Orthopterous* insects have softer leathery or parchment-like *elytra*.

Insects feed on very different kinds of food; some prey on other insects, some devour animal, and some vegetable substances, some suck the juices of animals, some the juices of plants or the honey of their flowers. The structure of the mouth varies accordingly, and the digestive organs also vary. The mouth is either adapted for gnawing, cutting, and tearing, or merely for sucking, or it is adapted partially for both of these purposes. The parts of a mandibulate mouth are an upper lip (*labrum*) and an under lip (*labium*), moving vertically; and an upper pair of jaws or mandibles (*mandibulae*) and a lower pair of jaws (*maxillæ*), moving horizontally. The upper and under lip meet when the mouth is shut. Both are as hard as the jaws. The lower lip is sometimes regarded as consisting of two parts, called the chin (*mentum*), and the tongue (*lingua*), which is more membranous and fleshy, and reposes on the inside of the chin. The upper jaws or mandibles are usually powerful, and often strongly toothed and hooked, sometimes furnished with cutting edges like sharp scissors, and sometimes adapted for bruising and grinding. They are also the instruments which bees and other insects use for their wonderful operations of cutting, tearing, building, plastering, etc. The lower jaws or maxillæ are generally less powerful. In some insects, in which the mandibles are enlarged into great organs of prehension, the maxillæ alone serve for the ordinary use of jaws in eating. To the maxillæ and the lower lip are attached organs called *palpi* or feelers, consisting of a number of minute articulations, supposed to be delicate organs of touch connected with the purposes of the mouth, and distinguished as *maxillary palpi* and *labial palpi*.

The mouths of mandibulate insects are sometimes called *perfect*, and those which exhibit a different character, *imperfect*. The terms, however, are improper—each kind is perfect, according to the purposes for which it is to be used. Yet a correspondence of structure may be traced, so that the parts of the mandibulate mouth may be recognized under various and very remarkable modifications in the mouths of insects which live by suction. Thus the filaments which form the proboscis of butterflies are the maxillæ excessively lengthened, and the cutting parts of the mouth of the flea are the mandibles and maxillæ. The proboscis of flies represents the lower lip.

The alimentary canal of insects is usually more or less convoluted. Between the mouth and the proper digestive stomach, it sometimes exhibits a *crop* (honey-bag of bees) in insects which live by suction, and this is either a dilatation of the lower part of the gullet or a lateral vesicle; sometimes a *gizzard*, with muscular walls, often armed with horny pieces, for trituration of food. The stomach is of a very elongated form. The liver is represented by long slender bile-tubes, four or more in number, which wind around the intestine, and pour their secretion into it, where it originates from the stomach. The salivary glands are generally similar tubes.

The eyes of insects are of two kinds—*simple* or *stemmatic*, and *compound* or *composite*. See EYE. Some insects have only simple eyes (*ocelli*), some have only compound eyes; but the greater number have two large compound eyes on the sides of the head, and three small simple eyes between them. Compound eyes occur in insects only in their mature or perfect state; the eyes of larvæ are simple.

The antennæ (q.v.) are generally regarded as organs of touch. They are attached to the head in front of the eyes, and are always present, and always two in number. They exhibit a vast variety of different forms. Insects make much use of their antennæ to investigate surrounding objects by contact, although, if this is their sole use, it is not very easy to assign any probable reason for some of their forms; but there is not much plausibility in the conjectures which assign to them a part in the exercise of the senses of hearing and smell, although these senses and taste are evidently enjoyed by insects,

or at least by many insects in great perfection, and their particular seat and organs are not well ascertained. The sense of smell appears to be of great importance to insects in guiding them to their food. The sexes are distinct in all insects, and very remarkable differences are often exhibited by the males and females of the same species, in size, color, and the form and structure of parts that have no immediate connection with the reproductive system. What are called *neuters* in some tribes are imperfectly developed females. The connection of the sexes takes place only once in the lives of insects, and a remarkable provision is made in the female for the consequent fertilization of eggs that in some—as bees—continue for a long time afterwards to be successively developed.

Insects are generally oviparous; a few are ovoviparous. The *aphides* afford an instance of what has been called the alternation of generations. The greater number of insects take no care of their eggs after depositing them, and many themselves pass out of existence before the eggs are hatched; the chief part of the lives of insects being generally spent in their immature states, and their brief existence in a perfect state serving mainly for the propagation of their species. Thus many insect tribes disappear entirely on the approach of winter, their eggs awaiting the warmth of spring or summer to be hatched. The case is very different, however, with bees, ants, earwigs, and some others, which carefully tend and rear their young.—The number of eggs laid by insects is very various, but often very great. The flea, indeed, only lays about 12, and many dipterous and coleopterous insects about 50; but the silkworm produces from 500 to 2,000; a single queen bee is supposed to lay 40,000 or 50,000 in a season; and the female termite or white ant, laying about 60 eggs in a minute and for a period of very considerable though unknown duration, exceeds as to the number of her eggs any other known animal in the world.

The eggs of insects are generally white, yellow, or green; they are of very various shapes—round, cylindrical, conical, lenticular, etc.; they are sometimes smooth, sometimes beautifully sculptured.

The stage of development at which insects come forth from the egg is very different in different tribes: in some they appear as footless worms; in others they have rudimentary feet, but still with very little power of locomotion; in others, besides little claws representing the six feet of the perfect insect, there are on the abdominal segments of the worm-like body fleshy tubercles serving as feet; in others still, the legs are well developed, and the insect on issuing from the egg differs little from the perfect insect, except in the want of wings; whilst, finally, in a comparatively small number (lice, etc.), there is no obvious difference except in size. Similar differences of the degree of development appear in the mouth, eyes, and other organs. Hence the subsequent changes by which the mature state is reached are very different in degree; and insects being primarily divided into those which undergo and those which do not undergo metamorphosis, some of the former are commonly spoken of as undergoing *complete* and others *incomplete* metamorphosis. In the first state of insect life the insect is called a *larva* (q.v.). Grubs, caterpillars, and maggots are the larvæ of different orders of insects. From this state it passes into that of a *pupa* (q.v.), or nymph—a *chrysalis* or *aurelia* is the *pupa* of a lepidopterous insect—and finally it becomes an *imago*, or perfect insect.

The metamorphoses or transformations of insects have always been regarded with great admiration. A worm inhabiting a muddy pool becomes a winged creature that sports in the air. A crawling caterpillar that ravenously devours some kind of herbage with its horny jaws, eating vastly more in proportion to its size than an ox, is converted into a splendid butterfly, flitting from flower to flower and feeding only on nectareous juices. The intermediate or pupa state only adds to the wonder. The caterpillar, after several *moltings*, or changes of skin, and when it has attained its utmost size, ceases from eating, perhaps fixes itself under a leaf, becomes incased in a horny covering, as in a second egg, and from this it finally breaks forth a moth or a butterfly. Many larvæ also, when about to change into the pupa state, spin cocoons (q.v.) in which they envelop themselves by means of *spinnerets* on the under-lip, through which a viscid secretion passes in fine threads which harden into silk. But whilst the pupæ of many insects are motionless, or nearly so, and eat no food whatever, the pupæ of other insects, as dragonflies, are active and voracious. The intermediate or pupa state often differs little from the larva state, except in the possession of wings, or from the perfect state, except in the wings being merely rudimentary and still unfit for flight.

An opinion at one time prevailed that the successive envelopes of the larva were all contained from the beginning within the first, within them the covering of the pupa, and within it the perfect insect. This extraordinary fancy has given place to the belief, established on sufficient observation, that the envelopes which the growing larva successively casts off are merely a hard, thick, extravascular, and unextensible epidermis; that the jaws, claws, etc., of the larva, with which it parts when it becomes a pupa, in the case of insects undergoing complete metamorphosis are connected with the epidermis; and that the covering of the pupa is a new secretion. Discoveries, however, do not render less marvelous, but only more admirable, the changes which take place. Of these, some of the most important are in the organs of the mouth, the digestive organs, and the nervous system.

It is not certain that any insect has a voice or cry, although the origin of the sounds produced by some of them, as the plaintive, squeaking note of the death's-head moth, is

not known. The sounds of which we do know the origin are not produced by the mouth or throat. See GRASSHOPPER, DEATH-WATCH, and CICADA.—The *humming* or *buzzing* of insects during flight has been commonly ascribed to the extremely rapid vibrations of their wings. Burmeister, however, supposes it to be produced by vibratory laminae in the respiratory spiracles of the thorax, acted upon by the forcible emission of air during the violent muscular action necessary for flight.

Insects are all animals of small size, and many of them are minute. The largest species are tropical, and insects of all sizes abound in warm far more than in cold climates. The insects of the polar regions are comparatively few, and are to be seen only during summer; those of them whose whole existence is not comprised within a single year spending the winter, as very many insects of temperate climates also do, in a state of torpidity. All insects are very fond of heat, and many which do not become completely torpid in cold weather become partially so. It is only in warm weather that insects display their greatest activity. As to their geographical distribution, insects are found in all countries, to the utmost alpine and polar limits of vegetable life. Many kinds are peculiar to particular climates and countries. The insects of the Malayan archipelago and of Australia, like their other natural productions, are generally very different from those of other parts of the world. The insects of elevated mountainous regions within the tropics generally resemble those of the temperate and frigid zones, but are seldom the same. The multitude of species of insects is very great. The species of coleopterous insects alone, or beetles, are more numerous than all those of vertebrated animals together.

A few insects are important for their usefulness to man, and a greater number for the injuries which they inflict. Of the former, bees and silkworms deserve to be first named; and after them the cochineal insect and cantharides or blistering-flies. There are a few others to which we are indebted for substances useful in medicine and the arts, as kermes, lac, galls, etc. Of the injuries inflicted by insects, the most serious are those caused by the destruction of herbage and crops, as by the ravages of locusts, of some kinds of caterpillars, and of numerous tribes of coleopterous and dipterous insects. See CORN-FLY, TURNIP-FLY, etc.

The primary division of insects into those which do not undergo metamorphosis (*ametabolia* and *metabolia* of Leach), has been already noticed. The former are divided into the orders *thysanura* (q.v.) and *parasita* (q.v.) or *anoplura*, and are all included in the order *aptera* (see APTEROUS INSECTS) or wingless insects of Linnaeus. The insects undergoing metamorphosis, which are far more numerous, are divided into two great groups, *mandibulata* and *haustellata*, the former having the mouth fitted for mastication, the latter for suction. The *mandibulata* form the universally recognized orders *coleoptera*, *orthoptera*, including *dermoptera* of some entomologists, *neuroptera*, and *hymenoptera*; the *haustellata* form the orders *hemiptera*, including *homoptera* of some, *lepidoptera*, *strepsiptera*, *diptera*, and *suctoria* (*aphaniptera* of some). See these heads.

Fossil Insects.—Several causes conspire to make the remains of insects in the stratified rocks comparatively rare, such as their possession of the power of flight, their soft and speedily decomposing bodies, and the extent to which they are preyed upon by other animals. That they were abundant during some periods is, however, very evident. In the lower lias several bands of limestone occur, which, from the abundance of insect remains contained in them, have been called “insect limestone.” They are crowded with the wing-cases of several genera of coleoptera, and insects almost entire are frequently found. The strongly nerved wings of some neuroptera are beautifully perfect. In the eocene strata at Auvergne, a considerable thickness of limestone is formed entirely of the inclusa or cases of the aquatic larva of a neuropterous insect. Amber from tertiary strata often abounds in insects captured and inclosed while this petrified gum was in its primitive fluid condition, and now made permanent in the transparent stone, with every minute detail of structure beautifully preserved.

The oldest strata in which insects remain have been observed belong to the carboniferous period. The remains consist of fragments of neuroptera, orthoptera, and coleoptera.

The lower lias insects belong to various orders; they are generally of a small size, apparently indicating a temperate climate. In the upper lias they are not infrequent; a few specimens have been found in the oolite proper; and in the wealden both land and water forms occur. None have been noticed as yet in the deep-sea rocks of the cretaceous period, but in the newer tertiary strata they are common, especially in the amber from the lignite beds of Germany and in the cavern deposits. It is worthy of remark that no new forms have been observed; all are either referred to living genera or placed in new yet nearly allied genera.

INSESSORES (Lat. *perchers*), or PERCHING BIRDS, an order of birds called *passerine* (sparrow-like) *birds* by Cuvier. In respect of the number of species which it contains, it is by far the largest order of the whole class of birds. Cuvier says: “Its character seems at first sight purely negative, for it embraces all those birds which are neither swimmers, waders, climbers, rapacious, nor gallinaceous. Nevertheless, by comparing them, a very great mutual resemblance of structure becomes perceptible.” A principle

characteristic is found in the structure of the feet, which are particularly adapted for perching on the branches of trees, and have three toes before and one behind, the hind toe on the same level with the others. The legs are neither very long nor very strong; nor are the claws in general very long or very sharp. The wings are often long, and the power of flight very considerable, but this is not always the case. The neck is not long. The bill exhibits many varieties in length, thickness, etc., being very short and thick in some, very slender in others, but never exhibits the characteristic peculiarities of the accipitrine beak, although there is an approach to them in the shrikes, which are a connecting link between the two orders. The insessores with short strong beaks are principally granivorous, those with slender beaks insectivorous; but very many adapt themselves almost indifferently to both kinds of food. Some feed on pulpy fruits; some on vegetable juices; some chiefly on carrion. The stomach is a muscular gizzard. To the order insessores belongs the singing birds, and throughout the whole order a variously complicated structure of the lower larynx prevails. The insessores pair, but the attachment of the sexes in most of them seems to endure only for a single season. They generally build interwoven nests, and lay numerous eggs. The young are always naked and blind on coming forth from the egg.—The insessores are divided into four great tribes or sections, *dentirostref*, *conirostres*, *tenuirostres*, and *fissirostres*. See these heads.

INSOLVENCY, or **BANKRUPTCY**, is the state of a person declared to be unable to pay his debts. Insolvency is a term which in England had long been confined to the case of a non-trader who was unable to pay his debts. All who were *traders* (a term which was not always easily defined) were said, in the same circumstances, to be, not insolvent, but bankrupt. Different courts, called the bankrupt and insolvent courts, were applicable respectively to these two great divisions of mankind, traders and non-traders, and the chief points of difference in the procedure were these. In the case of traders, the court of bankruptcy was the court to which they or their creditors applied for its summary intervention. That court, whenever a man who was a trader was unable to pay his debts—certain tests of which inability, called acts of bankruptcy, were assumed as infallible symptoms—on the application of a creditor, took forcible possession of his property or his assets of every kind and denomination, converted these into money, and distributed the produce impartially among the creditors, according to certain rules, at the joint expense of the creditors. In the course of doing this, the court required the bankrupt to state all the property he had, where it was, and to give explanations as to what had been lately lost; and it was a crime for him to conceal or make away with any part of his property to the prejudice of this impartial distribution. The creditors also came in and proved their debts against his estate, thereby showing their title to share in it. In this way the debtor was entirely stripped of everything (with a few trifling exceptions) which he had, and which was salable; and, on the other hand, he received a certificate which entirely cleared him of the incumbrance of his past debts for ever—freed him not only from imprisonment, but even from the liability to pay more in future, should he afterwards become rich; and he could thus begin the world anew.

On the other hand, the non-traders, who consisted of country gentlemen, professional men, gentlemen at large, and nondescripts of every degree who were not traders, fell under the care of the insolvent court. These non-traders petitioned the court voluntarily, instead of their creditors doing so, as was the case in the bankrupt court, and they of course put off this application till the last, when they were in prison, though they might also petition before any creditor put them in prison. The sole condition on which the insolvent court granted them its protection, and discharged them from prison, was, that they should not only give up all their property, but state fully all the debts and liabilities they had incurred. If they did this satisfactorily, the court relieved them from imprisonment, which was the most obnoxious of their terrors, but did not entirely free them from the debt they had incurred. On the contrary, they were still liable for their debts; and if ever they should in future become rich enough to pay twenty shillings in the pound, they were still held liable to make up that amount. This contingency, however, seldom happened, and, moreover, when it did happen, considerable leniency was shown to the debtor, so that practically, both in bankruptcy and insolvency, the debtor was more or less whitewashed, and was at least saved from imprisonment.

Important changes were made in the practice of bankruptcy by the act of 1869, 33 and 34 Vict. c. 71, which repealed the prior enactments and rendered the law more uniform. Under that act non-traders as well as traders may be made bankrupts; and even peers of the realm not only may be made bankrupt, but, on being declared so, are at once disqualified from sitting and voting in the house of lords till they have received their discharge. The act 34 and 35 Vict. c. 50, provided that the moment a peer is adjudged a bankrupt his disqualification begins, and he commits a breach of privilege if he sits or votes, or attempts to do so, while thus disqualified. And if he is a representative peer, a new election must take place when he becomes bankrupt.

The bankruptcy laws date from the time of Henry VIII., and the insolvenoy laws from the time of Elizabeth, the distinction as above explained having always been kept up between them till the old statute, 24 and 25 Vict. c. 184, passed in 1861. By that

statute, the insolvent court was abolished. The court now administering this branch of the law is called the court of bankruptcy, which, as far as the London district is concerned, sits in Basinghall street, city. The London district includes all the area of the ten metropolitan county courts. The rest of England is divided into separate jurisdictions, and the judge of each county court is the ordinary judge. In London, the chief judge in bankruptcy, who is also one of the judges of the chancery division of the high court, sits, and has several registrars under him, to whom he has power to delegate his jurisdiction. Each judge of county courts has also all the jurisdiction of a judge in chancery; and each county court is a branch of the bankruptcy court. There is an appeal from a local court to the chief judge, and then to the high court of appeal. The office of official assignees is abolished, and the creditors choose a trustee to represent their interests and administer the estate, and collect and distribute the effects. The registrar of each county court is an official trustee, but he merely acts till the creditor's trustee is appointed. The comptroller, whose office is in London, keeps a register of all bankruptcies, showing the state and progress of each; and the high bailiff serves all summonses, and inserts advertisements in the *Gazette*.

The tests of bankruptcy, or rather the acts done by a trader which make him liable to be proceeded against as a bankrupt, are technically called acts of bankruptcy. These are; departing the realm—remaining abroad—absenting himself from his dwelling-house—keeping (himself prisoner in his) house—suffering himself to be outlawed and sued by creditors for debt—or allowing his goods to be taken in execution for debt—executing a fraudulent grant, gift, or conveyance of his lands or goods. If a trader execute a conveyance of his whole property to a trustee for the benefit of his creditors, this will be treated as an act of bankruptcy, if any creditor petition within six months thereafter to make him a bankrupt. And, after a petition has been presented, the paying or giving security to any one creditor, so that he shall receive more than the other creditors, is void and null. If any creditor make an affidavit of debt, and give notice to the trader requiring immediate payment, the court of bankruptcy may order this to be filed, and call on the trader, if he do not *bond fide* dispute the debt, to enter into a bond with sureties to pay it in a given time, and refusal or neglect to attend or to pay this is an act of bankruptcy. With regard to a non-trader, the acts of bankruptcy were these: if, with intent to defeat or delay his creditors, he depart the realm, or remain abroad, or make a fraudulent gift, conveyance, or transfer of his real or personal estate; but in these cases the court did not declare him bankrupt until it was shown he had, whether abroad or not, been personally served with notice of the intended application, or at least that every reasonable effort had been made to effect such personal service; that is to say, to put into his hands written notice and full information of what is intended against him. Other acts of bankruptcy, which were applicable to both trader and non-trader alike, were the lying in prison for debt—suffering his goods to be taken for debt—filing a declaration in the court of bankruptcy that he is unable to meet his engagements, provided a petition for adjudication of bankruptcy be filed against him within two months thereafter. The acts of bankruptcy, in all cases, are now the same, and are as at first stated, one being also the filing of a declaration of inability to pay his debts.

The mode in which an adjudication in bankruptcy is conducted in England is as follows: The act of bankruptcy, as already explained, must have occurred within six months before the proceeding is commenced. The first step is a petition to the court. This may be presented either by one or several creditors. If, as is most usual, it is presented by a creditor, then such creditor must have a claim of debt amounting to not less than £50; or if the debt of two creditors amount to £50, they may jointly petition; or if the debt of three creditors amount to £50, they may jointly petition. Such debts may be due under mortgages, securities, or liens, and the costs and interest previously due in respect of such debts count as part of the whole debt. If a person in prison for debt is too poor to pay the fees, he formerly could be allowed to present the petition against himself *in forma pauperis*; and as a monthly return of all debtors must be forwarded to the bankruptcy court, if prisoners stayed beyond a limited time—viz., if traders beyond a fortnight, and if non-traders beyond two months—without voluntarily petitioning, the court would at once make them bankrupts. But, imprisonment being abolished, creditors now begin the process. On the petition for adjudication of bankruptcy being presented, together with an affidavit of the debt, it is filed in court, and on proof of the particular act of bankruptcy, the court adjudicates the debtor a bankrupt. The court then appoints the official registrar to take possession of the property and premises. Before the adjudication is advertised in the *Gazette*, the debtor is to have notice personally, or by service, at his premises, and a certain number of days, from seven to fourteen, are allowed to him to show cause why the adjudication should not be deemed valid. The bankrupt is then to deliver up all his books and papers on oath to the official registrar. He is bound to give information to the official registrar and the court, and to attend from time to time for that purpose, and he is allowed remuneration for that purpose. A small sum is also allowed for his and his family's maintenance during the proceedings. In general, the bankrupt from this time to the end of the proceedings is free from being arrested by individual creditors, and receives a protection from the court. The petitioning creditor, at his own costs, prosecutes the petition up to the stage when the creditors choose their trustee, when these costs are repaid to him.

Soon after adjudication of bankruptcy, a ten days' notice is given in the *Gazette* to the creditors to meet and appoint a trustee. On this occasion, the creditors must first prove their debts, which they do by their affidavit or oath, together with production of any security or document verifying the debt. All creditors having thus proved their respective debts, have power to choose one or more persons as creditors' trustees; but the court has power to reject for want of security. The creditors may be represented on such occasion by an agent or deputy, whose authority needs no stamp. Creditors may determine whether such trustees shall give security. The court declares the appointment final. From the moment of their appointment, the whole of the bankrupt's real and personal property of every kind vests in them. They can sell it, and in general do every thing which the bankrupt himself could have done. They are accountable to the creditors, and must render frequent accounts, and give explanations, which accounts must be printed and sent to every creditor. They manage and realize the estate and collect the debts, and can compromise claims and sue if needful. The court can summon the bankrupt, his wife, and all persons for examination. A sitting is appointed for every examination of the bankrupt which the court or the trustees may deem necessary. Meanwhile all creditors who have debts must complete the proof. Every creditor may prove his debt by delivering or sending through the general post, to the official registrar—or, if the creditors' trustee has been appointed, then to the latter—a statement of such debt, and of the account of any, and a declaration signed by such creditor appended thereto that such statement is a full, true, and complete statement of account, and that the debt is justly due. If the debt is undefined, and consists of unliquidated damages, then the court orders a jury to be impaneled, either before itself or a court of law, to fix the sum. Debts which have been incurred, but are payable at a future time, may also be proved, and so may contingent debts and liabilities. When wages are due to clerks and servants at the time of the bankruptcy, the court may order a sum not exceeding four months' wages, and not exceeding £50, to be paid in cash; and for any surplus that may be due, the clerk or servant must prove and share with the other creditors. If the other creditors oppose a particular debt, and show it is unfounded, the court will expunge it. When all the examinations necessary of the bankrupt have been gone through, a day is appointed for considering his discharge. A discharge shall not be granted unless it is proved to the court that a dividend of ten shillings in the pound has been paid, or might have been paid, except through the negligence or fraud of the trustee; or that a special resolution of creditors has been passed to the effect that the failure to pay ten shillings in the pound has arisen from circumstances for which he was not responsible, and that they desire that an order of discharge shall be granted to him. And the court may suspend for a time, or withhold altogether, the order of discharge, if the creditors, by special resolution, have decided that the bankrupt has made default in giving up to his creditors all the property required by the act to be given up, or that a prosecution has been commenced against him for some fraudulent offense declared by the debtors act of 1869, 32 and 33 Vict. c. 62. The effect of the discharge is to free the bankrupt entirely from all debts capable of being proved under the bankruptcy. The creditors have it in their power to determine whether any and what allowance should be made to the bankrupt up to and upon his discharge.

A debtor who is unable to meet the demands of his creditors may, instead of leaving them to commence proceedings in bankruptcy, call them all together, and lay a statement of his affairs before them, when those present are to decide whether the estate shall be wound up by arrangement. Due notice of this must, however, have been given to all creditors whose debts exceed £10. The debtor must also attend and answer all questions. If the majority of creditors agree, they may thus liquidate the estate by arrangement, and they proceed somewhat in the manner usual in bankruptcy by appointing a trustee; and there is power, in case of any legal or other difficulties, to call on the court to adjudicate the debtor a bankrupt in the usual way; and in all cases the proceedings are under the surveillance of the bankruptcy court.

The criminal offenses committed by a bankrupt are such as not surrendering himself to the jurisdiction of the court at the time appointed; not making a full discovery of all his property and his dealings with it; concealing or embezzling part of his property above £10; not informing his trustee of any false debt proved under his bankruptcy; falsifying his books; fraudulently accounting for his property by fictitious losses; pawning or *mala fide* disposing of property within three months before the bankruptcy.

In Ireland bankruptcy is substantially the same process in all its features as in England.

Scotch bankruptcy, or sequestration, is substantially the same process as that which prevails in England and Ireland; but there are some differences of no small importance, besides the different names given to the steps of the process. Certain acts and conduct of the bankrupt are held to be symptoms of *notour* bankruptcy, corresponding to what are called in England acts of bankruptcy. The first step is a petition for sequestration, which may be presented by creditors whose debt must be of the same amount as in England. There is no separate court of bankruptcy, but the sheriff of the county, or the court of session, has jurisdiction to award sequestration, and the court then appoints a judicial factor, if necessary, until the creditors elect a trustee, in whom the property vests. The creditors also appoint commissioners to advise with the trustee as to the

management of the estate. The duties of the trustee and commissioners are nearly identical with those of the trustee in England. The creditors prove their debts in a similar way. There are also powers of winding up the estate under a deed of arrangement. The whole procedure in the sequestration has been very much imitated in the latest statutes passed in England. The commissioners of the creditors fix the trustee's remuneration. The trustee examines the grounds of claim of creditors, there being an appeal to the lord ordinary or sheriff, and he examines the bankrupt on oath, if necessary. On a report from the trustee as to the conduct of the bankrupt, which is not demandable by the bankrupt till five months after the sequestration, the bankrupt petitions for his discharge, and if the creditors all concur, he is entitled to his discharge at once; at later dates, if he has the concurrence of a certain number of his creditors, he is also entitled to a discharge; but if the creditors oppose, the court has a discretionary power to grant or suspend the discharge with or without conditions. In Scotland there is no distinction, as there was once for many purposes in England, between traders and non-traders. Another peculiarity of a Scotch sequestration is, that the process is applicable not only in the case of debtors who are alive, but in cases of persons who have died in insolvent circumstances; whereas in England the only remedy is an administration suit in the court of chancery. In Scotland there is a process called *cessio bonorum*, which resembles the process called insolvency in England, the principle of which is, that the debtor is only relieved from imprisonment, but not from the debt; and where the debtor has trifling assets, it is in the power of the creditors to resolve that their debtor shall not have a discharge under the sequestration, but only a decree in a *cessio bonorum* (q.v.).

With regard to the effect of a discharge under a bankruptcy in either of the three kingdoms, the rule is, that whether the bankruptcy is awarded in England, Ireland, or Scotland, all the property of the bankrupt vests in the assignee or trustee, wherever it is situated; and when the bankrupt is discharged, the discharge is thereafter complete and given effect to in all parts of the United Kingdom. Of late years, owing to the belief that it was much easier to be made a bankrupt, and obtain a discharge from debt, in Scotland than in England, various English debtors resorted to Scotland for forty days, in order that they might be made bankrupt, no doubt thinking that creditors would be less likely to oppose their discharge at that distance; and after their discharge, they returned to England and pleaded this Scotch bankruptcy. But a recent statute has given power to the Scotch courts to refuse the remedy of sequestration to debtors whose debts were chiefly contracted in England, and to remit them to their own country.

INSOLVENCY (*ante*). The distinction between insolvency and bankruptcy, so long observed in England, is unknown in the United States, where the two words are used interchangeably in legal proceedings as well as in ordinary speech. The constitution empowers congress to "establish uniform laws on the subject of bankruptcies throughout the United States." The laws of congress made in accordance with this provision have been called bankrupt laws, while those made by the states for the same purpose have generally been called insolvent laws; but this implies no essential difference in the meaning of the words. Whenever congress passes a bankrupt law, the insolvency laws of the states are thereby superseded. The first U. S. bankrupt law was enacted April 4, 1800, and repealed Dec. 19, 1803; the second, passed Aug. 19, 1841, was repealed in 1843; the third, enacted Mar. 2, 1867, was repealed May 11, 1878. These laws were alike in purpose and spirit, though differing in details. Their object was to discharge insolvent debtors upon the surrender in good faith of all their property, and to divide the same equitably among their creditors. They also provided a method whereby creditors, under certain conditions, could force a debtor into insolvency. The last law was repealed, not so much from any opposition to its main principle, as on account of the alleged needless expensiveness of some of its processes. As debtors and creditors are often citizens of different states, the operation of the state insolvent laws is often attended with much embarrassing and expensive litigation, which can be avoided only by confiding the whole matter to tribunals whose jurisdiction is not restricted by state lines. There are two different processes by which insolvent debtors in many if not all the states of the union frequently obtain their discharge, and these are sometimes preferred to a resort to proceedings in bankruptcy. One of these processes is what is known as a voluntary "composition" by the debtor with his creditors, whereby the latter agree to surrender a portion of their claims on condition that the remainder shall be paid. In such cases the parties usually enter into covenant, founded upon a sufficient consideration to make it valid, such covenant being in the form of a "composition deed" in which all the conditions of the bargain are set forth in legal form and under seal. This deed is made void by any subsequent fraud of the debtor in disposing of his property. The other method of relief is by assignment on the part of the debtor of all his property, to be equitably divided among his creditors. The assignee of the property assumes in law the responsibilities of a trustee, and is held to a faithful performance of his duty as the administrator of a trust fund. The mode of making such assignments is sometimes specifically regulated by statute. The fraudulent preference of any creditor by a debtor in contemplation of insolvency will, in general, be a sufficient ground for withholding a discharge. In many states the payment of a prior debt

within a year of the insolvency proceedings, by a debtor having reason at the time to suppose himself insolvent, will prevent his discharge. Insolvency is either voluntary or involuntary. In the case of the former the debtor himself petitions to be allowed to take the benefit of the insolvency laws and to have a distribution of his property made among his creditors for the payment of his debts; and his petition sets forth the amount of his debts and his inability to pay them. In the case of involuntary insolvency, the creditor's petition that the assets of the debtor may be distributed under the insolvency laws among his creditors, on the ground of fraudulent concealment or conveyance of the debtor's property, or of his failure to dissolve within a certain time an attachment placed upon it. Upon proof of the facts alleged in the petition, a warrant against the debtor's property issues from the proper authority, judge of probate, master in chancery, or commissioner of insolvency, as the case may be. The officer of the court, or magistrate, thereupon takes possession of the debtor's effects. A meeting of the creditors is then called, and an assignee is chosen to whom the debtor's property is conveyed. He has absolute power over the property, subject to the order of the court, collects debts, makes payments, transfers real estate, calls meetings of the creditors, etc. In most states, after all the property of the debtor has been applied in payment of his debts, he is entitled to a discharge upon consent of a certain percentage of his creditors, according to number or to the amount of their claims.

INSOMNIA. See SLEEP, *ante*.

INSPECTOR—INSPECTOR-GENERAL, terms in military affairs, having a somewhat vague signification. There are inspectors-general of cavalry, infantry, artillery, engineers, militia, and volunteers, whose duties are really those which their names infer—viz., the periodical inspection of the several corps of their respective arms, and the pointing out of deficiencies, the corps being under the command, however, of its own officers, and not of the inspector-general. The inspectors-general of musketry and gunnery instruction are charged with the direct superintendence and ordering of such instruction throughout the army. In the medical department, the inspectors-general of hospitals constitute the highest grade of surgeons, under the director-general of the whole department.

Inspectors are employed in many capacities. Inspectors of volunteers are staff officers charged with the administration and organizing of the detached corps of volunteers in their several districts. The post of inspector-general of auxiliary forces has lately been abolished, and his duties transferred to the department of the adjutant-general, in order to bring the militia and volunteers more immediately under the supervision of the commander-in-chief.

INSPECT'ORSHIP DEED is a deed executed between an insolvent person and his creditors, whereby they accept a part payment, and allow the insolvent debtor to carry on the business under their supervision, with a view to further payments.

INSPECTORS OF SCHOOLS. See NATIONAL EDUCATION.

INSPIRATION (*literally, breathing into*) is applied in theology to denote the action of the divine mind upon the human mind, whereby the latter is both supernaturally informed and qualified to communicate the information received. The term *revelation* is used more distinctively to express the first part of this action, and *inspiration* to express the second part. But, in truth, all inspiration, as the word itself bears, implies revelation. There is a necessity for supernatural qualification in the utterance of truth, only where the truth is such as has not been reached by the ordinary exercise of the human faculties, but in some degree at least supernaturally communicated. The prophet or apostle is inspired only as the utterer of knowledge beyond the ordinary reach of human intelligence.

The *inspiration of the Scriptures* signifies a supernatural qualification or special divine authority in the books of Scripture as depositories of truth. When the theologian asserts any book of the Bible to be inspired, he means that it possesses an authority different from any other book, that it contains truth not merely as any ordinary book may do, but by a special divine impress. It is different from ordinary books, as conveying in a more immediate and direct, and therefore authoritative, manner divine truth. All orthodox theologians may be said to agree in ascribing this special divine character to Holy Scripture; but further there is no agreement. The mode of inspiration, the degree and extent of it, are all subjects of dispute. On one side, there are the advocates of *plenary inspiration*, as it is called; then there are those who advocate various subordinate or partial degrees of inspiration. The advocates of plenary inspiration contend that the whole letter of Scripture is inspired, that its words were immediately dictated by the Holy Spirit, and are literary the words of God, and not of man. The several writers of Scripture were nothing more than the penmen of the Divine Spirit, under whose control they vibrated as the strings of a harp in the hands of an artist. They were as a piece of mechanism touched by God himself. Those who maintain this theory, speak, indeed, of the individuality and diverse characteristics of the writers of the Scriptures, but only as one would speak of the different tones which the same artist would produce from one and the same musical instrument. The differences are not so much in the moral or intellectual individuality of the writers

themselves, as in the diverse aims and uses with which the Holy Spirit employs them; for, according to this theory, the Divine is *all* in Scripture, and the human intelligence its mere vehicle or passive instrument. The words of Scripture are no less the words of God than if he were heard to utter them from heaven. It follows from the same theory that inspiration is essentially intermittent. It is not a higher quality of any soul, but a divine afflatus, seizing the soul at certain moments, and abandoning it at others. While the canonical epistles of St. Paul and St. Peter are to be held inspired, the words of these apostles at other times may not have possessed any special authority. The authority of the Scripture which they have delivered, however, is absolute. The inspired or theopneustic document is throughout faultless, as the sole work of the Divine Spirit, faultless equally in its form and in its essence, in its spirit and its letter. It admits of no gradation; all is equally divine, and therefore equally accurate, whether it relate to some ordinary fact, or to some great truth of the supernatural life, whether it treat of a dogma or of the details of a narrative. As one of its recent supporters writes: "Every verse of the Bible, every word of it, every syllable of it, every letter of it, is the direct utterance of the Most High." It follows no less that what God has thus miraculously written, he must have miraculously preserved. A providential canon is the plain sequence of a plenarily inspired Bible.

In opposition to this theory are various others, all of which impose certain limits upon the perfection of Scripture. Some confine inspiration to all that is directly religious in the Bible, to all that is directly of the character of revelation, leaving out of the question all that belongs to the sphere of science or ordinary history. Others exempt the form or letter of Scripture, and attribute inspiration only to its spirit, ideas, or doctrines. Others go still further, and comprise in the fallible form the mode of argument and expository details. Each of these theories supposes inspiration to be connected primarily with the authors rather than with the books of Scripture, sometimes with the extraordinary gifts accompanying the first preachers of the Word of God, sometimes with the peculiar privileges of prophets or apostles, and sometimes with their special position as immediate witnesses of the facts of revelation and their singular religious aptitude. Whatever differences may characterize the advocates of these respective views, it is plain that they, one and all, have abandoned the ground of the absolute infallibility of the letter of Scripture.

In a matter of controversy like the present, it is not our function to determine in favor of any particular view, but simply to indicate what the more important opinions are, and the grounds on which they are held. Those who claim for the letter of the Bible a freedom from all error or imperfection, do so on the *à priori* ground of necessity; such infallibility is held to be implied in the very idea of a revelation of the divine will; while those passages which seem inconsistent with the facts of science or of history, or with other parts of the Bible itself, admit, it is maintained, of satisfactory explanation. For such reconciliations of apparent discrepancies our readers are referred to the current commentaries and harmonies. Those theologians, again, who deny the necessity of infallibility, and hold that the inconsistencies referred to never have and never can be satisfactorily explained away (and their number has been for some time on the increase), argue in the following way: it is plain, first of all, and especially, that the question is not one to be settled according to any preconception, but according to the evidence of the facts given us in Scripture. The only right idea of inspiration is, as one has said, "that which we form from our knowledge of the Bible itself. It is a question to be solved not by speculating what the Bible ought to be, but by examining what it actually is." All *à priori* arguments are evidently at once inapplicable and dangerous on such a subject. The partisans of plenary inspiration maintain that it is necessary to the preservation of faith to hold, that God has not only revealed the truth to man, but that he has deposited that truth in an infallible record. Not only so; but the infallibility of the canon is no less indispensable; for all would be lost if any doubt was allowed to rest upon any portion of the Word of God. But if an infallible text and an infallible canon be necessary, why not also an infallible interpretation? Without the latter, the two former may be of no use. All may be lost by a false or defective commentary of the sacred text. It is plain that the idea of verbal inspiration cannot stop short of the conclusion of an infallible interpretation; and even such a conclusion, which upsets Protestantism, by denying the right of free inquiry, would not save it; for an infallible commentary would not necessarily insure infallible instruction—all might still be lost by the weakness, ignorance, or defect of the recipient mind. No infallibility of text, of canon, or even of interpretation, could insure the infallible reception of the truth, thus trebly guarded. If we would not be caught, then, in this absurd chain of assumption, we must break its first link, and ask, not what the Bible must be or should be, but what it is. This view is strongly argued in a recent treatise on inspiration by M. de Pressensé, one of the most distinguished of the French Protestant divines belonging to the evangelical school of theology. According to this writer, who may be taken as the representative of a large class of theological thinkers, the Bible is a mass of documents of varying age and varying authenticity; its text has undergone the usual changes attending the transmission of historical documents; it is marked by the usual inequalities and varieties of style that we meet with in any other

collection of ancient literature; it presents in many cases peculiar difficulties, differences and even contradictions of detail, scientific and historical errors. All who have studied the gospels minutely, and especially the quotations in the gospels and the epistles of St. Paul from the Old Testament, know that there are various inaccuracies and misapplications of facts throughout them. The same microscope of criticism that reveals to us the depths of the inner meaning of the divine message in all its manifold fullness, reveals to us also the imperfections, and even the contradictions, of the human messenger. The following are only a few of the instances in which such "imperfections and contradictions" show themselves.

1. The recital of the temptation in St. Matthew and St. Luke. In the former (Matt. iv. 6-8), the vision from the pinnacle of the temple is placed first; in the latter (Luke iv. 1-10), that from a lofty mountain takes precedence.

2. In Matt. x. 10, Jesus commands his apostles to take for their missionary journey neither "scrip, neither two coats, neither shoes, *nor yet staves.*" In Mark vi. 8, he commands them to "take nothing for their journey, save a staff only."

3. In the narrative of the passion, as in that of the resurrection, there are numerous contradictions of detail resting on a fundamental and striking unity. According to Mark xiv. 72, the cock is represented as crowing on each of the first and second occasions on which Peter denies his Lord. In the accounts given by the other evangelists, the cock only crows upon the third denial (Matt. xxvi. 74; Luke xxii. 60). The statement of the death of Judas differs materially in Matthew and in the Acts of the Apostles. According to the former, Judas casts down the pieces of silver, and departs and hangs himself; and the chief priests *afterwards* purchase with the price of his guilt the potter's field for the burial of strangers, hence called the field of blood. According to the Acts of the Apostles i. 18, Judas himself is represented as having purchased the field "with the reward of iniquity;" then as having in some way (not explicitly stated in the narrative) met there a bloody death, from which circumstance the field took its name. In the narratives of the resurrection, it is well known there are numerous variations; and numerous palpable errors of memory as to historical facts occur, such as may be seen by comparing Mark ii. 26 with 1 Sam. xxi. 2-6, and 1 Cor. x. 8 with Numb. xxv. 9.

4. As to the citations of the Old Testament in the New, they are almost entirely taken from the Septuagint, and evidently in many cases quoted from memory, with little regard to their exact sense in the original. Thus, St. Matthew (ii. 6), in applying to the Messiah the prophecy of Micah (v. 2), says of Bethlehem precisely the reverse of the Septuagint. "Thou art too little to be reckoned among the thousands of Juda," he translates: "Thou art not the least among the princes of Juda." In many cases, the New Testament writers, while repeating the inaccuracies of the Septuagint translation, turn them to admirable account; this is especially remarkable in the gospel of St. Matthew and the epistles of St. Paul. Thus (iii. 3) St. Matthew translates with the Septuagint: "The voice of one crying in the wilderness;" while the Hebrew is: "A voice cries, make plain in the wilderness the ways of the Lord" (Isaiah xl. 3). Compare also Matt. xii. 21 and Isaiah xlvi. 4, also Matt. xv. 8 and Isaiah xxix. 13.

None of these errors, it is maintained, are of any material consequence so far as the substantial veracity of Scripture is concerned. The very fact that a microscopic criticism can detect no more serious inconsistencies in the scriptural writers, is rightly held to be one of the most striking testimonies that could be given to their truthfulness. Such slight inaccuracies are the mere freedoms which writers, thoroughly honest, and animated with a high interest which overlooks trifles, permit themselves. But however unimportant in themselves, they are considered by many theologians to be altogether inconsistent with a theory of verbal inspiration. However minute, they are recognized as real *discrepancies*—human imperfections in the sacred record—and as consequently proving that the mere text or letter of Scripture is not infallible, that it cannot be regarded as a "direct utterance of the Most High."

Inspiration, therefore, according to these theologians, does not imply the infallibility of the scriptural text; it is something consistent with scientific, historical, exegetical, and even argumentative errors (witness, to quote no other example, St. Paul's allegorical argument about the sons of Abraham, Gal. iv. 22, 25). There is nothing valid, no divine authoritative element, it may be said, that can survive such deductions. If there are such errors in Scripture, why may it not all be imperfect or erroneous? The sufficient answer is, that it is not so—that, judged by the very same critical tests which detect such errors, the Bible remains an entirely *unique* book. Every Christian mind recognizes in it a higher divine knowledge and authority than in aught else. The divine spirit in Scripture makes itself felt, shines forth in every page of it; and this is inspiration in the highest sense, the mind of God meeting our minds in Scripture, enlightening, guiding, elevating, purifying them. There is nothing more in reality to be got from any theory than this. An inspired letter, or *word*, or message is nothing to any one *in itself*; the meaning is everything. We must understand the word or message. There is no degree of objective authority that can supersede this subjective process of apprehension on our part. There cannot, therefore, be immunity from error, let the symbol or the text be as perfect as possible. It is only to us what *we* see it to mean; and this meaning, in the case of Scripture, shines with a divine power and luster

such as invest no other book. It bears its own divine witness. In such an idea of inspiration, criticism finds nothing inconsistent, nothing impossible, and no higher idea can be well formed of it.

INSPIRED, THE, or COMMUNITY OF TRUE INSPIRATION, a small body of Christians who profess to derive their origin from pietists of Germany and from French Protestants of the Cevennes—a remnant of the Albigenses—named Camisards from the peculiar dress they wore. They receive the teachings of the German mystics, Böhme and Schwenckfeld, and cherish evangelical opinions, but do not use the sacraments. They claim at times to be divinely inspired, retaining their mental activity, but becoming insensible to outward things. They hold their property to some extent in common. In 1844 they established a community at Ebenezer, Erie co., N. Y., which continued 10 years. They then removed to Iowa, and have now settlements in that state and in Canada.

INSTALLATION, in church law, means the ceremonial act or process by which a person presented and legally confirmed in a benefice is formally put into possession of his office, and by which he is fully empowered not alone to exercise its functions, but to enjoy its honors and emoluments. The ceremonial form, as well as the name, differs according to the office which is conferred, as "euthronization" for a bishop, "induction" for a rector, etc. "Installation" properly regards the office of a canon or prebendary. The word is also used generally for a formal introduction to any office.

INSTERBURG, a t. of Prussia, in the province of east Prussia, is pleasantly situated on the left bank of the Angerap, 15 m. w.n.w. of Gumbinnen. It contains a castle, and several educational institutions. Cloth-weaving, tanning, brewing, and distilling, with a trade in corn and linseed, are carried on. Pop. '75, 16,380. Insterburg had its origin in a castle of the Teutonic order of knights, built here at an early period. At the close of the 16th c. it had attained the rank of a town, which increased considerably after the 17th c. about which time a number of Scottish families settled at Insterburg on account of its trade.

INSTINCT. It has been common to describe the actions of the lower animals as guided by principles different from what obtains in the human constitution. The power of self-preservation is considered as reason in man, and as instinct in the brutes; but this contrast does not contain a real opposition. There is much that is common in the impulses of men and animals. When an animal, having found a morsel agreeable to its taste, masticates and swallows it, and takes up another of the same, the mental operation is not essentially different from what a human being would go through in the like circumstances. In both instances we have an example of the exercise of will, or volition, which operates to promote the pleasures and ward off the pains of the sentient being.

The most important meaning connected with the term instinct is what contrasts with experience, education and acquired knowledge. The original or innate tendencies and powers of the mind are to be distinguished from the powers that grow up in the course of the animal's experience of the world, and its companionship with other living creatures. There has been a disposition to underrate the acquired aptitudes of the inferior animals, and to refer their capability of self-preservation purely to their natural or primitive endowments. But in point of fact men and animals alike possess both instincts and acquisitions; for although in man the preponderance is greatly in favor of the acquired, he, too, must start from something primordial, the basis of the other.

In the first place, there are certain actions of importance to the safety and well-being of the individual that are termed reflex, or automatic. They seem to be almost out of the sphere of mind proper, as they are performed even unconsciously. Among these are the propulsion of the food along the alimentary canal, sneezing, respiration, etc. In all these we have important activities, which are inherent in the constitution, and are performed as effectually at the beginning of life as at the full maturity of the being.

In the second place, there is a certain original provision for rhythmical and combined movements among the active organs, more especially those concerned in locomotion. Thus, there is a natural tendency to alternate the limbs, although the human infant cannot turn this to account at once for the ends of walking, as some of the quadrupeds can. From this alternation the two eyes and the two sides of the face are specially exempted, and brought under another arrangement equally primitive—namely, concurrence. But all these cases alike illustrate the presence of an original mechanism of the frame, by which the movements are grouped up to a certain point.

In the third place, it may be safely maintained that there is an inborn tendency in all animals to *act somehow*, or to put forth the energies that they possess, without waiting for the stimulus of their sensations. This spontaneous activity is shown more or less in every creature after rest and nutrition (see SPONTANEITY). Destitute of any special direction at the outset, it yet prompts to a great many experiments or trials upon things, in the course of which the animal discriminates the suitable from the unsuitable by means of its sensations, and thereby learns to follow up the one and eschew the other.

Fourthly, in connection with our emotions there are certain primitive links of mental state with bodily manifestation, which constitute a natural language of the feel-

ings understood by the whole human race. The meaning of the smile, the frown, the sob, the contortion of pain, is uniform, and therefore instinctive. See EMOTION.

Fifthly, the power of will or volition, although it can be shown to be a *growth*, must have some primitive and instinctive elements in the constitution to start from. See WILL.

Sixthly, there must be certain primordial powers of the human intellect. What these are, has been much disputed. Every one must concede the existence of some intellectual forces or faculties, as, for example, discrimination, the basis of all knowledge; retentiveness, the faculty of acquiring everything that is acquired; and agreement, or similarity (see INTELLECT); but it is contended by one school that we possess not merely powers of receiving knowledge by our contact with the world, and our consciousness of our minds, but *actual notions or ideas* that cannot be traced to our experience of the material or mental phenomena that we encounter. This is the doctrine of innate ideas, intuitive conceptions, *a priori* cognitions and judgments, first truths, etc. See COMMON SENSE.

Animals possess, as a rule, the instincts of human beings, with some that are special to themselves. They have the reflex actions above enumerated; they have, even in a more decisive form, the primitive combined movements for locomotion and other purposes; they have the spontaneous activities that come under control in their voluntary acts; they have emotional manifestations that are eminent, although their organs of expression are fewer; they have certain rudimentary powers, which are developed by experience into the activity of the will.

There are certain intellectual judgments that in man are mainly, if not wholly, the result of experience, but in animals are instinctive. The chief of these is the appreciation of distance and direction, which is shown in the ability to take an aim, as in birds pecking their food soon after they are born. The higher quadrupeds learn to feed themselves in a space of time too short for acquisition. It would seem also that animals have instinctive notions of things, as in the case of the aquatic animals knowing water at first sight, a fact generally affirmed, and not easy to contradict. In the same way, they may know their food at first sight before tasting it.

It is in connection with sociability that we have the largest compass of undoubted instincts. Animals seem to know their own species by intuitive perception. Predatory animals certainly recognize their prey by instinctive perception; the young kitten is aroused by the sight of a mouse; the dog pursues a cat with a decision and vehemence that could not be given by education. So animals that are preyed upon intuitively dread their captors.

While pleasure and pain must be regarded as fundamental attributes of the mind, inseparable from its working, the more special modes of feeling called emotions, as love, anger, fear, are states superinduced upon the primary modes of feeling, and as they appear from the earliest moments of life, they are properly termed instincts, being common to man and to animals.

Among the most notable instincts are the constructions of forethought—as the nests of birds, the cells of bees and wasps, the ant-hills, the beaver's dwellings, the spider's web; also the precautionary movements of animals, as in the migrations of birds and fishes, according to season. The striking and extraordinary anecdotes given of the sagacity of some animals, as the dog, the horse, the cat, the elephant, do not, properly speaking, exemplify instinct; they involve experience, memory, and reason, which animals are capable of in a greater or less degree, and with great individual differences, even in the same species. Respecting these various instinctive aptitudes, the account given until lately was that each distinct animal species was originally created so; and that the powers belonging to each were handed down without change from parents to offspring. A new rendering of the phenomena has been given in the doctrine of evolution. According to this doctrine, as applied to mind, instincts are experiences and acquisitions that have become hereditary.

"Though reflex and instinctive sequences are not determined by the experience of the *individual* organism manifesting them, yet the experiences of the *race* of organisms forming its ancestry may have determined them. Hereditary transmission applies to mental peculiarities as well as to physical peculiarities. While the modified bodily structure produced by new habits of life is bequeathed to future generations, the modified nervous structure produced by such new habits of life are also bequeathed; and if the new habits become permanent, the tendencies become permanent. Let us glance at the facts: Among the families of a civilized society, the changes of occupation and habit from generation to generation, and the intermarriage of families having different occupations and habits, greatly confuse the evidence of mental heredity. But it needs only to contrast national characters to see that mental peculiarities caused by habit become hereditary. We know that there are warlike, peaceful, nomadic, maritime, hunting, commercial races—races that are independent or slavish, active or slothful; we know that many of these, if not all, have a common origin; and hence it is inferable that these varieties of disposition, which have evident relations to modes of life, have been gradually produced in the course of generations. In domesticated animals, parallel facts are familiar. Not only the forms and constitutions, but the dispositions and instincts of horses, oxen, sheep, pigs, fowls, have become different from those of their wild kindred. The various breeds of dogs exhibit numerous varieties of mental character and faculty per-

manently established by mode of life; and their several tendencies are spontaneously manifested. A young pointer will point out a covey, the first time he is taken afield" (Spencer's *Psychology*, vol. i., p. 422).

The strongest evidence, however, for the evolution theory is the remarkable similarity between instincts and acquisitions. Our instincts are just the powers that we need for our support and preservation, and that we should acquire by trying what actions are best suited for this purpose. An animal coming into the world unable to adjust the movements of its limbs, head, and mouth, to pick up the food that lies before it, would have to learn these movements as quickly as possible. Once acquired, they persist, and if very strongly embodied in the nervous system, they may be transmitted in a more or less perfect form to the next generation. Even granting that the transmission is not full and complete, a sufficient trace may be left to render the acquisition comparatively short. There are a great many instincts that need a certain amount of practice to make them operative; the first attempts at locomotion in most animals are feeble and awkward.

INSTITUTE, a term used in Scotch entail law to denote the person who is first mentioned or described as entitled to take the entailed estate. All those who come after him are called substitutes. When the institute dies before the entailer, the next person mentioned takes as institute. There are certain rules of construction which favor the institute, but these are entirely technical.

INSTITUTE, THE, English law, is the mode of citation or reference to chief-justice Coke's great work, in four volumes, on English law. Another name for the first part of it is *Coke upon Littleton*, owing to its being a commentary by Coke upon a work of Littleton. The second book is a comment on acts of parliament, the third is a treatise on the pleas of the crown, and the fourth on the different kinds of courts.

INSTITUTE OF FRANCE. On the revival of letters, associations for mutual intercourse and co-operation, called academies (q.v.), were formed in Italy and France, one of which, composed of poets of no great note, was converted by Richelieu into a national institution, under the name of *Académie Française*, and met for the first time July 10, 1637. The chief object of this institution was the cultivation of the French language; but this was indifferently accomplished, owing to the intermeddling of the court, which arrogated to itself the right of directing the public taste. Many of the judgments of this academy were strangely erroneous—e. g., its rejection of the *Cid* of Corneille, and its refusal to admit Molière, Boileau, and La Bruyère as members. The academy was intrusted with the preparation of a dictionary of the French language; but the merits of this work have been much disputed, and the plan of it generally condemned.—The taste for devices, inscriptions and medals, which prevailed in the 17th c., suggested to Louis XIV. the foundation of the *Académie des Inscriptions* in 1663, for the immediate object of examining his collection of medals and other antiquities; but the abbé Bignon, superintendent of the royal library, secured its perpetuation, with an extension of its field of labor, as the *Académie Royale des Inscriptions et Belles-lettres*, under which designation it met for the first time July 16, 1701.—The third academy in order, and at present the most distinguished scientific association in the world, the *Académie Royale des Sciences*, was founded by Colbert in 1666, remodeled by Bignon in 1699, and further enlarged in 1785.—The painter, Le Brun, founded in 1648 an *Académie de Peinture*, for which he obtained a charter in 1655; and in 1664, Colbert remodeled and established it as the *Académie Royale de Peinture et Sculpture*.—An *Académie Royale d'Architecture* was also founded.

All these academies were suppressed by an edict of the convention, Aug. 8, 1793; but on Oct. 25, 1795, the directory established a great national association for the promotion of the arts and sciences, called the *Institut National*. It was at first divided into three classes: viz., sciences physiques et mathématiques; sciences morales et politiques; sciences de littérature et beaux-arts; but on the suppression of the second class by the first consul in 1803, the remaining classes were rearranged as follows: sciences physiques et mathématiques; langue et littérature Française; histoire et littérature ancienne; beaux-arts; and this arrangement continued during the empire. On March 21, 1816, a royal ordinance commanded that the four classes should be replaced by four academies, but the general title, "Institute of France," was retained, being modified by the epithet "royal," "imperial," or "national," in harmony with the political changes in France. Since 1870 it is, of course, the *Institut National*. The four academies are: 1. *L'Académie Française*; 2. *L'Académie des Inscriptions et Belles-lettres*; 3. *L'Académie des Sciences*; 4. *L'Académie des Beaux-Arts*; and an ordinance, bearing date, Oct. 26, 1832, re-established the old second class as a fifth academy, *L'Académie des Sciences Morales et Politiques*, and this organization still subsists.

Each academy has its own independent government, and the free disposition of the funds allotted to it, an agency and secretaries; the library and the valuable collections of the institute are common to the five; the common fund is managed by a committee of ten members (two from each academy), under the presidency of the minister of public instruction. Members are elected by ballot, the election requiring to be confirmed by government, and members of one academy may be elected as members of any or all of the other four. Each member has an annual salary of 1500 francs, and the secretaries

have 6,000. Each member also receives a napolcon for each meeting of the academy at which he is present, but is liable to a fine if absent for a whole year, or to expulsion for a prolonged absence without sufficient cause shown. Each academy meets once a week for two hours; each has also one public annual sitting; and on Aug. 15 there is a general public meeting of the whole five. All the academies, with the exception of the first, have a certain number of *académiciens libres*, *associés étrangers*, and *correspondants*; the “*académiciens libres*” have only the right of attending the meetings of the academy; the “*associés étrangers*” are foreign members. The following table gives the full complement of members and correspondents for each academy:

	Members.	Académiciens Libres.	Associés Étrangers.	Correspondants.
1. Académie Française.....	40	...	8	50
2. “ des Inscriptions et Belles-lettres.....	40	10	8	100
3. “ des Sciences.....	65	10	10	40
4. “ des Beaux-Arts	41	10	6	46
5. “ des Sciences Morales et Politiques.....	40	6	22	236
	226	36		

Among the *associés étrangers* in 1874 there were in the 2d academy, prof. Max Müller; in the 3d, profs. Owen, Airy, and Wheatstone; and in the 5th, the right hon. W. E. Gladstone, and the right hon. earl Stanhope. Of correspondents, Mr. Thomas Wright belonged to the 2d, as did also sir H. Rawlinson, Mr. Layard, and Dr. John Muir of Edinburgh. Late correspondents with the various academies were prof. Faraday, sir D. Brewster, sir J. W. Herschel, lord Brougham, Mr. McCulloch, Mr. Grote, and Drs. Whewell and Whately. The *Académie Française* occupies itself with debates on grammar, rhetoric, poetry, and French literature in general, and its great work is the preparation and continual improvement of a dictionary of the French language. It has the disposal of two prizes of 10,000 francs each, one of 2000 francs, and every alternate year a sum of 1500 francs to be bestowed on meritorious authors in poor circumstances. The *Académie des Inscriptions et Belles-lettres* has for its subject history in its most comprehensive sense, including chronology, geography, numismatology, and the study of monuments of every kind, and of the languages of all nations at all times. It has in its gift a prize of 2000 francs, and another for numismatology. The *Académie des Sciences* has for its subject statistics, pure and mixed mathematics, medical science, etc.; and has the gift of eleven prizes, several of which are of 10,000 francs; all are annual, with the exception of one, which is decennial. The *Académie des Beaux-Arts* occupies itself with painting, sculpture, architecture, engraving and music; and with the preparation of a dictionary of the fine arts, and alternately with the first academy, distributes the sum of 1500 francs among poor meritorious authors. The *Académie des Sciences Morales et Politiques* discusses mental philosophy, law and jurisprudence, political economy and statistics, general and philosophical history, and politics, administration, and finance; and has the gift of two prizes—one decennial, the other quinquennial. There is also a Bordin prize in the gift of each academy; and two general prizes—one annual, the other triennial—in the gift of the institute.

Each year a sum is voted by the French government for the general fund of the institute, and from this fund are paid the allowances of members, salaries of the secretaries and other officials, and several prizes; also experiments, printing, etc.

INSTITUTES is the name given to the elementary treatise on the Roman or civil law. See **LAW, ROMAN, CIVIL.**

INSTITUTION, in church law, means the final and authoritative appointment to a church benefice—more especially a bishopric—by the person with whom such right of appointment ultimately rests. Thus, in the Roman Catholic church—even after the “election” of a bishop by the chapter, or his “nomination” by the crown, when that right belongs to the crown—it is only the pope who confers “institution.” In English usage, institution is a conveyance of the cure of souls by the bishop, who, or whose deputy, reads the words of the institution, while the clerk kneels. The institution vests the benefice in the clerk, for the purpose of spiritual duty, who thereupon becomes entitled to the profits thereof. But the title is not complete till induction (q.v.).

INSTRUMENT, in point of law, is scarcely a technical term, though it is frequently used in England as descriptive of a will or testamentary writing—and often any document not under seal. In Scotland, on the other hand, it is usually descriptive only of a notarial instrument.

INSTRUMENTATION is the arranging of music for a combined number of instruments. The nature and character of the musical ideas must alone determine whether the instrumentation shall be simple or artistic, and perhaps complex; the latter being the case when some of the instruments take a more prominent part than others. For both purposes, a thorough knowledge of every instrument in the orchestra is absolutely necessary, as without this, instrumentation becomes only a deafening mass of sounds. The stringed

instruments, from their nature, in most cases, form the principal parts of a score, around which the other instruments move, without depriving them of their importance. The wind instruments represent, more or less, as it were, a subordinate chorus, which may again be divided into two kinds, viz., the wood instruments and the brass, which, with the stringed instruments, give three essentially different choral effects, that may be mixed up together in endless variety. A knowledge of the art of instrumentation is only to be acquired by great experience; at the same time much may be learned by consulting the following works: *Die Instrumentirung für das Orchestra*, by Sundelin; the German text-books on instrumentation by Marx and Lobe; Berlioz, *Traité d'Instrumentation*; Gassner, *Partiturkenntniss*.

INSTRUMENTS, MUSICAL, may be divided into three classes—stringed, wind, and percussion. Stringed instruments are of three kinds: those whose sounds are produced by friction, as the violin, viola, violoncello, etc.; by twitching with the finger or otherwise, as the harp, guitar, mandoline, etc.; by striking, as the pianoforte and dulcimer. Wind instruments are of two kinds, viz., the reed species—as the hautboy, clarionet, etc.—and the flute species, as the flute, flageolet, etc. The trumpet, horn, trombone, and all similar wind instruments, are generally classed among the reed instruments; but whether the sound is produced by the lips of the blower acting as a reed, or by the compressed stream of air, as in flute instruments, is not yet determined. Percussion instruments are those which on being struck produce only one fixed sound, as the drum, triangle, cymbals, tambourine, etc. Whatever material may be used to form a musical instrument, there are only two means of producing musical sounds, and these are by the vibrations of a fixed elastic body, such as the string of the violin or pianoforte, the reed of the hautboy, bassoon, etc.; or by the vibrations of a confined column of air put into motion by a stream of compressed air, as in the flute, flageolet, and all the ordinary flute species of organ-pipes.

INSUCKEN MULTURES, in Scotch law, mean the payments made to the miller by persons who are bound to grind their corn at a particular mill, under a servitude called thirlage (q.v.). Outsucken multures mean the payment for the mere grinding, which strangers pay; and the insucken multures include that *plus* a small premium, which goes to the proprietor of the mill.

INSURANCE, a contract of indemnity, whereby one party, in consideration of a specified payment, called a "premium," undertakes to guarantee another against risk of loss. The first principles of insurance would appear to have been acted on at a very early period, since, without attaching undue importance to the opinions of writers who contend, on the authority of Livy, that they were known during the second Punic war, or that the emperor Claudius can be considered an insurer, because, in order to encourage the importation of corn, he took all the loss or damage it might sustain upon himself—there are yet extant rules of sundry "guilds," or social corporations of the Anglo-Saxons, whereby, in return for certain fixed contributions, the members guarantee each other against loss from "fire, water, robbery, or other calamity." It was, however, to cover maritime casualties that insurance, viewed in its commercial aspect, seems to have been first undertaken. So early as 1435 the magistrates of Barcelona issued an ordinance relating to this class of business, and we find in the speech of the lord keeper Bacon, on opening queen Elizabeth's first parliament, the allusion, "doth not the wise merchant, in every adventure of danger, give part to have the rest assured." The merit of being the first to apply mathematical calculations to the valuation of human life belongs to the famous John de Witt, pensionary counselor of Holland, whose report to the states-general on the valuation of life annuities has been lately brought to light by Mr. Hendriks. The first insurance company established in Britain appears to have been the "Amicable," founded in 1696; not the office known by that name now, but the one that still exists as the "Hand in Hand." Omitting the gambling and other objectionable projects for which the science of insurance has been held responsible, it would exceed the limits of the present article to give any detailed account of even the more legitimate applications of it which are current at the present day: the traveler can be protected from the pecuniary loss entailed from damage by rail or flood; the gardener from the devastation of the hailstorm; the farmer from the inroads of disease among his cattle; and employer and employed alike reap the benefit of a guarantee on fidelity. 126 established life offices within the United Kingdom appeared in an accredited list published in 1874, and although there were, besides, 66 winding up in chancery, there is an amount of confidence to be placed in the stability and integrity of the greater number existing that cannot be exceeded in any other commercial interest. We propose confining our remaining remarks to the divisions of fire, life, and marine insurance.

1. *Fire Insurance*.—Although the business of fire insurance is not founded upon such exact data as can be made available in the practice of life insurance, yet considerable progress has been made by the offices towards a correct classification of the risks they run, and the rates of premium range by slight gradations from a minimum of 1s. 6d. per cent, which covers an ordinary private dwelling-house, to £3 3s. per cent and upwards, charged for insuring cotton-mills, sugar-refineries, theaters, and like specially hazardous risks. The average rate of premium received for risks in the United Kingdom may be estimated at 4s. per cent. A duty of 3s. per cent per annum used to be

levied by government upon all fire insurances, except farming-stock and public hospitals, and the parliamentary returns made of it afforded valuable statistical information of the total amount insured. The duty paid in the year 1860 amounted to £1,558,608, representing a gross amount insured over the year of £1,039,072,140; and farming-stock, £73,309,898. Since the repeal, in 1869, of the act which levied a duty upon fire insurances, no data remain for estimating the total value of those now effected in this country. The "life assurance company's act, 1870," provided only for the publication of the accounts of such fire offices as do life business also. The local returns made to the board of works, upon which to estimate the contributions of the companies for the maintenance of the fire brigade, afford incidentally an interesting proof of the wealth of the metropolis, and of the magnitude of its business operations. Over the area mentioned, which excludes the important warehouses of the Victoria docks, the returns exhibited by the resident companies of insurances for 1873 showed a total value of property covered of upwards of £488,500,000. Fire insurance policies are of too familiar use to require explanation here, but one point in connection with them may be noticed: unlike a marine policy, they guarantee the insured to the extent of the whole amount specified in them, without regard to the excess of value of the entire property before the fire, unless an exceptional "average clause" is attached to the policy.

2. *Life Assurance*, in its widest sense, is a contract entered into by the assurer to pay a certain benefit contingent upon the duration of one or more lives. The "present value" or single premium corresponding to an assurance of £1, payable at the end of the year of death of an individual, is deduced from the value of an annuity on the same life (see ANNUITY), and is expressed by the formula $v = (1 - v) A_x$, where v is the sum which will amount to £1 in one year (therefore equal to $\frac{1}{1+r}$, r being the interest of £1 for a year), and A_x is the value of an annuity of £1 per annum on the life aged x .

The more common form in which a life assurance is carried out is, however, by the payment of an annual premium to the company assuring, and this is determined (using the same symbols as above) by the formula $\frac{1}{1+A_x} - (1-v)$. The truth of which is thus demonstrated in a popular form by Mr. Gray. The present value of an "immediate" annuity on a life aged x —i.e., of an annuity of which the first payment falls to be made at the commencement of the transaction—being $1+A_x$, it is easily deduced by proportion that £1 will purchase an immediate annuity of $\frac{1}{1+A_x}$, the reciprocal of the first value; and this would be the proper premium for the benefit if the latter were paid to the assured at the beginning of the first and not at the end of the last year of the duration of the policy; but inasmuch as the benefit is not paid until the close of the stipulated period, the difference between its immediate value and its value if due a year hence ($1-v$) has to be deducted from each year's premium, and the formula is the result.

The three important elements that have to be taken into account in the calculation of office premiums are—the rate of interest which is to accrue from their investment, the mortality returns with which the future experience of the insured is expected to agree, and the proportion or "loading" to be added to the *net* rates to meet expenses of management, and afford a profit to the insurer. The rate of 3 per cent has, with a very few exceptions, been adopted as a basis for such calculations, as the nearest to what can be expected to be realized on good security for transactions extending over many years. The mortality table most generally in use is that originally published by Mr. Milne, derived from the observations of Dr. Heysham on the rate of mortality in Carlisle during the nine years 1779 to 1787 inclusive, and hence known as the Carlisle table. This, however, is now being superseded by the mortality experience of life assurance companies, collected by the institute of actuaries, and published in May, 1869, exhibiting certainly the most correct standard of assured life in this country, and possessing, by reason of the great skill with which it has been graduated, a complete adaptation for all practical purposes.

The following are examples of *net* premiums calculated on the institute data:

SINGLE AND ANNUAL PREMIUMS FOR ASSURANCE OF £100, FOR WHOLE OF LIFE—
INSTITUTE TABLE H^m, 3 PER CENT.

Age.	Single premium.			Annual premium.		
	£	s.	d.	£	s.	d.
20.	32	17	9	1	8	7
25.	35	16	3	1	12	6
30.	39	4	5	1	17	7
35.	42	19	0	2	3	10
40.	47	1	2	2	11	9
45.	51	13	5	3	2	3
50.	56	12	3	3	16	0
55.	61	17	3	4	14	6
60.	67	5	6	5	19	9

For comparison, we append the corresponding premiums, calculated on the Carlisle data:

SINGLE AND ANNUAL PREMIUMS FOR ASSURANCE OF £100, FOR WHOLE OF LIFE—
CARLISLE, 3 PER CENT.

Age.	Single premium.			Annual premium.		
	£	s.	d.	£	s.	d.
20.	33	17	11 $\frac{1}{2}$	1	9	10 $\frac{1}{2}$
25.	36	17	10 $\frac{3}{4}$	1	14	0 $\frac{3}{4}$
30.	40	2	6	1	19	0 $\frac{1}{2}$
35.	43	7	11 $\frac{1}{4}$	2	4	8
40.	47	3	2	2	11	11 $\frac{3}{4}$
45.	50	17	8 $\frac{1}{4}$	3	0	4 $\frac{1}{4}$
50.	55	8	7 $\frac{1}{4}$	3	12	5 $\frac{1}{4}$
55.	60	18	11	4	10	10 $\frac{3}{4}$
60.	66	10	7 $\frac{1}{4}$	5	15	9 $\frac{1}{2}$

The question of the addition to be made to such (net) premiums is influenced by different considerations having regard to the practice of the office using the table.

Assurance companies are divided into three classes: 1. *Proprietary companies*, being those offices possessing a capital the property of the partners, and which, in addition to the accumulated premiums, is pledged to the policy-holders as a guarantee for the fulfillment of their claims. As the liability in such companies is limited to the net sums assured, the addition made to the premiums requires to be only such a proportion as will cover the actual outlay for management, and remunerate the shareholders for the risk of loss which they run by fluctuation in the mortality, or from bad investments. A comparison of the above premiums with the “non-participation” rates usually advertised, will show that the prevailing competition has induced the construction of tables very favorable to the public. 2. *Mutual offices*, where the members themselves constitute the company, being liable to each other for all claims. Here, in the absence of a capital, it is usual to adopt a scale of premiums known to be in excess of what is required to meet the sums insured. The profit arising therefrom is periodically ascertained, and allotted to the assured, most frequently in the form of “bonuses” or additions to the claims payable under the policies. Some companies doing a large business are of this class, and in point of stability and irreproachable management bear the highest character. 3. *Mixed companies* are proprietary companies charging such increased rates as will yield a bonus, but which, in return for the expenses of management and guarantee of their capital, reserve for their proprietors a stipulated proportion of the profits.

It would be beyond our province to deal with the comparative merits of these systems; undoubtedly, offices in which the assured participate in a part or the whole of the profits, have for some years back enjoyed the largest share of public support. Life-assurance, in the abstract, is certainly one of the greatest blessings of modern times. The extent to which it has been made available may be judged from the fact that the total sum, including vested bonuses, for which the existing offices are liable is above £343,000,000 sterling; the annual premiums payable, therefore, being above 10,000,000—a sum equal to one-seventh of the net public revenue of the United Kingdom, or nearly half of the entire customs duties.

A greatly increased facility for making the necessary calculations in connection with life-assurance has been developed within the last few years by the use of “commutation tables,” the invention of Mr. George Barrett, and of which a large collection, calculated by Mr. D. Jones, is published by the society for the diffusion of useful knowledge. For the best information on their construction, and other formulæ, the reader is referred to the standard works of De Morgan, Gray, Milne, and the transactions of the institute of actuaries, published quarterly. See *Post-Office Insurance*.

3. *Marine Insurance*.—Although this branch of the subject does not possess such a general interest as the preceding, it is one that requires quite as great an amount of study and experience to insure its successful prosecution. In estimating the rate of premium, the insurer has to take into account not only the quality of the vessel covered, but the season in which she sails, the known character of her captain, the nature of the commodity carried, and (the contract being an indemnification both against the elements and the enemy) the state of our political relations. Nevertheless, losses at sea, like other incidents, are observed to follow certain laws, and if the average from which the value of the risk is deduced is of sufficiently broad basis, the result over equal intervals of time can be predicted with reasonable certainty. Until 1824 the only *companies* that could grant marine insurances were the Royal Exchange and London Assurance; and although the monopoly of these offices then ceased, and many other companies have since been established, a large portion of the business is, however, still transacted by individual insurers designated “underwriters.” The underwriters of London form an influential society known as “Lloyd’s” (q.v.), from having originally met in a coffee-house kept by a person of that name in Abchurch lane; and their extensive business, numerous agents for procuring information, and general influence in the mercantile community, have long gained for them a world-wide reputation. As a small number of

risks, viewed in connection with the great hazard to which property at sea is exposed, would not secure a safe average to the individual insurer, he finds it prudent to take but a fractional part of the entire risk on himself, and this is done by subscribing or "underwriting" the stipulated proportion on a policy drawn out for the whole amount to be covered. The necessity for circulating the policy for this purpose, and otherwise negotiating the insurance, has given rise to another business, that of the "insurance broker," with which, however, that of the underwriter is often combined. A system of mutual insurance is frequently carried out by associations of ship-owners forming "clubs," by which ship-owners arrange for the mutual insurance of their vessels, or shares of vessels—the various claims arising from loss or accident being met by *pro rata* contributions from the members in proportion to the sums respectively insured by them. Under this system the commission of the ship-broker, although included in the premiums, is sayed by the owner.

Marine insurance differs from an ordinary fire insurance, in respect that in case of partial loss the underwriter pays only such a proportion of the sum insured as the damage sustained bears to its whole value at the time of insurance. See *AVERAGE*. In adjusting a partial loss, it is usual to deduct one-third of the nominal value, for new materials furnished to replace the older destroyed, and labor. Policies are of two kinds, "valued"—where the insurance is based on a specific bill of lading—and "open," where, in case of loss, the value of a ship with her stores is estimated as at the date of sailing, her freight at the amount she would have earned had the voyage terminated favorably, and her cargo at its invoice price, adding premium and all charges. The insurance is binding although the ship may have been lost when the policy was executed, but any warranty, if not true, is held to vitiate the insurance, even although the misstatement is not material to the risk. A stamp-duty, now reduced to a nominal rate, is levied upon all marine insurance policies. In fixing its amount, the choice lies with the insured of doing so with reference to the *term* of insurance (not exceeding one year), or per single voyage, as follows: By time—for any term not exceeding six months, 3d. per £100; exceeding six months, 6d. per £100. By voyage, 3d. per £100. The rates for marine insurance have been much increased within recent years, in consequence of the increased number of shipwrecks. For the five years 1861 to 1865 inclusive, the annual average reported was 1538; from 1866 to 1870, 1862; and from 1871 to 1876, 2,536. The increase is partly explained by the inclusion of minor casualties in the latter period.

INSURANCE, IN LAW.—The law on the subject of insurance is substantially the same throughout the United Kingdom.

Fire Insurance.—The contract is generally preceded by proposals, in which case the proposals and policy of insurance must be read together, if the policy refers to these proposals. In order to insure property, the insurer must have some interest in the property insured, for otherwise there would be an inducement to commit arson. But he need not be owner; it is enough that he be accountable for the goods, or hold a lien on them, as a carrier, wharfinger, or bailee. Thus, many carriers keep up a floating policy to cover all goods which may happen to be on their premises within a given period. In all these cases, the words of the policy are the important points; and good faith is required in giving a correct description of the goods or premises, for every statement or representation as to anything that is essential is taken to be a warranty. The premises must not be materially altered during the risk, otherwise the policy will be void; but often the policy stipulates that alterations may be made on giving notice. A person in lodgings may insure his goods, and may safely call the house his "dwelling-house" for that purpose. But, as a general rule, great care must be taken by the insured not to misrepresent anything material, and not to conceal any extraordinary risk which the insurer ought to know. If a fire happens, either on the premises, or in neighboring premises, the insurer cannot set up in defense that it was caused by the negligence of the insured or his servant, for these are generally the very things which an insurance is intended to guard against. When a fire happens, it is generally always provided by the policy that notice of the loss is to be sent in, and full particulars of the damage done, and the alleged value, for it is only the actual loss which is insured against, and that only can be recovered: Thus, if a person insures his house or furniture for £600, and damage only to the extent of £50 has been done by fire, he can only recover the £50, for otherwise he would be better off than he was before the fire, and the contract is one merely of indemnity—i.e., it does not add to one's wealth, but merely secures against loss. It is often provided that the annual payment of the premium on a contract of insurance may be paid within 15 days after the first or previous year has expired, but it is dangerous to allow the payment to be postponed so long, for if a fire happen in the interval, the insurer will not in general be liable. Sometimes the same property is insured in several offices, but in that case the insured party can nevertheless only recover the value of his loss once and no more. He can sue either of the insurers, however, for the amount, if each policy cover the whole value, and the party who pays can then recover a proportionate part from the other co-insurers, for they all divide the loss among them. In cases where carriers and others take out a floating policy of fire insurance, the carrier can sue for the full loss of the goods, though far exceeding the extent of his own interest in them, but in that case the owner of the goods destroyed is

entitled to recover the balance from the carrier, even though originally he never gave authority to the carrier to insure them. And so, in like manner, if a person is insured, and recovers his loss from the insurer, and then sues a third party for the wrong which caused the loss, the insurer gets the benefit of what may thus be recovered, in diminution of his own loss.

Life Insurance is not a contract of indemnity, like fire insurance, and therefore a person may insure his life in as many insurance offices as he pleases, and his executors will recover the full amount insured from each of the insurers, regardless of the rest. In order, however, to insure a life, the insurer must either himself be "the life" or must have a pecuniary interest in the life. Thus, a creditor is entitled to insure his debtor's life; a wife may insure her husband's or her own, as if she were unmarried; and he may insure the wife's, if she has an annuity or property settled upon her for life, in which he has an interest. It is enough, also, that the interest of the insurer exist at the time the policy is entered into, and hence, though the interest afterwards cease, he will still be entitled to recover the amount, if the policy is kept up. Thus, a creditor whose debt is satisfied, may still recover on the policy. In entering into contracts of life insurance, scrupulous good faith is exacted in the description of the nature of the life insured, and any fraudulent misrepresentation in a material point is fatal to the insurer's right to recover. Some companies even go the length of inserting in their policies a clause, that if any misrepresentation (i.e., however trifling) be made, the policy will be void. But particular care should be taken to avoid such offices, for the policies taken out on such terms will generally be so much waste paper, as far as any security is concerned. At the same time, it is often dangerous for the insurer to treat lightly any misrepresentation, for in the end the question, whether it is material or not, will be one not for him or his executors, but for a jury, in case an action is brought. When the policy is effected through an agent on the principal's life, and the agent, unconsciously and without the authority of the principal, makes a misrepresentation, this will bind the principal. Where the person whose life is insured commits suicide, or is hanged, the policy is void, unless, in the case of suicide, he was in a state of insanity at the time. The policy, however, frequently has an express provision on this subject, the terms of which will be in that case all-important, and will govern the liability. In case the policy provides, as it often does, for its continuance, if payment after the expiration of the year is made within 15 or 21 days, it is dangerous to run the risk of this interval, for if the party dies during the 15 days before the premium is paid, the policy will not be set up by his executors coming forward to pay within those days. But the policy sometimes expressly allows of this, in which case it will be competent for the executors to make the payment. Life assurances are often assigned in security of a debt, in which case the assignor generally covenants to pay the premiums, so as to keep the security up; and failing payment by the assignor, the assignee is generally authorized to pay them himself, and recover the amount from the assignor. Notice of an assignment of a life policy should always be given to the insurance company, so as to let them know whom they are to pay.

Maritime Insurance is effected either on a voyage from one port to another, in which case it is called a voyage policy, or it is from one given day to another, in which case it is called a time policy. When the value of the property insured is expressed in the policy, it is called a valued policy, and when not so expressed it is an open policy. In general, wagering or gaming policies are void by statute, and the insurer must have some interest in the ship, such as the profits of the voyage or the freight. The insurance of seamen's wages, however, is not competent, for it tends to take away the stimulus of exertion from the crew. When the policy states a fixed sum as the value of the property, and expressly provides that the policy shall be deemed sufficient proof of interest, the insurance is an insurance "interest or no interest," and void by the statute. When the policy is a voyage policy, there is an implied warranty by the insurer that the ship is seaworthy at the commencement of the voyage, but there is no such warranty in a time policy. As is the case in fire and life policies, any fraudulent concealment of material circumstances which increase the risk will void the policy. But everything done in the usual course of navigation and trade is presumed to have been foreseen, and in contemplation of both parties. The policy is understood to cover the risk, not only of the perils of the sea, properly so called, but of ignorance or negligence on the part of the master or mariners. But the loss caused by mere tear and wear is not covered by the policy; the cause of the loss must be something fortuitous or accidental. Every policy impliedly assumes that the vessel will proceed straightway to her place of destination, without unnecessary delay. But sometimes, from unforeseen causes, it is absolutely necessary for the master to deviate, in which case, and in which only, the policy will remain good, strict proof, however, being always given of this imperious necessity. When the ship has been so injured or deteriorated as to render it hopeless to restore it, and the repairs will cost more than the ship is worth, the assured may abandon the ship, and claim for a total loss. See **AVERAGE**.

INSURANCE (ante). *Fire Insurance.*—The processes in vogue in the United States are practically the same as in England, whence they are derived. In insurance

against loss by fire the governing principles are simple, and, except in cases termed "hazardous" and "extra-hazardous," are generally understood. As to these latter the provisions are purely arbitrary and as stipulated between the contracting parties, being based on the great variety of the influences which affect the character and extent of the risk. However, the degree of liability of insurers is to be liberally construed as regards the insured; and the accidental presence among insured property of articles rated hazardous or extra-hazardous, is not to be considered as vitiating a policy otherwise valid. And, on the same principle, the definition of "storing" certain classes of goods, is not contemplated as depriving the insured party of the right to shelter such goods for his own domestic use without additional premium. So, also, a description in a policy of a building insured is not to be deemed violated to the extent of affecting the insurance, on account of any relative alteration of location by reason of the acts of outside parties, as in the case of the erection of new buildings changing the condition described as isolation. Injury, or even destruction, without ignition, does not involve liability on the part of the insurer. It is the same with regard to the effect of lightning: there is no liability unless positive fire ensues. Explosion from gunpowder is rated as a loss, while that from steam is not. Even negligence on the part of the insured does not lessen the liability of the insurer, except where this affords suspicion of fraudulent design. And, also, a fire which results from insanity in the insured party is not accounted any defense of the insurer. Stipulations permitting the insurer to rebuild or repair, at his own option, are frequent incidents in the framing of policies. The general understanding of the law of insurance provides that, in the event of false representations on the part of the insured inducing the acceptance of a risk on terms which would not have been granted by the insurer on a truthful statement, the policy is vitiated. Such representations, or the conditions governing them, are termed material to the risk, and only such. The same rule applies also to concealment on the part of the insured: concealment through ignorance, or of facts not material to the risk, is not considered to impugn the validity of the policy.

The number of New York fire-insurance companies in 1879 was 59; the number doing a fire-marine business, 22; total, 81. The number of fire companies of other states reported in the same year was 42; of fire-marine, 21; total, 63. Of New York mutual fire-insurance companies there were 6; of mutual fire-insurance companies of other states, 1; of foreign fire-insurance companies, 20; of foreign fire-marine, 2. Grand total of American fire-insurance companies doing business in New York, 108; of foreign, 20; of American fire-marine companies, 43; of foreign, 2. Final total of fire and fire-marine insurance companies doing business in New York, 173. It is shown by the annual report of the superintendent of the insurance department of the state of New York, for the year ending Dec. 31, 1879, that the number of fire and fire-marine companies doing business in the state was 173; that their combined capital amounted to \$50,992,220; their gross assets were \$120,221,458.33; liabilities, \$33,899,357.21. The income of these companies for the year was \$45,951,247.66; expenditures, \$45,894,-816.95; net receipts over expenditures, \$56,430.71. The standing risks of the companies included averaged \$100 of insurance to \$2.15 of net assets; the average premium being 87 cents on every \$100 insured. Of the 173 companies considered, only 23 have had an existence dating back further than 1850, the three oldest being the Knickerbocker (1787), the Eagle (1803), and the Albany (1811). Of the remainder, 106 have been organized since 1860, 73 since 1870, and 52 between 1850 and 1860.—The great fire in Chicago, Oct. 8-10, 1871, causing a pecuniary loss of more than \$200,000,000, involved losses to the insurance companies amounting to \$96,533,721, all of which but \$6,000,000 was in United States companies. Of the companies involved, 57 were compelled to suspend. The loss by insurance companies after the great fire in Boston, Nov. 9, 1872, amounted to \$52,676,000, of which \$35,351,600 was borne by Massachusetts companies.

Marine Insurance includes in the category of losses covered by a policy those which may be occasioned by fire, barratry, piracy, theft, capture, arrest or detention—besides those caused by the action of the winds or waves, by sinking or grounding. An important principle obtains, permitting the insured to abandon the property in question, and declare a total loss, leaving the underwriter to make all that he can out of what remains in a damaged or otherwise unavailable condition. This abandonment, however, is allowed only when the partial loss exceeds 50 per cent of the value, and a provision of this character is usually inserted in the policy. In the United States there are two kinds of insurers—stock companies and mutual companies. In the first the profits are divided among the stockholders; in the second they accrue *pro rata* to the insured, or are applied to reduce the premiums paid. Marine insurance covers the ships, the cargo, the earnings for freight, and the profits upon the cargo. It is usual to place a valuation upon the ship, but the remaining losses become matters of proof. Illegality in the interest insured renders the contract void. Warranty is an important element in marine insurance, and is either express, which is made a part of the policy, or implied, as in the case of absolute seaworthiness at the time of insurance. Warranty covers the ownership, national character of the vessel, lawfulness of the cargo covered and the voyage, the taking of convoy, and the time of sailing. If the warranty be not justified the insurance does not attach. Implied warranty takes cognizance of misrepresentation, and also of concealment of material facts. It also requires that there

shall be no deviation from the course set down or implied, or from the stated destination. Such a change vitiates the insurance, and discharges the insurers from all subsequent risks. The illegality of a voyage or cargo discharges the insurer, not because of that fact, but because of its concealment, the law recognizing this as a risk not taken or implied in the contract. Insurance *from* a port begins on the actual departure of the vessel; insurance *at and from* a place begins when the destination named is reached by the vessel in good condition. A customary clause in insurance policies states that the insurance is in existence "until the ship be arrived and moored 24 hours in safety."—The number of New York marine insurance companies reported for 1879 was 7; other states, 1; foreign marine, U. S. branches, 8; total, 16, doing business in New York. The total assets of these companies was \$19,947,903.43; total income, \$8,042,498.50; total expenditures, \$6,024,005.99.

Life Insurance.—The germ of life insurance in the United States may be found in corporations chartered before the revolutionary war, one example of which was that organized in Philadelphia in 1769 for the benefit of the families of Episcopal clergymen, the rates and rules of which were suggested by Benjamin Franklin and his friend Richard Price of London. In the early part of the present century the Massachusetts Hospital Life insurance company and the New York Life and Trust company were chartered, but their plans were crude, and they failed to attract much attention. It was not until 1843-46 that the foundations of the business were fairly laid. During that period companies were formed in New York, Massachusetts, New Jersey, and Connecticut, the success of which soon led to the organization of many others; the public attention was gradually awakened to the advantages of this form of insurance, new companies were chartered on every hand, and the business, small at first, increased with great rapidity. Its gigantic development is indeed one of the marvels of the century. Its progress has been far more rapid than in England, France, or Germany. At first the subject was very imperfectly understood, the popular enthusiasm outrunning the popular intelligence. "There is no business scheme known among men," says the Massachusetts insurance commissioner, "in which exist so many pitfalls for honest ignorance, or lurking-places for designing fraud, as in that of life insurance." Honest mistakes both as to principles and methods have in some instances been followed by disastrous results, while there is every reason to believe that in many instances covetous men have taken advantage of "the lurking-places for designing fraud." It is stated on high authority that of the 200 life insurance companies organized in this country, more than 120 have failed or retired—all but 20 of them since 1862. Forty-two failed outright, 72 reinsured their risks, and the remainder closed their doors under various mutual arrangements. No less than 55 companies, for one reason or another, ceased doing business in New York between 1859 and 1879. Many of those which became insolvent are now in the hands of receivers, where some of them have lingered for years, "affording rare opportunity," says the present Massachusetts commissioner, "for the robbery of policy-holders by a class of professional shysters." The numerous failures that have occurred and the disasters attending them have led to a more careful study of the subject, and many mistakes and abuses, the inevitable results of empiricism or carelessness, have been corrected. The legislation upon the subject has been greatly improved. The companies are now required to make a complete disclosure of their receipts, assets, expenditures, and investments, and of their methods of doing business, and when one is found to be drifting upon the rocks, the law interposes for the protection of its policy-holders.

Life insurance companies are of two general classes, proprietary and mutual. A proprietary company is constituted of those who furnish the capital necessary to the pursuit of the business. Insurers, as such, have no voice in the management, and no participation in the profits. In a mutual company, on the contrary, every policy-holder is an insurer as well as insured. The policy-holders exercise control through their power in the election of managers, and are entitled to their relative share of the profits. There are also companies in which the proprietary and the mutual principle are to some extent blended, those who furnish the capital required in the beginning, and who assume responsibility for the first expenses and early losses, covenanting to divide among the insured either the whole or a part of the profits.

The rates of insurance are determined by a table of mortality, compiled from the results of observation and experience, and showing the percentage of deaths likely to occur in a single year among a certain number of persons of a given age. The table, in other words, shows the average rate of mortality in the community. According to the "American experience table," so called, of 100,000 persons 10 years of age, living at a certain date, it is assumed that 749 will die during the ensuing year; and this death-rate determines the risk assumed by the company, and, in connection with other circumstances, the amount of the premium to be paid by the insured. From this point the calculation proceeds year by year, for 85 years, when it is assumed that of the whole 100,000 persons only 3 will be living. The table shows the death-rate in every year between the two extremes of 10 and 95. In fixing these rates of mortality no account is taken of health or disease, or of strong or weak constitutions. But as the companies are careful to insure only those who are certified by medical authority to be in sound health, the rate of mortality among the policy-holders must be far below that shown in

the table; a circumstance which, as any one may see, inures greatly to the advantage of the companies, whether fairly or not is a question for consideration. Certainly the rates of insurance are considerably higher than they would be if the calculation were made, not upon the general rate of mortality in the community as a whole, but upon that of a select number of persons certified by medical authority to be in exceptionally sound health. It is the usual practice of the proprietary companies to allow the policy-holders interest on the amount of their premiums at $4\frac{1}{2}$ per cent; the mutual companies generally allow 4 per cent. Of course the profits of the companies are largely drawn from the higher rate of interest at which they are able to invest the money received from their customers. In this respect their practice is the same as that of the savings banks, and few will doubt that it is legitimate and fair.

In the beginning there was no governmental supervision of the business of the companies, and they were allowed without restriction to confiscate to their own use the funds derived from policies that had lapsed, whether from accident or inability to meet an accruing payment. The periodical premium, by the conditions of the policy, was due on a certain day, and if it were not paid, the insurance was forfeited. The number of such cases was of course very great, especially in times of business depression, multitudes finding it impracticable to raise the money necessary to keep their policies alive. Within a few years the legislatures of some of the states—notably those of Massachusetts and New York—have interposed for the protection of policy-holders thus situated. The New York statute, passed May 21, 1879, declares that “whenever any policy of life insurance hereafter issued by any company organized or incorporated under the laws of this state, after being in force three full years, shall by its terms lapse or become forfeited for the non-payment of any premium, or of any note given for a premium, or loan made in cash on the policy as security, or if any interest on such note or loan, unless the provisions of this act are specially waived in the application, and notice of such waiver written or printed in red ink on the margin of the face of the policy when issued, the reserve on such policy, including dividend additions, calculated at the date of the failure to make any of the payments above described, according to the American experience table of mortality, and with interest at the rate of $4\frac{1}{2}$ per cent per annum, after deducting any indebtedness of the insured on account of any annual, semi-annual, or quarterly premium then due, and any loan made in cash on such policy, evidence of which is acknowledged by the insured in writing, shall, on demand made, with surrender of the policy within six months after such lapse, be taken as a single premium of life insurance at the published rates of the company at the time the policy was issued, and shall be applied, as shall have been agreed in the application and policy, either to continue the insurance of the policy in force at its full amount, so long as such single premium will purchase temporary insurance for that amount, at the age of the insured at the time of lapse, or to purchase upon the same life, at the same age, paid-up insurance payable at the same time, and under the same conditions, except as to payment of premiums, as the original policy.” It is also provided that “if the reserve upon any endowment policy, applied as a single premium of temporary insurance, be more than sufficient to continue the insurance to the end of the endowment term named in the policy, and if the insured survive that term, the excess shall be paid in cash at the end of such term, on the conditions on which the original policy was issued.”

Policies of life insurance are of various kinds, and they may be still farther varied by the addition of new or the suppression of old conditions, as the law permits. A whole-life policy is one in which the company binds itself to pay the representatives of the insured a certain amount of money at the end of the year in which he may die. The net premium for such a policy, the amount thereof being equitably fixed in view of all the elements entering into the case, may be paid wholly in advance or in annual or less frequent installments, as the parties may agree. A term-policy is one in which the company pledges itself to pay the representatives of the insured a certain sum of money at the end of the year in which he may die, provided his death occur within a certain number of years named in the policy. An endowment-policy is one in which the company promises to pay a fixed amount to the insured himself at a certain future time if he should then be alive. The premium may be paid wholly in advance, or at stated intervals, as the parties may agree. Children's endowment-policies are promises to pay, on a child's attaining the age of 18, 21, or 25 years, a specific amount. If the child die before the time named, the premiums paid will be returned or retained, according to the agreement of the parties as expressed in the policy. An endowment-insurance-policy combines the conditions of a pure endowment-policy with those of a term-policy, the company agreeing to pay a certain sum of money at a certain future time in case the person whose life is insured should then be alive, or at his death, if that should happen before the time agreed upon. A joint-life policy is one in which the company binds itself to pay a certain sum at the death of one or two or more persons named, on the joint continuance of whose lives insurance is made. Although there are still other varieties of policy, those above explained are the most important and fundamental.

In all cases where the continuance of the life of the insured is of pecuniary value to the company, the former is by the policy placed under certain conditions, a violation of which works forfeiture to the latter of the policy and of all sums that may have been

paid thereon. These conditions forbid the insured to travel in regions where human life is exposed to peculiar dangers, or to engage in certain hazardous occupations, or to take his own life. He is moreover bound to maintain the accuracy and truthfulness of all the declarations made in his application for insurance, any proved misrepresentation on his part working forfeiture. Suicide will not work a forfeiture if it be proved that the act was committed when the reasoning faculties of the insured were "so far impaired that he was not able to understand the moral character, the general nature, or the consequences and effect" of the same, or that he was "impelled thereto by an insane impulse which he had not power to resist." As to restrictions upon travel, residence, or occupation, they may be waived in any case under a written consent of the company. Policies are often surrendered after a certain number of payments have been made, the company paying therefor what is called the surrender value, which of course is generally a small sum compared with the aggregate of the premiums paid thereon. In some of the states the companies authorized to transact business therein are permitted to make a special deposit with the insurance department for the protection of policies duly registered in books kept by the department for that purpose, the state making itself responsible for the safe-keeping of such securities, which must always be kept equal to the value of the policies thus registered.

There are no statistics at hand which make a complete and accurate disclosure of the amount of business transacted by the life insurance companies of this country; but the following facts gathered from the last report of the New York superintendent indicate the vast extent of the business. The number of life insurance companies chartered by the state and doing business there in 1879 was 12; the number of companies chartered by other states and doing business there, 19—total 31. Number of policies in force in these companies in 1879, 595,486; total amount insured by these policies, \$1,439,961,265; total assets of these companies, \$401,515,793; gross liabilities, excepting capital, \$336,-238,071; surplus as regards policy-holders, \$65,277,721; total amount of premiums, \$52,721,720; total income, \$76,174,954; excess of income over expenses, \$9,996,387; total number of policies issued in 1879, 67,399, amounting to \$167,865,390; policies terminated during the year, 67,661, amounting to \$176,606,626; policies terminated by death, 7,359, amounting to \$20,284,347; policies terminated by maturity, 4,804, amounting to \$9,043,849; policies terminated by surrender, 18,224, amounting to \$54,257,436. The figures from the last report of the insurance commissioner of Massachusetts are not less striking:—Number of policies issued in 1879 by the 30 companies doing business there, 66,388, amounting to \$165,802,173; number terminated during the year, 66,033, amounting to \$173,085,374; policies in force, 588,757; amounting to \$1,427,178,306; claims by death in 1879, 7,273, amounting to \$20,010,078; gross income of the companies, \$75,509,926; gross expenditures, \$66,734,530; gross assets, \$401,172,216; gross liabilities, \$362,734,965; surplus as regards policy-holders, \$43,119,151; net present value of policies or computed premium reserve, \$349,488,935. The policies are thus classified: Life-policies, 461,888, amounting to \$1,185,338,649, with a reserve of \$256,418,927. Endowment-policies, 109,361, amounting to \$202,704,494, with a reserve of \$90,123,671. All other policies, 17,508, amounting to \$39,135,163, with a reserve of \$3,534,006. Total reserve, \$350,076,604. These figures do not represent the complete aggregate of the business of life insurance in the United States. It is believed that the whole number of lives insured is not less than 1,100,000, while the aggregate sum insured is fully \$2,705,000,000—a sum amounting to one-twelfth of the entire capital wealth of the union. "There are in the country," says one authority, "more than half a million families who have voluntarily subjected themselves to a tax amounting in the aggregate to about \$100,000,000 a year, and are under bonds, more or less, in the aggregate amount of about \$400,000,000 to continue to pay this tax for life or for a longer period." These statements serve to show the enormous bulk of the business, and at the same time suggest to the political economist some problems of the highest importance to the public welfare, in respect to which great differences of opinion are known to exist.

Accident Insurance.—The system of insuring travelers and others against accident is of recent institution, as is that of the insurance of live-stock, plate-glass, and other fragile articles, and of steam-boilers against explosions. Accident insurance companies have become an important and popular institution in the United States, one such having paid nearly \$4,000,000, during 15 years of its existence, in indemnity for injuries and death losses. Of these companies there are but two in the United States, and five or six in England, the latter being about 35 years old, and the American companies 17; the English companies, however, have far fewer insurers than those in the United States.

INTAGLIO (Ital. "cutting in"), a term in art, the opposite of relief (see ALTO-RILIEVO), means the representation of a subject by hollowing it out in a gem, or other substance; so that an impression taken from the engraving presents the appearance of a bas-relief.

INTEGRAL CALCULUS. See CALCULUS.

INTEGRATION. See CALCULUS.

INTELLECT, the name for the thinking portion of our mental constitution. Mind contains three elementary constituents—emotion or feeling, volition or the will, and

intelligence or thought. See **EMOTION, WILL.** The intellectual powers are explained in part by their contrast with feeling and will. When we enjoy pleasure or suffer pain, we are said to feel; when we act to procure the one or avoid the other, we put forth voluntary energy; when we remember, compare, reason, our intelligence is exerted.

The powers of the intellect have been variously classified. Among the commonly recognized designations for them, we may mention memory, reason, and imagination, which imply three very distinct applications of our mental forces. Reid classified them as follows: Perception by the senses, memory, conception, abstraction, judgment, reasoning. Stewart added consciousness, to denote the power of recognizing our mental states, as sensation and perception make us cognizant of the outer world; likewise attention (a purely voluntary function, although exerted in the domain of intelligence), imagination, and the association of ideas.

It might be easily shown that in such a classification as the above there is no fundamental distinctness of function, although there may be some differences in the direction given to the powers. There is not a faculty of memory which is all memory, and nothing but memory. Reason and imagination equally involve processes of recollection. And with regard to the association of ideas, it has been shown by Mr. Samuel Bailey (*Letters on the Human Mind*) that if this is to be introduced into the explanation of the intellect, it must supersede the other faculties entirely; in short, we must proceed either by faculties (as memory, reason, etc.), or by association, but not by both.

In endeavoring to arrive at a satisfactory account of the human intellect, we must make a deeper analysis than is implied in the foregoing designations. We find at least three facts, or properties, which appear in the present state of our knowledge to be fundamental and distinct, no one in any degree implying the rest, while taken together they are considered sufficient to explain all the operations of intelligence, strictly so called.

1. **DISCRIMINATION**, or the consciousness of difference. When we are affected by the difference of two tastes or odors, or sounds or colors—this is neither mere feeling nor volition, but an intelligent act, the foundation of all other exercises of our intelligence. We must recognize the impressions on our senses as differing, before we can be said to have the impression of anything; and the greater our powers of discrimination in any department, as color, for example, the more intellectual are we in that special region. We could have no memory if we did not first recognize distinctness of character in the objects that act on the senses, and in the feelings that we experience. In some of the senses, discrimination is more delicate than in others; thus, sight and hearing give us a greater variety of impressions than taste or smell, and are therefore to that extent more intellectual in their nature. In the course of our education, we learn to discriminate many things that we confounded at first. Every craft involves acquired powers of discrimination as well as habits of manipulation. A man is in one respect clever or stupid, according as his perceptions of difference in a given walk are delicate or blunt.

2. The next great intellectual property is **RETENTIVENESS**, or the property whereby impressions once made persist after the fact, and can be afterwards recovered without the original cause, and by mental forces alone. When the ear is struck by a sonorous wave, we have a sensation of sound, and the mental excitement does not die away because the sound ceases; there is a certain continuing effect, generally, although not always, much feebler than the actual sensation. Nor is this the whole. After the sensation has completely vanished, and been overlaid by many other states of mind, it is possible to evoke the idea of it by inward or mental links, showing that some abiding trace had been left in the mental system. The means of operating this revival is to be found in the so-called forces of association. See **ASSOCIATION OF IDEAS**.

3. The last great fundamental fact of intellect is agreement or **SIMILARITY**. See **ASSOCIATION OF IDEAS**.

It is believed that these three properties, in combination with the other two powers of the mind (feeling and volition or will), are adequate to explain all the recognized intellectual faculties or processes—memory, reason, imagination, etc. Memory is almost a pure case of retentiveness, or contiguity, aided occasionally by similarity. Perception by the senses is only another name for discrimination, the basis of all characteristic mental appreciation of matter or mind. Judgment is either discrimination or similarity, according as it discovers difference or agreement in the things judged of.

Sir W. Hamilton, in departing from the common classifications of the intellect, adopted the following division into six faculties or powers: 1. The *presentative* faculty, by which he meant the power of recognizing the various aspects of the world without and the mind within, called in the one case external perception; in the other, self consciousness, and sometimes reflection. 2. The *conservative* faculty, or memory proper, meaning the power of storing up impressions, to be afterwards reproduced as occasion requires. 3. The *reproductive* faculty, or the means of calling the dormant impressions up into consciousness again. These means are, as stated above, the associating principles. 4. The *representative* faculty, for which imagination is another name, which determines the greater or less vividness of the impressions or ideas thus reproduced. 5. The *elaborative* faculty, or the power of comparison, by which classification, general-

ization, abstraction, and reasoning are performed. This, in fact, is one (not the only) application of the general power of similarity. Lastly, 6. The *regulative* faculty, or the cognition of the *à priori* or supposed instinctive notions of the intellect, as space, time, causation, necessary truths, etc. This corresponds to what in German philosophy is called the "reason," as contrasted with "understanding," which deals with experienced or contingent truth.

On examining the above distribution, it will appear that while the first faculty, the presentative, coincides with the primary fact of discrimination, the three subsequent—conservation, reproduction, representation—are merely modes or distinct aspects of retentiveness. All the three must concur in every case of the effective retention or recollection of anything. The last power, the regulative, is of course disputed by the opposite school, who refuse to recognize a primary or distinct faculty as giving birth to the ideas in question. See CONSCIOUSNESS, CAUSE.

INTEMPERANCE. See INTOXICATION.

INTENDANT, or **INTENDANT MILITAIRE**, an officer in the French army charged with the organization and direction of all the civil services attending a force in the field. The officers acting under his orders are those in charge of all the finance services, the provisions, stores, hospitals, artillery train, and transport departments, besides the interpreters, guides, and such like temporary services. The *intendant-en-chef* of an army is the representative of the minister of war; and, short of superseding the general's orders, can exercise, in case of need, all the functions of that high officer of state. The intendance is divided into intendants, ranking with general officers, sub-intendants with cols., and assistant-intendants with majs.; besides cadets, who receive no pay, and constitute a probationary grade.

Intendant was the name given in France before the revolution to the overseer of a province. Such permanent officers were first appointed by Henry II. (1551). Under the complete system of centralization established by Richelieu, these intendants, as they were now called, became the mere organs of the royal minister, to the exclusion of all provincial action. To them belonged the proportioning of assessments, the levying of soldiers, etc. The national assembly, in 1789, established in each department an elective administration. Napoleon virtually restored the intendants, but exchanged the hated name for that of *prefects* (q.v.).

INTERAMNA. See TERNI.

INTERCALARY (Lat. *intercalaris*, for insertion), an epithet applied to those months or days which were occasionally inserted in the calendar, to make it correspond with the solar year. See CALENDAR.

INTERCESSION, DOCTRINE OF. Scripture, in many places, represents Christ, after having finished his redemptive work on earth, and ascended into his state of glory and exaltation, as ever pleading with God on behalf of those whom he has redeemed by the shedding of his blood (Rom. viii. 34; Heb. vii. 25; 1 John ii. 1). Theologians say, however, that we are not to suppose that God needs to be interceded with, as if he were still reluctant to forgive men, or that Christ's intercession makes him more merciful than before. They tell us, that since it is evident from the whole tenor of the New Testament, as well as from a multitude of special passages, that the penal sacrifice of Christ on Calvary reconciled God to man, we must regard the intercessory work of Christ rather as serving to illustrate the eternal holiness of God and the changeless love of the Savior, and as intended to keep continually in view the sacrifice of atonement on which it is founded. The doctrine of the intercession of Christ is held both by Protestants and Roman Catholics; but the latter, in addition, believe in the efficacy of the intercession of the Virgin and the saints, who, however, do not directly intercede for men with God, but with the Savior, the sinless One, who alone has the ear of the King of the universe.

INTERCOLUMNIACTION, in classic architecture, the distance between the columns of a building, measured at the bottom of the shaft. The intercolumniation varies in different examples, but the most favorite distance for the columns to be placed apart is $2\frac{1}{2}$ diameters of the column, which by Vitruvius is called *eustyle*. The central intercolumniation of a colonnade is frequently made wider than the others when required for access to a gate or door. In Doric architecture the intercolumniation is decided by the spacing of the triglyphs, the columns being usually placed under the center of every other triglyph.

INTERCOMMUNING, LETTERS OF. was an ancient writ issued by the Scotch privy council, warning persons not to harbor rebels.

INTERDICT, an ecclesiastical censure or penalty in the Roman Catholic church, consisting in the withdrawal of the administration of certain sacraments, of the celebration of public worship, and of the solemn burial-service. Interdicts are of three kinds—*local*, which affect a particular place, and thus comprehend all, without dis-

tinction, who reside therem; *personal*, which only affect a person or persons, and which reach this person or persons, and these alone, no matter where found; and *mixed*, which affect both a place and its inhabitants, so that the latter would be bound by the interdict even outside of its purely local limits. The principle on which this ecclesiastical penalty is founded may be traced in the early discipline of public penance, by which penitents were for a time debarred from the sacraments, and from the privilege of presence at the celebration of the eucharist; but it was only in the mediaeval period that, owing to circumstances elsewhere explained (see EXCOMMUNICATIO), it came into use as an ordinary church censure in the then frequent conflicts of the ecclesiastical and civil power. It was designed to awaken the national conscience to the nature of the crime, by including all alike in the penalty with which it was visited. The most remarkable interdicts are those laid upon Scotland in 1180 by Alexander III.; on Poland by Gregory VII., on occasion of the murder of Stanislaus at the altar; by Innocent III. on France, under Philippe Auguste, in 1200; and on England under John in 1209. The description of England under the last-named interdict, as detailed by some of the contemporary chroniclers, presents a strangely striking picture of the condition of the public mind, which it is difficult with our modern ideas fully to realize or to understand. It would be a great mistake, however, to suppose that during the continuance of an interdict the people were *entirely* destitute of spiritual assistance. The interdict mainly regarded the *solemnities* of public worship; it was permitted to administer baptism, confirmation, and the eucharist in all cases of urgency; to confess and absolve all who were not personally the guilty participants in the crime which the interdict was meant to punish; to celebrate marriage, but without the solemnities; and to confer orders in cases of necessity. And under the popes, Gregory IX., Innocent III. and IV., and Boniface VIII., still further mitigations of its rigor were introduced, one of which was the removal of the interdict and restoration of public worship on certain great festivals, especially Christmas, Easter, Pentecost, Assumption, and All Souls. The council of Basel enacted very stringent rules as to the use of this penalty, and in later times the general interdict has been entirely disused, although occasionally, in very special circumstances, and to mark the horror of the church for some enormous crime, instances are still recorded in which a particular place or church has been visited with the penalty of a local interdict.

INTERDICT, in Scotch law, is an order issued by the court of session to stop or prohibit a person from doing an illegal or wrongful act. It is obtained on presenting a note of suspension and interdict to the lord ordinary on the bills. The party applying for it must have both title and interest—that is, he must be more than a mere stranger. The principles on which it is granted in Scotland are substantially the same as those in which the parallel writ of injunction (q.v.) is granted by the court of chancery in England.

INTERDICTION is a process peculiar to the law of Scotland, by which persons of imbecile minds may either restrain themselves, if conscious of their weakness—then called voluntary interdiction—or may be restrained by the court of session *in invitum*, then called judicial interdiction. The effect of both is to appoint trustees or interdictors, whose consent is necessary to all deeds whereby the imbecile's heritable estate is alienated. See IMBECILITY.

INTERESSE TERMINI, a term sometimes used in English law to denote the kind of interest which a lessee takes in land when the lease is executed. It amounts to a right of entry on the lands, which is assignable.

INTEREST, the payment due by the borrower of a sum of money to the lender for its use. The interest of £100 for one year is called the rate *per cent*; the money lent, the principal; and the sum of any principal and its interest, the amount. The current or market rate of interest fluctuates widely, by reason, not, as is often supposed, of the extent of the supply of money, but of the variable rates of profit, as in Holland, where it has always been comparatively low, and in our own time in Australia and California, where mercantile profits being in excess, the rate of interest is relatively high.

A strong prejudice against exacting interest existed in early times, arising from a mistaken view of some enactments of the Mosaic law;* and as late as the reign of Edward VI. there was a prohibitory act passed for the alleged reason that "the charging of interest was a vice most odious and detestable, and contrary to the word of God." Calvin, the famous reformer, was one of the first to expose the error and impolicy of this view, although a series of enactments, known as the usury laws, to some extent perpetuated it, by an attempted restriction of the maximum rate to be paid. In England this rate was fixed by act 21 James I. at 8 per cent. During the commonwealth it was reduced to 6 per cent; and by the act 12 Anne, c. 16, to 5 per cent, at which rate it stood till 1839, when the law was repealed. In Scotland any charge for interest was prohibited before the reformation. In 1587 the rate was fixed by law at 10 per cent;

* See Exodus, xxii. 25; Leviticus, xxv. 39; Deuteronomy, xxiv. 19: the application being to money lent for the relief of distress, and not advanced to the borrower that he might improve it.

in 1633 at 8 per cent; in 1661 at 6 per cent; and by the act of Anne, as above noted, at 5 per cent. It is now admitted that the operation of such laws tended only to raise the real rate of interest, by driving men in distress to adopt extravagant methods of raising money—the bonuses thus paid being really and in effect an addition to the nominal interest.

Interest is computed on either of two principles: 1. Simple interest, where, should the interest not be paid as due, no interest is charged upon the arrears. Although this mode of reckoning has little to recommend it in reason, it is adopted in many transactions, and receives the sanction of the law. The computation of simple interest is easy, it being only necessary to calculate the product of the principal, the rate per cent, and the period in years and fractions of a year, the result, divided by 100, giving the sum required. Thus, wanted the interest of £356 6s. 8d. for 3½ years at 4 per cent.

$$356\frac{1}{2} \times 3\frac{1}{2} \times 4 \div 100 = £49 17s. 9d.$$

2. Compound interest is the charge made where—the interest not being paid when due—it is added to the principal, forming the amount upon which the subsequent year's interest is computed. The rules for most readily making computations by compound interest can only be effectively expressed algebraically, and, using the symbols in article **DISCOUNT**, we annex a few of the elementary formulae.

1. Since £1, increased by its interest r , at the end of one year becomes $1 + r$, this amount at the end of the second year becomes $(1 + r)^2$, and generally at the end of the n^{th} year $(1 + r)^n$. Example: To find the amount of £1, improved at 5 per cent for six years. r , the interest for £1, is .05, and $n = 6$; therefore $(1.05)^6 = 1.34$, or £1 6s. 9½d.

2. Since £1 becomes in one year $1 + r$, it is found by ordinary proportion that the fraction of £1 which will amount to £1 in a year is $(1 + r)^{-1}$ (i.e., $\frac{1}{1+r}$) = v ; and reasoning

as above, the sum which will amount to £1 n years hence is $(1 + r)^{-n} = v^n$. 3. The amount of £1 in n years being $(1 + r)^n$, it will be seen that the excess of this sum over the original £1 invested, or $(1 + r)^n - 1$, is the amount of an annual increment or "annuity" of £ r for the period, and from this, by proportion, is deduced the formula for the amount of an annuity of £1 for the same time, being

$$\frac{1}{r}(1 + r)^n - 1.$$

4. Reasoning as in (3), the present value of an annuity certain of £1 for n years, or the sum which, improved at interest, will meet the annuity is

$$\frac{1}{r} \left[1 - \frac{1}{(1 + r)^n} \right] = \frac{1 - v^n}{r}$$

Tables for the four classes of values above described, based on various rates of interest, are given in most works on annuities. Those by Mr. Rance are computed for each quarter per cent from ¼ to 10 per cent. It may be useful to note two results that can be easily deduced from a table of the present values of annuities (4). 1. The annuity which £1 will purchase for any number of years is the reciprocal of the corresponding value in such a table. Example: A person borrows £100, to be repaid by annuity in 15 years, with interest at 5 per cent; required the annuity? The present value of an annuity of £1 per annum for that period, at the rate stated, is £10.38, and $100 \times 10.38^{-1} = 9.6342 = £9 12s. 8\frac{1}{4}d.$ 2. To find the annuity which in a given period will amount to £1—subtract from the annuity that £1 will purchase, ascertained as above, r , the interest of £1 for a year. Example: The annuity which, paid for 15 years, will amount to £1, taking interest at 5 per cent, is—

Value of annuity which £1 will purchase as last found.....	£.096342
Subtract r , at 5 per cent.....	.050000

Annuity required.....	£.046342
Or £4 12s. 8½d. will amount in 15 years to £100.	

INTEREST, IN LAW.—In England and Ireland, when a debt has been for some time due, there is no obligation imposed on the debtor by the common law to pay any interest whatever, though the sum has been fixed and often demanded. The creditor can always sue for his debt, which is his proper remedy, but he derives no benefit from giving time to his debtor. Therefore, if interest is to be paid, this must be, as a general rule, by virtue of express agreement. Nevertheless, there has always been one or two exceptions to this rule. Thus, by the usage of merchants, it has always been usual, when an action has been brought to recover the amount of a bill of exchange or promissory-note, for the jury to add interest from the time it was due; but even this was not a matter of course—it was a matter of discretion for the jury, and was generally withheld when there was delay in bringing the action. Another exception existed in the case of money due upon an award by an arbitrator, in which case interest is due from the day when the award was made. A third exception was in the case of a bond for money, in which case interest was added from the day it ought to have been paid. And lastly, if a surety had to pay

money for his principal, he could recover it back with interest. In all other cases, if there was no express agreement about interest, none could be claimed. If, however, there was a course of dealing between the parties, or a usage affecting a particular trade to give interest, then, without express agreement, this was understood. A recent statute somewhat amended the above defect of the common law, for by 3 and 4 Will. IV. c. 42, s. 28, a jury may now add interest at the ordinary rate on all debts or sums certain, which are made payable under some written instrument at a certain time; and even if not due under a written instrument, then if a written demand has been made, expressly giving notice that interest will be charged from and after the date of the demand, if not paid then, interest will also be due. But even in these last cases it is discretionary in the jury to give the interest, and therefore it is not claimable as a matter of course. As regards compound interest, it is *à fortiori* not claimable in any case, except where it has been expressly stipulated for, or where there is in some particular trade a definite custom to pay interest, and such custom must always be proved.

It ought also to be added that the court of chancery has always been in the habit of charging trustees who have misappropriated funds with 5 per cent interest on the amount, and also compound interest; but in simple cases of retaining moneys in hand without investing them, they have been charged 4 per cent. Formerly it was prohibited by statute in England to lend money on the security of real estate at a higher rate than 5 per cent; but these statutes have been abolished, and now any person may borrow or lend at whatever rate of interest he can agree with the other party. Pawnbrokers are allowed to charge interest not exceeding a fixed sum. See PAWNBROKING.

In Scotland the law has always been much more liberal in allowing interest to be claimed on outstanding debts, for there the converse principle was acted on, that on nearly all debts whatever, interest was claimable either by statute or by common law. Thus, interest is due on bills of exchange, on the amount contained in a horning or charge to pay, on sums paid by cautioners, on the price of lands sold, on money advanced at request, on the price of goods sold, if the usual time of credit has expired, and generally on all debts which there has been delay in paying.

INTEREST (*ante*) is founded upon the principle that, as capital is the fruit of labor, its possessor is therefore entitled to compensation for its use. A general denial of this, by destroying one of the most powerful motives to industry, enterprise, frugality, and foresight, would, it is now generally believed, hinder the advancement of the human race in knowledge and virtue, if indeed it did not give it a direct impulse toward barbarism. It is the belief of the most enlightened political economists of the present day that much of the legislation upon this subject, intended as it has been to protect the poor from the assumed rapacity of the rich, has nevertheless been in reality a mistaken and injurious kindness—an attempt to regulate by law that which might better be left to the discretion of the parties directly concerned. The interests of capital and labor are not conflicting but identical, and any legislation resting upon a contrary assumption is now seen to be injurious alike to both. The opprobrium cast, in the name of Christianity, upon the money-lender in the early centuries of our era, originated unquestionably in motives of benevolence; but it is now seen to have been founded in ignorance of the divine law of political economy. The money-lender may indeed abuse his power to the injury of the borrower, as the borrower may sometimes deceive the lender, but this is only the abuse of a thing not bad in itself. It was the growth of commercial enterprise under the influence of the Protestant reformation that first effectually undermined the ancient doctrines upon this subject; and the economists of the school of Locke, Hume, Adam Smith, and finally of Jeremy Bentham, did much to set the truth in a clear light. More and more the legislation of the world in respect to this subject is advancing toward an unreserved recognition of the principle that the rights of capital and labor rest upon one and the same foundation, and that the money-lender is not, any more than the money-borrower, necessarily a wrong-doer. In England, as long ago as 1854, all laws intended to prevent the taking of higher than legal rates of interest were repealed, borrowers and lenders being left free to make such agreements as might be mutually satisfactory. Some of the American states have, within a few years, followed the example of England, and the tendency of public sentiment in the United States is believed to be in the same direction. The generally prevailing rate of interest in the United States is 6 per cent, though in some of the states it is higher. In some states a particular rate is declared applicable to ordinary transactions where there is no specific agreement, but the parties are at liberty to stipulate for any rate that to them may seem good; if no rate be mentioned the legal rate is understood to be implied. No agreement to pay a higher than the legal rate can be enforced, unless such agreement is expressly authorized by statute, the established presumption of the law, in the absence of such legislation, being that such a rate is usurious. If there is a stipulation to pay a higher than the so-called legal rate of interest to the time of the maturity of the obligation, and nothing is said of the rate to be charged after that period in case of default, the weight of authority favors the conclusion that thenceforth the interest must be reckoned at the statutory rate. Sometimes an obligation to pay interest arises from well-established usage when there is no written contract to that effect; as where a debt is due upon account, and it is the general custom, within the knowledge of the debtor, to charge interest upon such claims after a certain time. Again, interest is

recoverable as damages for failure to pay a debt or claim at the time it becomes due, though there be no contract to that effect, such interest being reckoned at the legal rate from the time when the debt should have been paid. For example: suppose a note of hand, without interest, to be due upon a certain day; if there be default of payment at the appointed time, the courts will award interest from that date until the note is paid. If judgment have been obtained for a debt, interest on the same is reckoned at the legal rate from the day the judgment was rendered. The common law upon this point has in this country generally been reversed. Upon unliquidated demands—i.e., demands, the amount of which, and the date when payment is due, have not been precisely fixed—interest is not collectible. If a man convert to his own use the personal property of another, interest upon the value of such property accrues from the time of its conversion. The custodians of trust funds and trustees of every sort will be required to pay interest in cases of maladministration of the sums intrusted to them. If a guardian or executor fail in his duty to account for or invest the trust-funds in his possession within a reasonable time, he is liable to pay interest thereon as damages for his delinquency, and, if the case be flagrant, compound interest may be charged. In ordinary transactions compound interest is not favorably regarded by the courts and is seldom enforced. Even a special agreement to pay interest at the compound rate will generally be treated as not binding. An obligation to pay compound interest may, however, arise from the usages of trade, and in such cases courts will exact payment. In the case of foreign contracts interest will be allowed at the legal rate of the place where the contract is to be performed. Specific legacies draw interest from the testator's death, but on general legacies, payable at a particular day, interest is not allowed till that day arrives.

INTERFERENCE, a term employed to express the effect which rays of light, after being bent or diffracted, produce on each other. If the rays meet after diffraction, their light, when allowed to fall on a surface, will be divided into bars or stripes, alternately light and dark, as is shown in the article diffraction (q.v.). This phenomenon has been made the touchstone of the two rival theories of light, the *undulatory* and the *emission*. According to the former, it is thus explained: If two luminous waves simultaneously impel a molecule of ether, its motion will be the resultant of the original impulses; and if the two motions (as in the case of diffraction) be nearly in the same direction, the resultant will be nearly their sum; if opposite, their difference. Thus, when a particle has begun to undulate from the action of a luminous wave, and if, while in motion, another wave impinge upon it, the result will be increase of light, if the motion of the second wave conspire with that of the first; but a decrease, if they oppose each other; and total darkness, if, while opposing, they are equal in velocity. Let d be the distance corresponding to a complete period of vibration; then, if the second wave impinge upon the molecule after it has accomplished one or more whole vibrations corresponding to the distances d , $2d$, $3d$, etc., and has returned to its original position, the two waves will evidently conspire together, and produce more violent motion; but if it impinge on the molecule, when the latter has only accomplished half a vibration, corresponding to distances $\frac{1}{2}d$, $\frac{3}{2}d$, $\frac{5}{2}d$, etc., then the wave will oppose the particle's return to its original position; thus producing diminution of motion, or, if equal, rest. In the former case, the intensity of light is increased; in the latter, diminished; and if the undulations are of equal velocity, the light is doubled in the first case, and destroyed in the second. The emission theory totally fails to explain interference. In light of different colors, the value of d differs for each color, being least for violet, and greatest for red light. The principle of interference accounts in the most satisfactory way for the colors of thin plates, the fringes that accompany shadows, etc.; and its explanation forms the most decisive reason yet known for adopting the *undulatory* in preference to the *emission* theory of light. See LIGHT.

INTERJECTIONS are exclamations expressive not so much of a thought as of an emotion—as, ah! alas! hurrah! pooh! They are, therefore, hardly parts of speech, and never form part of a sentence. They are, in fact, more akin to the sounds emitted by the lower animals than to articulate language.

INTERIM, in the history of the reformation, the name given to certain edicts of the German emperor for the regulation of religious and ecclesiastical matters “in the meantime” (Lat. *interim*), till they could be decided by a general council. The first is the *Ratisbon interim*, the result of the deliberations of a commission appointed during the diet of Ratisbon (Regensburg) in 1541, of which Eck, Pflug, and Gropper were the Roman Catholic, and Melanchthon, Bucer, and Pistorius the Protestant members. On the greater number of doctrinal points the commission found it possible to agree on terms which might be deemed consistent with the views of both parties; but as to the sacraments and the power of the church, the differences were irreconcilable. By the Protestants in general, the whole movement was looked on as a scheme to entrap them into a formal return to the church of Rome. At the next diet, at Augsburg in 1548, a new interim was by the emperor's command prepared by Pflug, Helling (Sidonius), and Agricola. It is called the *Augsburg interim*. In it the use of the cup by the laity, the marriage of priests, and some other minor things, were conceded to the Protestants; but it met with very general opposition, particularly in the n. of Germany, and was revoked in 1552. By the exertions of the elector Maurice of Saxony a third interim, the *Leipsic interim*,

was adopted at the diet of Leipsic Dec. 22, 1548, which guarded the Protestant creed, but admitted great part of the Roman Catholic ceremonial, and recognized the power of popes and bishops when not abused. But the offense given to the more zealous Protestants by this interim, which Melanchthon, Bugenhagen, and Major supported, led to division in the Protestant church.

INTERLA'KEN ("between the lakes"), a village of Switzerland, is delightfully situated on the right bank of the Aar, in a plain between lakes Thun and Brienz. Along the *Walnut avenue* or *highway*, between the lakes, there is an almost uninterrupted line of hotels or *pensions*. Within a few miles of the village are many of the most wonderful sights that the country affords. Ten miles southward is the Staubbach (the "sky-born waterfall"), with its perpetual iris; a few miles further s., and in full view from the village, are the magnificent Jungfrau and several other remarkable peaks of the Bernese Alps. The visitors are the chief source of income to the inhabitants, who number only (1870) 1896.

INTERLINEATIONS in a deed are additions or corrections written either on the margin or between the lines. In England interlineations in a deed are not fatal, provided only it is proved that they were made before executing the deed. It is usual to put the parties' initials opposite the place where the interlineations occur, in proof of this, or at least by way of memorandum. In affidavits and other documents, the initials should also be put at the places interlined. In Scotland, if the interlineation is at all material, it ought to be signed by the parties, and the fact mentioned in the testing clause, otherwise it will be presumed that the interlineations were made after the execution, and will vitiate the deed.

INTERLOCUTOR, in Scotch law, means a finding or judgment of a judge or court in a cause. In England the word is not used.

INTERLOCUTORY JUDGMENT, in England, Ireland, and Scotland, means a judgment which is not final, but which is merely a step in the suit or action. So as to interlocutory decrees or orders.

INTERLUDE, in music, is a short melodious phrase played by the organist (generally extempore) between the verses of a psalm-tune. In the German Protestant church the interlude (or *zwischenpiel*) is generally played between each line of the verse, to give the congregation time to breathe. To accompany the *chorale* of the Lutheran church with scientific and appropriate interludes is reckoned in Germany the chief test of a good organist.

INTERMARRIAGE. The intermarriage or intercourse of near relatives has been universally believed to entail degeneration upon the offspring, and the act has been condemned and prohibited. The physical deformity and mental debasement of the Cagots of the Pyrenees, of the Marrons of Auvergne, of the Sarrasins of Dauphiné, of the Cretins of the Alps, and the gradual deterioration of the slave population of America, have been attributed to the consanguineous alliances which are unavoidable among these unfortunate peoples. More recently, the same opinion has been supported by the history of deaf-mutism and of idiocy. Of 235 deaf and dumb children whose parentage could be traced, 70, or nearly 30 per cent, were the offspring of the intermarriage of blood-relations. But in opposition to, and apparently destructive of such an hypothesis, may be adduced the unimpaired condition and symmetry of the Jews, of the small Mohammedan communities in India, of the isolated tribes in North America, among whom the repeated intermarriage of near relatives is compulsory. Moreover, this opinion does not hold in the analogous cases among the inferior animals, as the Arabs can trace the pedigree of their most valuable horses to the time of Mohammed, whilst they avoid all crossing; the stud-books in this country record the descendants of racers for 200 years, and show the perpetuation of the qualities of strength, and weight, and fleetness by propagation within the endowed family, both Eclipse and Childers being descended from a horse the offspring of a parent and foal; and the descendants, again, of these horses, which still maintain the highest estimation, afford many instances of very close breeding; and lastly, the Durham ox and the Ditchely sheep were the result and triumph of breeding in and in. The present state of the controversy, as it has been recently conducted in France, may be summed up in the proposition that consanguineous alliances are not necessarily hurtful to the offspring, provided the parents be healthy and robust; but the observations of Devay and Bemiss in America show that such generalizations should be received with caution. It should be added that even were it established that mental disease generally followed such unions, the transmission might depend rather upon the increased certainty of reproducing hereditary tendencies than upon the violation of any physiological law.—Steinau, *Essay on Hereditary Diseases and Intermarriage*; Devay, *Du Danger des Mariages Consanguins* (1862); Boudin, *Dangers des Unions Consanguins*, etc.; *Annales d'Hygiène Publique* (1862); Ribot's *Hérédité* (1874); etc.

INTERMEDIATE HARMONIES, in music, are the harmonies introduced between extreme non-related keys, while modulating from the one key to the other, which harmonies prepare the ear to receive the new key.

INTERMEDIATE STATE. See *ESCHATOLOGY* and *FUTURE LIFE*.

INTERMEZZO, a short dramatic comic scene, with singing, peculiar to the Italian stage, and introduced between acts of an opera or play.

INTERMITTENT FEVER. See AGUE.

INTERMITTENT FEVER (*ante*), a form of fever characterized by febrile paroxysms and intermissions. It is also called fever and ague, chills and fever, shaking fever, and periodical fever. It belongs to the class of malarial fevers which are supposed to originate in the action of *marsh miasm*, which latter is, again, supposed to be produced principally by decomposing vegetable matter in swamps and low grounds. Post-mortem examinations in the few cases which are fatal reveal a condition of the liver, spleen, and brain called *bronzing*, and the presence of a dark pigment in the blood. More or less of this condition probably exists in cases not fatal. There is frequently an enlargement of the spleen, but this is not particularly characteristic of the disease, while the bronzing is. Intermittent fever may be divided into two distinct periods, the period of the paroxysm, and the period of intermission; or, the active and the quiescent. The paroxysm is divided into three distinct stages—the cold, the hot, and the sweating stage. There are usually some premonitory symptoms, but except in a few cases they are slight and often unnoticed. The marked premonitory symptoms are headache and weariness, accompanied with yawning, but they are not characteristic, and serviceable only to those who have had, or suspect an attack of, the disease. The *cold stage* is ushered in with a feeling of chilliness in the back and limbs; there is also pain in these parts and headache. The skin and to some extent the subcutaneous muscles are contracted, producing that condition known as “goose flesh.” A thermometer placed in the axilla, however, indicates an increase rather than a diminution of temperature, although exposed surfaces and the extremities are cooler than natural. Rigors, accompanied by regular shaking of a rhythmical character, are sometimes violent. The pulse is quickened, but small and feeble; the face very pale, and if the attack be severe, livid, as are the roots of the nails, the circulation in the fingers being almost completely suspended. The duration of this stage is variable, sometimes a few minutes, sometimes two hours; the average being about 40 minutes. The second or hot stage usually follows gradually, with flushings of heat, until a decidedly febrile condition is developed. The cold stage is sometimes absent, but is replaced by a nervous condition, or drowsiness, and sometimes coma (q.v.). This occurs in those cases which are called *malignant intermittent*, and which will be noticed further on. *Hot stage*.—The fever which follows the cold stage is often intense; the pulse is full and bounding, and the face crimson. The pain in the back and limbs ceases, but the headache continues. A thermometer placed in the axilla indicates a temperature of from 105° to 106° F., and there is great thirst. This stage lasts from three to eight hours, when the sweating stage commences, perspiration appearing first on the face, then passing to the body and limbs, while the heat, headache, thirst, and all other unpleasant symptoms gradually depart, the patient often passing into a natural slumber. This stage usually lasts three or four hours, when the paroxysmal or active period is over. The sweating is often, but not always, very profuse.

The period of intermission now commences, and according to its duration, before another paroxysm comes on, the disease receives certain distinguishing names, denoting certain types. If the paroxysm come on every day it is called a *quotidian* type. If the intermission be of two days' duration, that is to say, if the paroxysms succeed each other on the third days, the type is *tertian*. If three days intervene, or when the paroxysm reappears on the fourth day, the fever is said to be of the *quartan* type. The quotidian and tertian types are the most common, the quartan is rather rare. Statistics of the U. S. army show that the quotidian and tertian types occur with about equal frequency, but it is probable that the cases which come under observation in private practice would place the tertian form in the majority. Of 98,237 cases in the U. S. army, 51,623 were of the quotidian, 44,857 of the tertian, and 1757 of the quartan type. Cases have been reported of a quintan, a sextan, a heptan, and even an octave type, but in these cases it is not certain that there is sufficient regularity in the recurrence to justify a type title. The type frequently changes from a quotidian to a tertian, and sometimes to a quartan, or in the other direction; but a lengthening of the period of intermission is more common, especially if the patient be under mild treatment: active treatment generally eradicates the disease or causes a cessation of the paroxysms before a change of type can take place. The type may also be compound, that is, the quotidian paroxysm may occur twice every day, in which case it is called a *double quotidian*. In a *double tertian*, a paroxysm may take place every day, but they will have a different character on succeeding days; in other words, there will be two distinct forms of the tertian type, alternating with each other. Sometimes a double tertian occurs in which there are two paroxysms every other day. Another form is a *double quartan*, when a paroxysm occurs on two successive days, while there is none on the third day, the paroxysms being unlike. A *triple quartan* has also been observed, in which there are three successive paroxysms on three successive days, but differing from each other, as in the double forms. These forms are all rare, except the double tertian, which is not infrequent. In the period of intermission the condition of patients varies; some feel quite well, while others experience many unpleasant symptoms, such as loss of appetite, debility, headache, nausea,

and sometimes palpitation of the heart. There is necessarily a more or less anæmic condition, even when the natural or individual force of the person impels him to shake off his unpleasant symptoms, and maintain his bodily and mental functions by activity. Every person laboring under the protracted influence of malarial poison generating intermittent fever has more or less of a *pinched* appearance. All the functions of nutrition are to a certain extent interfered with, sometimes producing enlargement of the spleen. The general appearance observed in persons laboring under intermittent fever is called by physicians *malarious cachexia*. Protracted continuance of the disease is liable to bring on a variety of organic difficulties, according to the constitution of the individual, the liver probably being the organ most often implicated. The causes of intermittent fever are obscure in one sense, yet the conditions which produce the disease are well known. Though marsh miasm is known as the principal factor in the generation of the disease, we cannot precisely state what marsh miasm is. Although, as will be noticed further on, certain low forms of vegetable life have been discovered and claimed to be present wherever intermittent fever prevails, and to be absent when it does not prevail, the observations have not yet been verified; and awaiting further investigations, we can assert only that there is in marsh miasm such a disease-generating force. Wherever marsh miasm can be excluded as a factor, there intermittent fever is always absent. There are, however, marshy districts where intermittent fever does not prevail. It appears, therefore, that the marsh miasm which generates the fever is of a peculiar nature, or that the emanations of marshes are not always miasmatic; that there must be something added to the exhalations which arise from simple vegetable decomposition or decay, or that some peculiar organism must be developed which when taken into the system will produce the disease. Viewing the question in this light, the theory of the generation of intermittent fever which was proposed by Dr. J. H. Salisbury (an account of which is contained in the *American Journal of Medicil Sciences* for Jan., 1866) deserves attention and careful test. Certain facts have long been known in regard to many of the conditions which propagate the disease. It does not prevail in high mountain regions where the soil is barren, or upon extensive sandy sea-beaches, where it is impossible for any of the products or peculiar accompaniments of marsh decomposition to be present. Therefore that a certain influence is generated in marshy districts which is capable of producing malarial fever cannot be doubted. The disease does not occur in those zones where the temperature never rises above 60°. Malarious influences increase as we approach the equator, and are noticeable along tide-waters where the shores are low and alternately inundated and left exposed to the heat of the sun. Turning up the soil or excavating for the streets of cities and for railroads, the clearing away of forests, and the consequent exposure of the rich soil to the action of the sun's rays, often converts a salubrious section into one exceedingly unhealthful. Many facts connected with malarial influence are worthy of notice. The malarial poison, whatever it is, seems to have a specific gravity. When it travels over the earth it keeps near the surface; persons occupying the upper stories of houses located on a malarious plain are less affected than those living nearer the ground, particularly if they remain in-doors after sunset, for it is another well remarked fact that night air contains more of the malarious influence than the air of day does, as though a degree of sensible moisture were necessary for its propagation. Now, the theory of Dr. Salisbury meets many of these facts. His observations were made on low-lands in the Ohio and Mississippi valleys, principally in the vicinity of Lancaster, Ohio. He discovered certain organisms in the expectorations of persons laboring under the disease, which he also found in the soil, or collected upon glass plates in the vicinity of the residence of the patient. He suspended glass plates at different elevations over different localities, and found that there was a certain level above which the malarial influence did not pass, and that this level was also the limit to the passage of these organisms. He also found that the organisms were not present in the dry air of day, arising only in the damp air of evening or night. The organisms in question are a species of algae resembling *palmettae*, which he found upon the surface of the soil, particularly where it had been disturbed, as by the feet of cattle, or by wagons. They have the appearance of green, red, and white incrustations, resembling a saline deposit from evaporation. Dr. Salisbury has given the name *gemasma* to the plant, to which he also applies the name of *ague plant*. He enumerates the following species: *G. rubrum*, *G. verdans*, *G. paludis*, *G. plumosus*, *G. alba*. Dr. Salisbury remarks that the lesions in intermittent fever, are confined mostly to epithelial structures, and therefore the liver and spleen are organs that suffer specially, and refers to a case reported by Morgagni in which the spleen weighed 8 lbs., and to one by Bailly in which it weighed 10 lbs., and was a mere mass of pulp. Dr. Salisbury found the ague plant in the urine of the patients; if the plant be the cause of intermittent fever, this would form a diagnostic symptom of value in obscure cases. Dr. Salisbury states (Oct., 1880) that subsequent observations have, in his opinion, confirmed the results of his investigations as published in 1866.

Treatment.—It may be said with great confidence that intermittent fever is one of the few diseases which the physician expects to combat successfully by the administration of drugs. There are drugs which have a specific curative action, and also those which have a decidedly beneficial effect as adjuvants. The principal specific remedy is *Peruvian bark*, or its alkaloids, which are commonly preferred. Of these, *quinine* and *cinchona*

chonidia, usually in the form of sulphates, are most used. Quinia has been long in use as an antiperiodic, but cinchonidia is a recent introduction. It is much less expensive than quinia, and by many its action is preferred, as being milder and more permanent. The dose of quinia varies with the constitution and condition of the patient, but as a general statement, in a case of well developed tertian, the cure will require from 20 to 60 grains of quinia sulphate, or one-half more of cinchonidia, divided into 5 or 10 repeated doses; and it is advisable to give in connection some alkaline salt, as the bicarbonate of soda, or of potash; or when a laxative effect is desired, Rochelle salts. It is often advisable to precede the administration of the anti-periodic with a cathartic, and for this purpose there is nothing better, if the patient will consent to take it, than powdered rhubarb, in the dose of a dram or more. Less may be given if combined with one-half or one grain of podophyllin; or podophyllin may be given alone, or combined with five or six grains of calomel. The quinia or cinchonidia is often given to the extent of producing ringing in the ears, one of the symptoms of *quininism*. This, however, is not always advisable or necessary; a continued use of one of these remedies during convalescence, in conjunction with some preparation of iron, generally meets the demands of the case.

Dr. Gaspar Griswold of New York has used the alkaloid of jaborandi, in the form of *muriate of pilocarpin*, in a number of cases of intermittent fever, and his reports in the *Medical Record* indicate that the remedy possesses great value. It does not appear that the remedy has any specific action on the *materies morbi* of the disease, as many suppose to be the case with quinia, but that it breaks up the stages of the attack in consequence of its powerful diaphoretic qualities. Dr. Griswold administers it hypodermically, using from one-sixth to one-fifth of a grain, dissolved in water at the commencement of the cold stage. The effect is to bring on the second or sweating stage in a few minutes, thus abolishing the hot stage.

The results in one of the cases which occurred in 1879 are given in the following table:

1st paroxysm, no treatment.		2d paroxysm.	
Time.	Temp. of Axilla.	Hypodermic injection of $\frac{1}{5}$ gr. of pilocarp. mur. at 11.09 A.M.	Temp. of Axilla.
11.15 A.M.	101 $\frac{1}{2}$	11.05 A.M.	102
11.45 "	103	11.35 "	100 $\frac{1}{2}$
12.15 P.M.	103 $\frac{1}{2}$	12.05 P.M.	99 $\frac{1}{2}$
12.45 "	104	12.35 "	99 $\frac{1}{4}$
1.15 "	105	1.05 "	99 $\frac{1}{4}$
1.45 "	104 $\frac{1}{2}$	1.35 "	99
2.15 "	103 $\frac{1}{2}$	2.05 "	99 $\frac{1}{2}$
2.45 "	102 $\frac{1}{2}$	2.35 "	99 $\frac{1}{4}$
3.15 "	100 $\frac{1}{2}$	3.05 "	99
3.45 "	99	3.35 "	99

The patient had no more chills during the next ten days without further treatment, and was discharged as cured. These results, if verified, may change somewhat prevalent views in regard to the therapeutic action of quinia. Here we have a remedy which seems to act by interrupting the stages of the paroxysm; but jaborandi may possibly have some specific action also.

Malignant intermittent or *Pernicious intermittent fever*, sometimes called *Congestive* intermittent.—Intermittent fever, ordinarily not a dangerous disease, has a form the cause of which is not always discoverable, but which is one of the most fatal diseases. Fortunately the cases are rare, except during certain seasons, in very malarious regions. It is more prevalent in the southern and western states, as the level portions of Alabama, Mississippi, Louisiana, and about the estuaries of some of the creeks and rivers emptying into the great lakes. Sometimes the malignant character of the attack is not manifested in the first paroxysm, or even the second, and is thus likely to deceive the practitioner; but it often reveals itself in the first paroxysm, and may then cause death. Prof. Drake states that the first symptoms, however, are more or less anomalous, and will give warning, especially if other cases have taken place in the neighborhood. The symptoms vary, and yet to the experienced are characteristic, taken in connection with the history. The patient becomes rapidly delirious, or stupid, or comatose; or coma may follow delirium. Sometimes epileptiform convulsions occur. In some cases there is very great sweating, and sometimes the extremities become as cold as marble. Sometimes there is vomiting and purging, followed by a collapse, as in cholera. Sometimes the urine fails to be secreted, and frequently there is albuminuria. There is often hemorrhage from the stomach, bowels, or kidneys, or all of these organs. The pulse is small and irregular, and there is often great difficulty in breathing. If the pulse gets fuller the patient may get relief, but if the paroxysm passes off without much improvement, the next one will not unlikely prove fatal. The pathological conditions found after death do not differ essentially from those found after death from ordinary intermittent fever, except that they are intensified; and it is possible that the disease is caused by the generation within the system of an excessive amount of malarial poison, the eliminative functions of the system not having acted. During the prevalence of intermittent fever, if there be a tendency to the

malignant type, the number of these cases will be diminished by adopting, generally, prompt, active, and sustaining treatment. During the paroxysm the application of warmth in various ways, by warm blankets, bottles of hot water, hot bricks, or other materials, as sinapisms, should be made. The administration of chloroform, in dram doses, is recommended on good authority, the dose being repeated, if necessary, till anesthesia is produced. But the chief reliance for the expulsion of the disease is in the administration of quinia or cinchonidia, and the action of either of these medicines will be much promoted by giving it in connection with those simple alkalies which have been found to give activity to the secreting functions of the skin and glandular organs, such as the carbonates of soda and potash. Ammoniacal carbonate may also be found useful. Wine is demanded, probably in every case, and all possible means of supporting the strength should be employed. The diet should be carefully selected with great regard to the condition of the patient. Beef-tea, the staff diet of the sick-room, is not to be omitted, and steak may be chewed and the juices swallowed if the patient have any appetite for it. All articles of food should be liberally salted. The axiom that recovery from disease consists in regeneration of tissue should not be lost sight of in the treatment of this disease more than in any other. The nervous system should be supplied with the best products of nutrition. During a state of coma, or at other times, if the stomach be irritable, quinia may be administered by means of a hypodermic syringe. The drug is dissolved in water containing 10 drops of sulphuric acid to the ounce, and from 20 to 40 grains are sometimes administered. The chief objection to this mode is in the bulk of the injection, and the inflammatory swellings that are liable to ensue. But these must be regarded in connection with the dangerous condition of the patient. Tepid bathing must not be neglected. If recovery takes place, but the malarious cachexia remain, a change of air and climate will be advisable, and the place selected should have an atmosphere as pure as possible. Colorado possesses the climatic conditions desirable in such cases.

INTERNATIONAL DATE-LINE.—The line at which dates change, being made later by one day by those who cross the line from east to west, and earlier by one day by those crossing it from west to east.

If a person start at midday, that is, when the sun was shining perpendicularly on the meridian that passes through the place of starting, and travel westward, keeping pace with the sun, thus keeping the sun directly over the meridian of the place at which he might be, he would make a complete journey around the globe in twenty-four hours, and return to his place of starting at noon the next day. Twenty-four hours would have passed, but to the traveler the sun would have been shining perpendicularly as at noon all the time; and the question arises, when or at what point did the traveler change from noon of one day to noon of the next? For instance, if he should start at Monday noon and keep the sun in the zenith, he would arrive at the place of starting Tuesday noon—it would be noon-day to him during the whole journey of twenty-four hours—Monday noon would change to Tuesday noon without an intervening night: where would the change occur? It is to him apparently still Monday noon, and to obtain the correct date he must drop a day. The reason for dropping a day can be more fully shown as follows:—Remembering that the earth makes one complete revolution on its axis in twenty-four hours, and thus the sun in its apparent diurnal revolution moves over 360 degrees of space in twenty-four hours, it thus moves over 15 degrees of space in one hour, from which it is evident that the difference in longitude which causes the difference in the relative time, may be estimated in time, allowing 15 degrees to an hour, or one degree to four minutes. Therefore, suppose a man starting from any given point, travel one degree w., his watch, instead of marking 12 o'clock at noon, according to the correct time at that place, would mark four minutes after twelve. Let him travel w. 15 degrees, and he will find that 1 o'clock by his watch will be noon-day by the sun. Let him go on to 120 degrees, and when the sun is in the zenith his watch will indicate eight o'clock P.M. Completing his journey around the globe, he will have gained, in this manner, twenty-four hours. From this it will be seen that in order to obtain the correct date twenty-four hours must be subtracted from his time. On the other hand, if a person could travel eastward at the same speed with which the sun apparently travels westward (the same rate of speed with which the earth revolves on its axis), if he should start on his journey at noon-day, he would meet the sun when exactly on the opposite side of the earth from the place of starting, and continuing the journey would again meet the sun at the place of starting, thus seeing three noon-days within the twenty-four hours, or apparently gaining a day. This we know to be impossible, since only twenty-four hours of time have passed, while in reality an extra period of light has been gained, and thus to obtain the correct local date a day must be added to your time.

From this we see that, for every time a person travels around the earth in either direction, there is a difference in time of one day, and the result is the same regardless of the rate of speed. To avoid the confusion of dates which must necessarily result from this constant gain on one side and loss on the other, it has been proposed to determine

upon some line at which eastern bound travelers shall add a day, and westward bound travelers shall drop a day from their reckoning, and thus prevent a disagreement in regard to the day of the week. The line at which this addition or subtraction shall be made is what is meant by the date-line.

The fact and necessity of such a date-line may be shown in a way with which all are familiar. Take a simple problem in arithmetic on "longitude and time." "When it is 9 o'clock A.M., May 1, at Singapore, long. 104° e., what time is it at Manila, long. $121^{\circ} 30'$ e.?" The difference of longitude estimated *eastward* from Singapore is $17^{\circ} 30'$. The application of the ordinary rules of arithmetic gives for an answer, 10 h. 10 m. May 1. But the difference of longitude estimated *westward* from Singapore is $342' 30'$, giving for an answer 10:10 A.M., April 30. This shows that when the time of day at one place is known, and the longitudes of both places known, the time of day at the other may be obtained in two ways, viz.: by using the difference of longitude estimated west, or estimated east. But the dates thus obtained differ by one day; which is correct? Sometimes the one and sometimes the other. In the problem just considered the latter result is correct. In such problems the difference of longitude must be taken in such a direction as not to come across the date line; or if the date-line be crossed, the dates must be changed in accordance with the above definition.

The calendars in general use throughout the civilized world originated in Rome. The one most generally adopted is the Gregorian. Russia, and all other countries of the Greek church, still use the Julian calendar. The two calendars differ as to the day of the month, but agree as to the day of the week. Which ever calendar is used, all places received their date from Rome. Places receiving dates by westward communication from Rome would naturally be considered earlier in time, at the same instant, and those places receiving dates by eastward communication would be considered later in time at the same instant; and date-lines would naturally occur where these directions of communications met. Such is the fact. The western part of Europe, the islands of the Atlantic ocean, the whole of South America, and the greater part of North America, have received civilization by westward communication from Rome. Therefore there is no date-line in the Atlantic or in America (since the occupation of Alaska by the United States). The eastern part of Europe and Asia received civilization by eastward communication from Rome. Date-lines, therefore, occur in the Pacific ocean between islands that have received dates by eastward, and those that have received by westward communication. By connecting these lines we have an irregular line whose general direction is n. and s., and which may properly be called the date-line, though not always, and perhaps not usually, the line where vessels change dates. The north-western part of North America, otherwise known as Russian America, now Alaska, received civilization by eastward communication, therefore their dates would correspond with those of Asia; but the north-western part of British America received civilization by westward communication, thus the dates there would correspond with eastern America and Europe. From this we see that two neighbors, one living in Russian America and one in British America, might differ as to the day of the week. This was often the case before Alaska was purchased from Russia by the United States in 1867. The dating in Alaska has been put back to conform with the rest of the United States. The date line, therefore, must now pass through Behring's straits, or, according to some authorities, just w. of the strait. North of the strait some authorities claim that it passes between Plover and Herald islands, which holds, as the former was discovered from the eastern continent and the latter from the western. South of the strait it passes w. of Clarke's or St. Lawrence island. Thence it passes w. of Gores island; thence south-westerly between the Aleutian islands and Asia. It thence passes south-westerly some degrees e. of cape Lopatka and the group of Kurile islands, thence just e. of the Japan islands, Jesso and Niphon, keeping w. of Guadalupa and Margaret's islands, but e. of Bonin, Loo Choo, and Patchoo islands, and s.e. of Formosa. This island was unknown to the Chinese until about 1403. About 1634 the Dutch established themselves here, and built fort Zeland on a small island commanding the harbor of the capital Taeman. After retaining possession for 28 years, they were expelled by Coxinga, a famous Chinese rebel, whose successors ruled until 1683, when it was taken by the Chinese. It thus retains the same dating as the Chinese nation proper. The line then passes through Bashee channel, just n. of the Bashee islands. It enters the China sea e. of Hong Kong. It then passes s. just w. of the Philippine islands, but keeps e. of Palawan island. It is here that it reaches its most western point, being about 116° e. longitude. It then takes a south-easterly course, passing through the Sooloo islands, s. of Mindanao and n. of Gilolo. Thence it passes e. nearly parallel with, but just n. of, the equator to a point about 165° just n. of Shank island; thence south-easterly, leaving High island, Gilbert archipelago, Taswell islands, and the De Peyster group on the n.e.; thence to a point n.e. of the Navigator or Samoan islands to longitude about 268° w.; thence it turns s., keeping e. of the Navigator, Friendly, Tonga, Vasquez, Kermadec, and Curtis islands, and w. of the Society islands, and Cook's or Harvey islands; thence it continues s., bearing a little to the w., so as to cross, according to some authorities, Chatham island; thence to the south pole. By following this description the line can be traced with a pencil on a map of the world.

The popular idea seems to be that 180° e. or w. of Greenwich is the point at which

the change occurs. National pride is not likely to give England the right to consider the 180° w. of Greenwich as having any special advantage over the 180° w. of Berlin, Paris, Vienna, Rome, Madrid, St. Petersburg, or even Washington, D. C. A vessel sailing from San Francisco to Samoa would reach its destination before reaching 180° w. of Greenwich, and would find itself a day behind the Samoans in date. Other illustrations might be given to show that the 180° fiction does not remove the difficulty. For instance: the Spaniards on the Philippine islands still use the latest dating; a navigator sailing from San Francisco to these islands, who had changed his date at 180° , would find himself a day ahead on his arrival. This would not be the case if he had sailed to Yokohama or Hong Kong, which have the advance dating. In making a round trip from San Francisco to Yokohama, a navigator might keep his dating unchanged and thus be right on his return, or he might make two changes, skipping a day on his outward voyage at any time or place on the way, and dropping a day at any time or place on his return. Cruising vessels are said not to regard the 180° in their dates, as they might in some cases have to change their dating very frequently.

Numerous proposals have been made for an initial meridian for all nations, in order to dispense with the many now in use, but no satisfactory proposition has yet been made. M. de Beaumont suggests one passing through Behring's strait. Rome has also been suggested for various reasons, among them the fact that it was the home of old and new style, and need not offend national pride; and because it is nearly on the meridian of Copenhagen, Uraniburg, Leipsic, Munich, Padua, Venice, Christiana, Gotha, Neronia, and Modena, and not far w. of those of Berlin, Prague, Naples, and Palermo. This meridian band has been called the great street of the world's observatories. With this suggestion there has been coupled the suggestion that Rome be made 180° , and that 0° be left unmarked, passing somewhere along Behring's straits, and that e. and w. as applied to longitude be dispensed with.

Another point may be noted. Taking the line as described, its most western point on the Philippine islands is 117° e., and the most eastern point is 168° w. longitude. Using these limits, from the time any given time or day begins to the time it ends is 53 hours. Or taking the eastern part of Alaska, as was formerly done, which is 130° e., and a day remains on the face of the earth for 55 hours and 32 seconds. Taking the former, we can see that for 5 hours each day, by the same calendar, there are three different dates in different parts of the world. These hours in Washington, D. C., and all places on or near that meridian, are from 6:10 A.M. to 11:10 A.M. For instance, during these hours of to-day, Jan. 1, 1881, with us, the Navigator islands are in the early part of Jan. 2, and the Philippine islands are finishing Dec. 31, 1880.

INTERNATIONAL LAW is divided into public international law and private international law. 1. *Public International Law*, or the law of nations, consists of those rules which independent nations agree among themselves to be just and fair in regulating their dealings with each other in times of war and peace. The mode in which they arrive at this common understanding of what is just and fair, is by comparing the opinions of text-writers who profess to set forth and collect the general opinion of civilized nations, for all these writers appeal ultimately to the principles of natural reason and common sense, as the test of what they profess to be the proper rule. Treaties of peace, alliance, and commerce also define and modify the existing international law as between the contracting parties. The decisions of prize-courts, which profess to proceed on principles of natural justice, of universal application, are also declarations of this international law. The leading doctrines thus adopted are as follows: A sovereign state is one which governs itself independently of foreign powers. In the event of a civil war in one nation, other nations may remain indifferent spectators, and treat the ancient government as sovereign, and the government *de facto* as entitled to the rights of war against its enemy. If the foreign state profess neutrality, it is bound to allow impartially to both belligerent parties the free exercise of those rights which war gives to public enemies against each other, such as the right of blockade, and of capturing contraband and enemy's property. Where a colony or province asserts its independence, and has shown its ability to maintain this independence, the recognition of its sovereignty by other foreign states is a question of policy and prudence only; but until acknowledged, courts of justice and private individuals are bound to consider the ancient state of things as remaining unaltered. When a change occurs in the person of the sovereign, or in the internal constitution of a state, all treaties made by such state which were not personal to the former sovereign, continue to be binding on the succeeding sovereign.

All sovereign states are, in the eye of international law, on a footing of equality. Each state has the right to require the military service of its own people for purposes of self-defense, and to develop all its resources in the manner it thinks fit, so long as it does not interfere with the same equal rights of other nations. When, however, one state unduly aggrandizes itself, and augments its military and naval forces beyond what all the other states consider proportioned to its position, then those other states have some ground to interfere. This, however, is considered a delicate business, and not to be attempted rashly; and it is difficult to define what is a just ground of interference. The acquisition of colonies and dependencies has never been considered a just motive for such interference. According to Wicatton (*International Law*, 88, 6th ed.), interferences

to preserve the balance of power have been generally confined to prevent a sovereign, already powerful, from incorporating conquered provinces into his territory, or increasing a dictatorial influence over the councils and conduct of other independent states. The aversion to interference has no doubt in modern times, become stronger and stronger; and it may be taken to be now almost an axiom, that no foreign state has any just ground of interfering in what is merely an internal revolution of a state, or a mode of readjusting its own constitution; in short, each state ought to be allowed to manage its own internal affairs, and to choose whatever form of government best suits the people, for the exercise of this right can, in general, nowise affect other states.

Each state has the natural right to make its own laws regulating the property and status of all the subjects within its territory. On the high seas, both the public and private vessels of every nation are subject to the jurisdiction of the state to which they belong. Offenses there committed against its own municipal laws give to the state to which the vessels belong jurisdiction; but no right of visitation and search belongs to a nation in time of peace, though piracy and other offenses against the law of nations, being crimes not against any particular nation, but against all mankind, may be punished by any state in which the offenders can be found. The traffic in slaves is, however, not classed with piracy by the law of nations, though nations may declare it to be so as regards their own subjects; and they may also enter into a compact as to that matter, as has been done by Great Britain with other nations. With regard to crimes and their punishment, though each state will punish all crimes by whomsoever committed, if committed within its own territory, and also all crimes committed in its public and private vessels on the high seas, or in a foreign port; likewise all crimes, wherever committed, by one of its own subjects, yet it cannot arrest one of its own citizens if he is within the territory of another state; to do so would be an invasion of the municipal law of that state; hence it can only arrest its criminals in foreign states by the leave of such state, and such state is not bound to accede to such a request. Hence arises the expediency of two states entering into an extradition treaty, by which they bind themselves to give up to each other criminals who have committed certain specified offenses.

There are certain usages or ceremonials of respect shown by one nation to another in certain circumstances, and these are founded on the theory of the equality of sovereign states. As regards the right of precedence among kings, emperors, and princes, there is nothing settled and binding, except, perhaps, that Catholic powers concede the precedence to the pope. But as regards minor matters, it is the settled courtesy for one nation to salute by striking the flag or the sails, or by firing a certain number of guns on approaching a fleet or a ship of war, or entering a fortified port or harbor. Sometimes these ceremonials are regulated by express treaty, as, for example, as regards the maritime honors formerly exacted by Denmark from vessels passing the sound and belts at the entrance of the Baltic sea.

The rights of states in time of peace consist of the rights of legation and of negotiation. Every independent state has a right, in point of courtesy and usage, to send public ministers or representatives to, and receive ministers from, any other sovereign state with which it desires to maintain relations of peace and amity. See **AMBASSADOR; ENVOY; CHARGÉS D'AFFAIRES; CONSUL.**

When war is commenced between two countries, there are certain rights acknowledged to exist towards each other. Before war is proclaimed, intermediate methods are sometimes adopted, with a view to avoid that last necessity; these are laying an embargo on the ships or property of the offending state found in the territory of the offended state; also taking forcible possession of the thing in controversy, also retaliating and making reprisals. When war is once declared, the first step is to seize and confiscate all the enemy's property within the territory. It becomes unlawful for the subjects of each belligerent state to trade with the subjects of the other belligerent. The test of whether a person is a subject of either state is generally his domicile; so the character of ships depends on the national character of the owner, as ascertained by his domicile. As regards the conduct of one belligerent state against the other, some writers have laid it down, that everything is fair against an enemy, and that no means of punishment are too severe; but this rigid rule has been qualified by the more humane practice of modern times. Instead of putting prisoners of war to death, the practice is to exchange or discharge them on conditions. Instead of indiscriminate destruction of the enemy's property, temples, public edifices, monuments of art and science, are spared. The laws of war are more unsparing at sea than on land; the practice prevails of commissioning privateers to prey on the commerce of the enemy, the captor being in general entitled to the property. When property taken is recaptured, states differ as to the mode of dealing with the property recaptured. The validity of a capture at sea must be determined in a prize court of the captor's country or of an ally, and the prize court professes to act on universal principles applicable to all countries.

As regards neutrals in time of war, the leading doctrines are stated under the heads **CONTRABAND OF WAR; BLOCKADE; FOREIGN ENLISTMENT ACT.**

At the congress of Paris, 1856, the ambassadors of Great Britain, France, Russia, Austria, Prussia, Turkey, and Sardinia, agreed to a joint declaration, modifying the state of the laws of war as follows: 1. To abolish privateering; 2. To adopt the maxim, "free ships, free goods"—i.e., an enemy's goods shall not be taken in a neutral ship unless

they are contraband of war; 3. To allow a neutral's goods in an enemy's ship to be free except as to contraband; 4. To abolish blockades unless they are real and kept up by an effective force. These declarations were not acceded to by America, because it objected to the abolition of privateering, so that though, in the event of war between the countries which agreed in the declaration, the above modifications will probably be adopted, this will not be the case in the event of America being at war with one or other of these parties. See Wheaton's *International Law*; Mackenzie's *Studies in Roman Law*; Macqueen's *Chief Points in the Laws of War*.

2. *Private International Law* is that collection of laws that regulates the mode in which ordinary courts of justice administer the remedies and give effect to the rights of parties where such rights were acquired partly or wholly in a foreign country, and where different remedies must otherwise have necessarily applied. In such cases, the court which administers the remedy, acting on what is called the courtesy of nations, *comitas gentium*, endeavors to put the parties in the same position as if they were still bound by the foreign laws, and gives effect to those laws so far as they do not conflict with the native laws in essential principles. The fundamental doctrine which underlies this branch of law is, that each subject of a foreign independent state is entitled to have the protection of his own laws, so far as is compatible with the equal independence of the state whose courts administer the remedy, and hence, though a court can in general only administer the laws of its own state, it may, *pro hac vice*, incorporate part of the foreign laws as part of its own remedies. Accordingly, in carrying out this doctrine, certain fair and equitable rules are adopted in dealing with foreigners in certain situations, the chief of which arise out of the heads of marriage, death, intestacy, and remedies generally.

This branch of the law has been long cultivated by the continental countries of Europe, where many learned jurists have discussed its principles. But probably owing to the insular position of the United Kingdom, little attention was given to it there; and indeed no work even incidentally treated of the subject until Mr. Justice Story, an American judge, in 1834, first produced his celebrated treatise on the *Conflict of Laws*, and gave to British lawyers a methodical view of the results at which foreign jurists had arrived. In the United States, where each independent state had its own municipal laws, which often differed materially from those of the other federal states, it was natural and inevitable that some system should be adopted as to the way each state should deal with the rights of persons coming from the neighboring states; and hence America preceded England in the development of this branch of the law. Story's work is still the standard authority in the United Kingdom. Since the laws of Scotland differ in many respects from those of England and Ireland, and each country has its own courts exercising independent jurisdiction, it is a matter of course that questions of conflict under these two codes of law should often arise. Not only do the courts of Scotland and England treat the laws of the other country as foreign laws, and deal with each other in much the same way as they would deal with France, or any other foreign country, but the laws in other respects are materially different, and give rise to conflicts. On this particular branch of the law affecting England and Scotland, Mr. Paterson's *Compendium of English and Scotch Law* contains a summary of all the material differences existing between the laws of these two countries, that are of the greatest practical importance to residents in the United Kingdom.

As regards marriage, the leading doctrine of the *comitas gentium* is, that it is immaterial in what part of the world a man is married provided he is married, and when once married according to the law of the place where he then is, such marriage will be held a valid marriage all the world over, and wherever he goes. This doctrine, however, is qualified in this way, that the *lex loci contractus*—i.e., the law of the place where the marriage was contracted—shall regulate the validity of the marriage only so far as any ceremony is essential to the institution of marriage; but it is not allowed to dictate who the parties are who may validly marry, nor to vary any essential part of the contract. The reason of the latter qualification is, that there may be rules of policy in one country which may prohibit marriages between certain persons, or may prohibit certain consequences, and therefore the evasion of the native law by persons going abroad for such a purpose is not to be tolerated. For example, in Scotland, marriage is treated as a mere contract, which requires no particular ceremony beyond mere mutual consent; while in England some ceremony is absolutely essential—viz., the ceremony of the marriage being celebrated in a parish church by a priest, or in a superintendent-registrar's office, if there is no priest. Accordingly, any two English persons may go to Scotland and be married there by exchanging a verbal declaration of marriage; and if one had resided there 21 days before, they will be held to be married persons, and may immediately return to England, if so disposed. On the other hand, if two Scotch persons go to England, they cannot be married by exchanging mere verbal declarations; they must be married, according to the English law, either by a priest in a church or without one in a superintendent-registrar's office; and if so, they will be held to be married all the world over. Again, the law of England declares that no marriage shall be valid within certain prohibited degrees, and amongst others no man is there allowed to marry his deceased wife's sister. Hence, if a man and his deceased wife's sister go from England to Denmark, where the law allows such persons to marry, and they there are married

according to the form there prevailing, and then return to England, where their domicile is, they will not be treated as married persons, because they went to evade their own law in a matter which is considered of vital importance. It would, however, be different if a man and his deceased wife's sister, who were Danes, and domiciled in Denmark at the time of their marriage, came afterwards to this country; they would in that case be treated as properly married, for their domicile was then Danish, and they had a right to follow their own law.

Another important head of international law is as to the law which regulates the succession to the property of a person deceased. On this subject, the rule is, that it is the law of the country in which a man was domiciled at the time of his death which regulates the succession to his personal property, even though such property is scattered over all parts of the world; hence, it is necessary first to ascertain where the deceased person had his domicile. See *Domicile*. The above rule as to the domicile of a deceased person governing the succession applies only to his personal property; as to his landed or real property, the succession to it is governed by the law of the country where such land is situated. Hence, if an Englishman dies domiciled in England, leaving a Scotch estate, such estate will descend according to the Scotch, and not the English law, and it is well known the rules of succession differ materially in the two countries. See Paterson's *Compendium of English and Scotch Law*. Where the person does not die intestate, but leaves a will, then it is now, by statute, almost immaterial whether his will was made according to English or Scotch law.

Another important head of private international law is as to the court in which a remedy can be obtained on ordinary contracts. The rule is, that wherever a contract was made, the contract must be valid according to the law of the place where it was made, but the remedy may be had anywhere else wherever the defendant can be found. Thus, if a person makes a contract or incurs a debt in Scotland, and afterwards goes to England, he may be sued in the English courts, though the English court will only allow the remedy, provided the contract was valid according to Scotch law. It follows also from this rule that if a debt be incurred in Scotland which would prescribe in three years, yet, if the debtor be in England, he can be sued any time within six years, for that is part of the English remedy. It is often of no small importance to know where and in what country a person may be sued. The general rule is that one must follow his debtor, and sue the debtor in whatever country such debtor resides. In this respect, however, Scotchmen have greater advantages over Englishmen than Englishmen over Scotchmen, for while the rule in England is that a Scotchman can only be sued there in ordinary cases, provided such Scotchman is actually present in England, and can be personally served with process of the court—i.e., with a copy of a writ of summons—in Scotland the rule is that in many cases an Englishman can be sued though he never in his life were in Scotland at all; it is enough if he has some debt due to him there, or has left some trifling article of property—such, for example, as his umbrella—which can be arrested. In the latter case the chattel or debt is first seized by the Scotch creditor, in order to found jurisdiction, or, as it is technically called, *arrestum jurisdictionis fundande causa*, and then the Englishman can be sued, and judgment may be obtained against him in his absence, even though he never heard of the action. Englishmen have often complained of this as a barbarous practice of the Scotch courts; nevertheless, the very same practice exists in the city of London, though nowhere else in England. When judgment is once obtained either in England, Scotland, or Ireland, it is now competent for the judgment creditor at once to attach or seize the goods of the debtor in either of the two other countries, if in the mean time the debtor has gone there. The creditor used formerly a fresh action in the new country to which the debtor had removed, and went over precisely the same process again. This circuitous process has been at last effectually remedied by an act of parliament, which allows execution to follow judgment in any of the three kingdoms, except where a Scotch judgment was founded on arrestment only.

INTERNATIONAL LAW (*ante*) is the body of rules, derived from custom or from treaty, by which nations, either tacitly or expressly, agree to be governed in their intercourse with each other. Some of the rules have existed from the beginning of history; their number has gradually increased, their scope widened, and their quality improved. The Amphictyonic council, formed in very early times and limited to Grecian tribes, required that after a battle an exchange of prisoners should be made, and a truce declared in order that the dead might be buried. They also bound themselves not to destroy any city included in the alliance, or to cut it off from running water in war or peace. The Romans in their early days established a college of heralds for declaring war, and allowed only sworn soldiers to take part in it. The influence of Christianity, declaring the universal brotherhood of man as one of its fundamental truths, has been great and beneficent in the sphere of national character and intercourse. Many barbarities fell at once before it, and many others have been gradually mitigated and subdued.

International law has two natural divisions—the one containing rules for the intercourse of nations during peace, and the other regulating the changes made by war.

I. Rights and duties of nations during peace.

- The parties to international law. Individuals cannot be parties; but may, if strang-

ers, claim humane treatment under the law of nature broader than that of nations. Only independent, organized communities are nations, and have the power of making treaties with other nations. Protected or dependent states, provinces and colonies, the members of confederacies, and separate kingdoms made one by a permanent compact, must conduct all their intercourse with other nations through that nation on which they are dependent, or of which they are a part. No particular form of government and no difference of religious belief necessarily excludes a nation from the obligations and advantages of international law. Independent states have equal duties and rights, without reference to their size or other relative differences, and are sovereign in the sense of having no political superior. The individual states of the American union may be said to have a certain local and relative sovereignty; but with respect to other nations the United States only constitute a sovereign state. International law deals only with state *de facto*. While a body, hitherto dependent or forming a part of a nation, is striving to effect its independence, other nations cannot help it, without creating a state of war with the parent state. A state cannot evade its obligations by change of constitution. Denmark and Norway, when separating in 1814, each took its share of the debt of the united kingdom; and the United States assumed the debts of the preceding confederation. The independence of a state implies, first of all, freedom in the conduct of its internal affairs. Generally there can be no legal interference with them by another state. Yet when a state, by external alliances, is increasing its power in a degree that endangers the welfare or tranquillity of its neighbors, the right of interfering in order to preserve the balance of power is claimed and has been exercised; as, for example, in the war of the Spanish succession, and after the French revolution and the fall of Napoleon. On the other hand, when circumstances do not require or warrant such an interference, there have been national declarations designed to forestall and prevent it. An instance of this was furnished by what is called the Monroe doctrine—president Monroe's declaration made in order to prevent European interference in what had been Spanish America—that “the United States would consider any attempt on the part of the allied European powers to extend their system to any portion of our hemisphere as dangerous to our peace and safety.” Also when any great cruelty has been practiced by the strong against the weak the right of interference by other nations is claimed. A signal instance was furnished in 1827, during the struggle for independence by the Greeks against the Turks, when the allied fleets of Great Britain, France, and Russia destroyed the Turkish fleet.

2. A state has a sovereign right to its territories and property. Its property consists of public buildings, forts, ships, lands, money, and similar possessions. All private property, also, within its limits is under its protection. Its territory includes all the surface of land or water within its limits; of harbors, gulfs, and straits within certain headlands; and of the sea within a league from the shore. Outside of this limit the sea is free to all nations for commerce and fishing. But while foreigners are free to catch fish in any part of the ocean contiguous to the territory of a state—as on the banks of Newfoundland—they cannot dry their nets or cure their fish on the adjoining coasts unless the privilege have been granted by treaty. A ship owned by inhabitants of a country cannot be regarded as national territory, but is simply private property under the protection of the national flag. In a foreign port it may be attached for debt, and its crew are accountable to the laws of the port and of the country for any misconduct which they may commit. Rivers between two countries, unless a contrary provision is made by treaty, are common to both, and the boundary runs through the principal channel. When a river rises in one state and enters the sea in another, each portion, strictly speaking, is subject to the state within whose limits it is contained. The dwellers on the upper shores have no right, except by concession, to descend to the sea through the lower territory. Yet there seems to be an equitable claim to the privilege almost amounting to a right; and within the present century almost all such navigable rivers in the Christian world have been opened by treaty to the use of those who live on their upper waters. Among these may be mentioned the Rhine, Scheldt, Danube, La Plata and its tributaries, Amazon, and St. Lawrence.

3. Duties which foreigners coming into a country owe to its laws and government. Aliens, sojourning in a country, must submit to its laws unless released from their jurisdiction by special treaty or international custom. They are secure in the enjoyment of their property, the use of the courts, and the transaction of lawful business. They can dispose of their property by will to persons residing abroad, or can transmit it to their own country. They have also the protection of consuls and ambassadors appointed by their own country. Several classes of persons are specially exempt, in a greater or less degree, from the jurisdiction of local laws; as, for example, sovereigns traveling through a foreign country, ambassadors accredited to it, the officers and men of national ships in its ports, and foreign armies when passing through it by permission. In England formerly no one born a subject could lawfully expatriate himself, nor could any foreigner be naturalized except by special act of parliament. But in 1844 provision was made for granting foreigners all the rights of native-born subjects except membership of the privy council or of parliament. In the United States a foreigner may be legally naturalized after five years' residence, and three years after he has formally declared his intention to renounce his former nationality and become a citizen. Persons who have committed

an offense against the laws of their country often flee for refuge into another. If the offense be political only, the nations which are most free themselves generally allow the fugitives to remain; but if they have committed, or are charged with crime, they may be delivered up for trial to their own country when demanded according to the provisions of treaties made for the purpose. An ambassador in very ancient times was considered a sacred person; and, as national intercourse and comity have been enlarged, there has been a proportionate increase in his rights and privileges. His person, dwelling-place, property, family, and attendants, are, in a great degree and as a rule, exempt from the criminal and civil jurisdiction of the country to which he is sent. He has liberty of worship, according to the customs of his country and to his own choice, for himself, his household, and by extension of courtesy, for other persons belonging to his nation. In some countries this liberty has been restricted to worship in his own house. Consuls are agents who have no diplomatic character, but are sent to reside in certain districts to protect the interests, chiefly commercial, of the country which appoints them. Their duties are imposed by their own government, and are performed by permission of the foreign power. They are honored and protected by the flag of their country; but their privileges are, in general, much less than those of ambassadors, except in Mohammedan countries, where, having often been required to perform diplomatic duties, they have acquired corresponding rights. The modern office of consul arose in the commercial times of the middle ages, when companies of merchants, going to reside in the eastern parts of the Mediterranean, had officers, chosen at first by themselves and afterwards by their governments, to settle disputes that arose in conducting business affairs. Treaties are compacts between nations for the regulation of intercourse between both governments and people. They comprise, in a great measure, the history of international law. The power to make them is determined by the constitution of individual states. In the United States they are negotiated under the direction of the president, and are ratified by a two-thirds vote of the senate. When they promise the payment of money it must be appropriated for the purpose by a vote of the house of representatives.

II. *International relations as modified by war.*

1. War is a contention by force of arms between two or more nations. In order to be just it must be necessarily undertaken to repel an injury or to obtain a righteous demand. The power of deciding for what purpose and when it is to be waged must be left to each nation, because there can be no other judge. A nation that has been wronged, or thinks it has, may take no notice of the wrong, or employ only peaceful measures to obtain redress, or accept the offered mediation of a friendly power, or propose arbitration, or use armed force. In general, other nations have no right to interfere. Yet, in some cases, war between two nations may become to other nations a cause for war. Mediation offers a way for escaping war which may be equally honorable and advantageous to both parties. Yet it can only give advice which may be rejected by one or both of the parties. Arbitration, in special cases, may be simple, easy, and effective. The parties agree on the arbitrators, the points to be considered, the time and place, and the law which is to govern the case; and they bind themselves to abide by the decision. The success which has, in numerous instances within the present century, been attained by arbitration, and especially in the recent important case between the United States and Great Britain arising out of the war for the suppression of the southern rebellion, warrants the hope that war may often, in a similar way, be avoided. After the happy settlement in the instance last mentioned, the British house of commons presented an address to the queen, praying that measures might be taken "with a view to further improvement in international law and the establishment of a general and permanent system of international arbitration."

2. War between two nations interrupts all recognized intercourse between the individuals members of each. The relations of commerce, the right given by treaty to reside in either country, and all communication by direct channels between them, come to an end. Sometimes permission is granted to remain still in the country; and generally time is granted to remove with property and effects. The treaty of 1794 between the United States and Great Britain stipulates that "neither the debts due from individuals of the one nation to individuals of the other, nor shares nor moneys which they may have in the public funds or in the public or private banks, shall ever, in any event of war or national difference, be sequestered or confiscated." According to chancellor Kent, "as a general rule, the obligations of treaties are dissipated by hostilities." It is said also by another writer that "Great Britain, in practice, admits of no exception to the rule that all treaties, as such, are brought to an end by a subsequent war between the parties." The peace of Westphalia and the treaty of Utrecht have been renewed several times when the nations concerned in them, after having been at war, were making new treaties of peace.

3. The interests of humanity demand that, during warlike operations on land, non-combatants should be molested as little as possible in the prosecution of their peaceful interests and in the enjoyment of their homes. On the sea, ships and cargoes belonging to enemies have, until recently, been accounted lawful prey; but in the enlarged commercial relations of the world much progress has been made towards exempting innocent traffic on the seas from interruption during war.

4. The forces lawfully employed in war are, on land, regular armies, militia, and

volunteers; and, on the sea, national ships and private vessels commissioned by national authority. But as privateering is necessarily attended with great evils, earnest efforts have been made to restrict or abolish it. In 1856 the parties to the declaration of Paris adopted four rules concerning maritime warfare, one of which declares that "privateering is and remains abolished." Other nations were asked to accept them on condition that they would be bound by them all; and almost all Christian states did agree to them. The United States withheld their assent because, as it is their policy to maintain only a small navy, the right to resort to privateering in case of war offers the only way by which they can cope with the large navies of other nations. They agreed, however, to adopt all the rules, provided the signers of the declaration would consent to exempt from capture all innocent traffic of enemies on the sea. In 1861 the offer was made to two of the principal European powers, by the secretary of state, on the part of the United States, to come under the operation of the four rules; but as it was made for the whole republic—the rebellious as well as the loyal states—it was declined.

5. The rights and duties of neutral nations. In recent times the commercial intercourse among people of different nations has become so general and constant, that they are practically united almost into a confederacy so as to be entitled to a voice in deciding whether war between individual nations shall, in any particular case, be permitted. Sometimes, in view of peculiarities in its position, a territory is made permanently neutral so that armies cannot cross its boundaries nor can it engage in war. Switzerland and part of Savoy, since 1815, and Belgium, since 1830, have been in this condition. Sometimes several powers unite in an armed neutrality in order to maintain certain maritime rights against both belligerents. But such a league is liable to result in war. A neutral state must be impartial in its dealings with both belligerents; must keep itself, its territory and subjects, as detached as possible from the war; and be equally humane to both parties when storm, disaster, or hunger casts them on its shores or within its bounds. By the treaty of Washington, in 1871, Great Britain and the United States adopted three rules to be applied in settling difficulties then existing between them, to be observed by them in future, and to be urged on the acceptance of other nations. These rules are—that "a neutral government is bound, *first*, to use due diligence to prevent the fitting out, arming, or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use: *second*, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other; or for the purpose of the renewal or augmentation of military supplies or arms, or the recruitment of men: *third*, to exercise due diligence in its own ports and waters, and as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties."

6. The liabilities and rights of neutral trade. By the rules set forth in the declaration of Paris, a "neutral flag covers the enemy's goods with the exception of contraband of war," and "neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag." The term "contraband of war" is used to denote articles which directly aid warlike operations. According to a formula adopted by the United States, the list includes all kinds of guns, fire-arms, ammunition, weapons, armor, military clothing, equipments for men and cavalry horses, and all instruments, of any material, manufactured and prepared for making war by sea or land. The right of blockade in time of war is universally admitted, but in general is available only for harbors, mouths of rivers, and limited districts of coast. As a blockade begins and ends at definite times, previous notification, of both its beginning and ending, must be given to traders and neutral governments. To be legal, it must be maintained by armed force sufficient to show that it is actual, and to prevent all ordinary and open attempts to pass it. All merely formal, or, as they have been called, paper blockades, like Napoleon's Berlin and Milan decrees and the two counter British orders in council in 1807, are regarded by international law as futile and void. When a vessel is captured and found guilty of attempting to enter or leave a blockaded port, the penalty it incurs is the confiscation of itself and its cargo. In carrying out the international rules adopted concerning contraband goods, enemies' goods on enemies' ships, and blockades, search is often necessary to determine the nationality of the vessel and the nature of its cargo. It must be submitted to by the vessel, but must not be so conducted as to give unnecessary annoyance. The right of search is a war right applicable to merchant vessels only in time of war, and to those suspected of piracy at any time, inasmuch as piracy involving attack on the peaceful and unarmed, is held to be war against the human race.

INTERNATIONAL WORKMEN'S ASSOCIATION, commonly known as the International, organized in 1864 at London by an assemblage of workingmen from the principal countries of Europe, is an association of trades-unions designed to protect the working-classes against the power of capitalists, and seeking to overthrow the system of paying labor with wages by substituting for it national co-operative associations. The programme and rules for its government drawn up by Dr. Carl Marx were finally adopted, in preference to those of Mazzini and Bakunin, at the first general congress,

held at Geneva, Sept., 1866. The reasons assigned for forming the association were : 1. That the emancipation of labor must be accomplished by workingmen themselves. 2. That the struggle to effect it is a struggle, not for class privileges and monopolies, but for equal rights and duties with an abrogation of class rule. 3. That the economical subjection of laborers to capitalists—who monopolize the means of labor—that is, the sources of life—lies at the foundation of servitude in all its forms, of all social unhappiness, mental inferiority and political bondage. 4. That the economical deliverance of the working classes is, therefore, the first great end which political movements ought to seek. 5. That efforts in this direction have, thus far, been unsuccessful because of the want of union among the departments of labor in each country, and among the working classes of different countries. 6. That the emancipation sought for is not a merely local or even national problem; but one which, embracing all countries where modern society exists, requires especially the co-operation of the most advanced nations. 7. That the present revival of effort among the working-classes in the principal countries of Europe, while it may animate their hope, should also warn them against a repetition of their old errors, and calls on them to consolidate immediately the various disconnected movements among themselves. Three subsequent meetings of the general congress were regularly held; but the fifth meeting, which was to have been at Paris in 1870, was prevented by the war between France and Prussia, and since that time no meeting has been held. The influence of the association has been extensive and effective. The strikes of the bronze workers in Paris, 1867, and of the builders in Geneva, 1868, were sustained and made successful by English money; and in England the power of trades-unions and of strikes was greatly increased, through the power which the association exerted in preventing the master-workmen from obtaining supplies of laborers in other lands. The movement encountered a very severe check during the Franco-Prussian war. Many of the Paris communists belonged to the association, and it defended their excesses in a pamphlet written by Marx and published by the general council at London. But while its operation is at present less public—even its visible organization having been broken up or suspended—its importance is maintained by an increased efficiency among the national unions, and by the establishment in all the principal countries, of organs for diffusing its ideas.

It is a curiously interesting fact that we owe the International to an occasion on which it would be least of all expected that such an institution would arise. That occasion was the international exhibition held in London in 1862, operating through the visit paid by French workmen, on the invitation of their English brothers. In accordance with this invitation, delegates were sent from the different French trades-unions, and these men inspected carefully the exhibits and processes displayed at Kensington, and duly reported their opinions and impressions to the labor organizations which they represented. But besides this semi-official duty, they assumed another, which appears to have been thrust upon them—perhaps innocently enough—from both sides of the channel, that of investigating the relations of English laborers to their employers, and of comparing notes as to the relative conditions of labor in the two countries. On Aug. 5, 1862, at a tavern in London, a meeting of the delegates and of English workingmen was held, which may be considered to have been the first step towards international labor organization. At this meeting an address was read by the English workingmen, which, while harmless enough in its sense and in its wording, contained the secret cause of all labor struggles, since it recited the reasons for dissatisfaction on the part of the laboring class, while it recommended international association as a remedy. The existing objectionable conditions of labor were stated to be competition, disputes as to wages, and the increasing introduction of machinery. The French delegates were not only cordially received and liberally treated by their English comrades, but, moreover, inducements were held out to certain of them to remain in England for the purpose of conference and study as to the most advantageous plan on which to organize vast strikes which should be sustained by the full power of international associated effort. In 1863, by taking advantage of a manifestation in favor of Poland, a pretext was found for a reunion, at which the organization was still further advanced. And now it needed only certain changes in the French laws to make the new society permanent and powerful. This was effected by a fortunate bill which passed the French *corps législatif* in 1864, by which coalitions were authorized in France.

On Sept. 28, 1864, at the grand international meeting at St. Martin's hall, in London, the provisional regulations of the "international association" were adopted, and these were ratified two years later, in the first congress of the Internationals, held at Geneva. Progress now became rapid in the new organization. A bureau for the receipt of subscriptions was opened in Paris, and met with general patronage on the part of the workingmen. Subordinate societies, or "groups," were formed in Germany, Switzerland, Italy, Denmark, and Belgium. Journals were established, and widely circulated, advocating the views of the international, which already began to oppose its conclusions to those of the cabinets and courts of Europe. The outbreak of the Franco-German war presented an opportunity which was not neglected. The formation of battalions of the national guard in Paris was aided by the Internationals to the extent of infusing as much of their own element into them as was practicable, with the design of corrupting that body, and employing it in the great social revolution which it was designed to precipitate.

tate. The second congress took place at Lausanne, Sept. 2, 1867; the third at Brussels, Sept. 6, 1868; the fourth at Basle, Sept. 6, 1869, and at this gathering, attended by 80 delegates, a Mr. Cameron, sent by the national labor union of the United States, claimed to represent 800,000 workingmen in the new world. In the following year, 1870, much uneasiness had begun to be felt in Europe in regard to the growing power of the International, and suits were instituted against it in France. Yet a fifth congress was to have been held in Paris in that year, but was prevented by the outbreak of the war. Incidentally, it should be noted that one of the delegates to the congress of Basle was Bakunin, a professed Russian nihilist. Twenty-nine journals advocated the principles of the International in Europe: Seven of these were published in Switzerland and Belgium, one in Italy, six in Spain, and the remainder in Germany and Holland, none being issued on French territory: one, printed in German, emanated from New York. It is believed that efforts were made on the part of the French empire to unite with the Internationals as against the *bourgeoisie*. Certain it is that Mazzini, Garibaldi, Blanqui, and Ledru-Rollin distrusted the new organization. But in the end the empire and the International were found opposed to each other, and though the government decided finally not to attack the International as a secret society, it instituted proceedings against fifteen members of the committee of the Paris bureau, on the charge of having belonged to an unauthorized society, and these were tried early in 1868, but on being condemned, were simply fined 100 francs each. The tribunal in this case declared the association dissolved, in its bureau in Paris; yet a few months later others of its committeemen were tried, condemned, and this time imprisoned for three months, in addition to being fined. The result of these trials was dissimulation on the part of the Internationals—and the institution still lived. In 1869 there came to the surface, in connection with the International, gen. Cluseret, who had been naturalized as an American citizen, and who now undertook to found in this country a journal in the interest of the order: this intention he afterwards abandoned, but claimed to have organized relations between the French and American groups. Documents discovered in the possession of members of the International tended to show the existence of a plot to promote a social revolution in Paris in the interest of the *ouvriers*, and this was, in fact, the inception of the *commune*. The names of certain of these members, who were afterwards tried on account of their membership, and escaped with light fines, appeared later among the list of the members of the *commune*, who, for two months and a half, led the concerted movement of pillage, murder, and incendiarism in the city of Paris. At the present writing there exists no evidence to show that the International has been entirely abandoned.

INTEROCEANIC SHIP CANAL. One of the greatest schemes to facilitate the commerce of the world is the project for the construction of a ship canal across the isthmus joining North and South America—a scheme which has been contemplated since an early period in the history of America. In the search for a shorter route to India, Columbus discovered land which he thought part of Asia, but the explorations of Balboa disproved this and re-presented the old problem. The isthmus was an obstacle which enterprising men thought to remove by cutting a canal. In 1528 Galvao, a Spaniard, proposed to Charles V. an artificial water-way, and the latter, in 1534, directed Cortez to locate a route, and surveys were subsequently made. Gomara suggested three routes in 1551, one via Nicaragua; and another Spaniard explored the isthmus in 1567 under the patronage of Philip II. In 1695 William Paterson projected with royal favor an expedition to colonize Darien and cut a canal across the isthmus, but the enterprise failed. A number of explorations and plans were made after this by men of different nationalities, and, in 1804, Humboldt published a discussion of the various canal routes which aroused new interest; and, as commerce increased, the importance of the problem became still more evident, and many projectors arose in the chief maritime nations.

In 1825 the Central American republic sought the co-operation of the United States in the construction of a canal via Nicaragua, and a contract was made, but the necessary capital was not subscribed. The scheme was resuscitated in 1831. Many persons have recently cited the Monroe doctrine as a reason why the canal should not be built by foreign capitalists, an objection which, in the light of the enactments of both houses of congress in 1835 and '39, constitutes a grave misapplication of the spirit of that doctrine. The more cosmopolitan views, together with liberal legislation and the Clayton-Bulwer treaty with Great Britain in 1850, favor, first, the construction of the canal by any individuals or companies willing to undertake it; secondly, the contemplation of the work as international in character; thirdly, the formation of treaties with other nations which would guarantee the perpetual neutrality of the canal. Since 1864 every part of the isthmus which appeared feasible as the route of a canal with or without locks has been explored by Americans at public or private expense, while in a number of cases all the requisite data have been collected for the estimation of length, excavations in earth and rock, tunneling, location of locks and dams, and the improvement of harbors. After a number of explorations of the isthmus by French engineers, M. Ferdinand de Lesseps, the projector of the Suez Canal, and M. Henry Bioune sent invitations to chambers of commerce and scientific societies, requesting them to send representatives to a congress to be held in Paris to discuss the various projects for piercing the

isthmus, which had been elaborated by American and French engineers. It was hoped that by these means the best route might be decided upon, and that then capital would be invested and the work vigorously prosecuted. One hundred and thirty-five engineers, statisticians, and scientists met at Paris, May 15, 1879, and formed the congress, of which M. de Lesseps was chosen president.

A short sketch will first be given of the work of the congress and the projects presented, after which a few observations will be made upon the results. Five committees were appointed:—I. The committee upon statistics, to consider the probable traffic of the canal, the tonnage, etc. In the opinion of these gentlemen a canal without locks would be profitable, while a canal with locks would not. At \$3 per ton, a minimum annual traffic of 6,000,000 tons would be necessary—equivalent to 8 ships of 2,050 tons daily—to pay ordinary dividends. They stated the probable maximum limit of the actual traffic to be 24 ships in one day, but thought a capacity of 50 ships per day desirable; 4,830,000 tons would naturally have passed through the canal in 1876, had it been built. It was calculated that the canal could be finished in 1887, and that the tonnage would aggregate 7,250,000 tons the first year. II. The committee upon economical and commercial questions considered the saving to each country in cost of transportation, the new markets which would be opened, and similar questions. The distance by water from European ports to all the ports of the Pacific ocean, from the cities on the Atlantic coasts to the cities on the Pacific coasts of America and to the vast countries on the coasts of Asia, eastern Africa, and the islands of the Pacific, would be extraordinarily shortened. It would no longer be necessary for the guano and niter of South America and the wheat of California to delay in the calms of the equinox, or to brave the storms of Cape Horn. The great vegetable and mineral resources of the Pacific South American states and of Central America would naturally be greatly developed. The larger part of the tonnage would be that of ships of the United States. III. The committee upon navigation discussed the effect of the canal upon naval architecture, the effect of currents of wind and water upon traffic and the canal, and cognate topics. They recommended that the canal should have a minimum depth of 27.2 ft., a breadth at the bottom of 82 ft., at the top of 229.6 ft., and in rock excavations a breadth at the surface of 98.4 feet. Locks should be 72.2 ft. wide and 493 ft. long, and so distributed that 50 vessels per day could pass. IV. The committee upon technical questions examined different routes, estimates of cost of building, working, maintenance, and repairs; they also considered the safety and speed of navigation in the harbors and canal. They recommended the adoption of the tide-water route without locks, extending from the gulf of Simon to the bay of Panama; this is commonly called the Panama route. V. The committee upon ways and means calculated the cost at \$120,000,000, the gross annual revenue at \$18,000,000, and the total capital required at \$150,000,000. The cost of maintenance was estimated at \$1,200,000 per annum, and a royalty of 5 per cent of the gross earnings would be due the United States of Colombia. All were in favor of the strict neutrality of the canal. At the close of the session a vote was taken upon the report of the technical committee, which was accepted with the following vote: yeas, 75; nays, 8; abstained from voting, 16; absent, 36; total, 135. Eight projects were presented to the technical committee, of which a short description is given. The width of the isthmus in the vicinity of Panama, which is the narrowest part, is 34.17 m. when measured in a straight line. The Panama railroad crosses the Cordilleras through the pass at Culebra, which is 285.4 ft. above the sea-level.

Routes via Panama.—(1.) In the opinion of Lull and Menocal, who surveyed this route in 1875, a sea-level canal would not prove profitable; but they made a project for a lock-canal. Starting from the bay of Colon, the route crosses the Chagres river at Matachin through a high aqueduct, and reaches the summit level at an elevation of 124.6 ft. above the sea. A dam extending between the rocky shores of the Chagres river would supply the canal with nearly 35,000,000 cubic ft. of water per day through a subterranean duct 13,120 ft. long. The canal crosses the Cordilleras through Culebra pass, enters the valley of the Rio Grande river, deflects to the right, and enters the harbor of Panama e. of the terminus of the Panama railroad. A new channel would be made for the Rio Grande river, and a canal to drain its eastern affluents. Thirty-eight curves, some having as short a radius as 2,493 ft., and 25 locks, would be necessary. The total excavation is estimated at 48,397,000 cubic yds., and the cost at \$96,000,000. The length would be 45.45 m., and the time of passage 2.5 days. Menocal considers the Nicaragua route more desirable than this. (2.) Messrs. Wyse and Reclus, accompanied by explorers and engineers, located a route for a sea-level canal, which follows substantially the line of the Panama railroad. It was after M. de Lesseps had been convinced of the feasibility of a tide-level canal at this point that the invitations were sent out which resulted in the Paris congress. Beginning at the town of Colon, or Aspinwall, on the bay of Simon, the canal crosses the marsh of Mindi, curves twice, and reaches the Chagres river, which it intersects several times and follows to Matachin. It then enters the valley of the Obispo, pierces the mountain through a tunnel 25,263 ft. long, occupies the Rio Grande valley, and terminates in the gulf of Panama. The length of this route is 46.6 m., and there are 13 curves. It uses the river beds the whole distance, and would drain the valleys. A lateral canal would be built at Matachin, on account of a fall of 49.2 ft., to conduct the water of the Chagres into the canal; a

number of such cuttings are necessitated by the rapids and the heavy rain-falls, which produce destructive floods. The depth of the canal at the eastern extremity is 27.9 ft. below mean tide, and at the western 23.9 ft. below the lowest neap tide. The canal is 65.6 feet wide at the bottom, expanding near the ends to 328 feet. A cross section of the tunnel is 78.7 ft. wide at mean tide, is shaped above the water like a Gothic arch, and ends in a circular arch the highest point of which is 111.5 ft. above the water. To allow vessels to pass each other, the canal will be widened at intervals of about 5.6 miles. No rise of water exceeding 19 $\frac{1}{2}$ ft. is anticipated. Sudden inundations would be prevented by dams in the upper Chagres valley, forming natural reservoirs from which the flow of water could be regulated to a considerable extent. A sea-wall 2,788 ft. long would render the bay of Simon serviceable, while a channel at the western end would be protected by walls, the material for which would be obtained by the rock-cuttings. The earth near the ends can be removed by dredging. It was calculated that it would be necessary to excavate 36,625,000 cubic yards of rock and 25,296,000 cubic yards of earth. Wyse and Reclus estimate the cost at \$95,000,000. (3.) A project for a lock-canal, presented by the same engineers, contemplated the construction of dams in the Chagres and Rio Grande rivers, forming two lakes, connected by a cutting, whose maximum depth would be 236.2 feet. This would form a plane 78.7 ft. above tide-water, 25.48 m. long, 13.66 m. from Colon, and 7.45 m. from Panama, to each of which ports the descent would be made through five locks. The calculated cost is \$85,600,000; the total excavation, 15,696,000 cubic yds.; the length, 45.36 m.; and the time of passage, 2 days.

Routes via Nicaragua.—Two projects were presented. (4.) The first was elaborated by Messrs. Lull and Menocal, and based upon surveys made in 1872-73 at the expense of the U. S. government. This plan was favored by the American representatives and by a number of French engineers, and is the route most popular among the American people. The eastern extremity is at the harbor of Greytown, and the western at the harbor of Brito. Starting from Greytown, the canal is constructed, partly by excavation and partly by dikes, on the left bank of the San Juan river to the mouth of the San Carlos, a distance of 43.5 miles. Here a dam is thrown across the San Juan, which flows through a rocky valley, producing slack-water navigation 63.38 m. to the lake of Nicaragua. This lake, situated 107 ft. above the sea-level, having a length of 109.35 m. and a breadth of 34.78 m., forms a large natural reservoir. From 50 to 60 m. of the route will be across the lake; some dredging, however, will be necessary. The western section starts from the lake near the mouth of the Rio del Medio, enters the Rio Grande river 4.97 m. from the lake, where it receives the waters of the Rio del Medio, and crosses the Rivas pass. At this point a stream called the Chicolata becomes an affluent, and finally the canal enters the valley of the Rio Grande river, and terminates near its mouth. The total length is 180 m., of which but 62 m. are artificial. A bar of sand would be removed from the mouth of the harbor at Greytown, and the deposition of silt prevented by turning the San Juan river into the Colorado. At the harbor of Brito a breakwater would be built, and a jetty to keep out the silt from the Rio Grande river. Ten locks will be required each side of the lake. The western section passes through volcanic mountains, but no great difficulty in construction is anticipated. Blasting will be necessary to form a channel at the entrance of the canal to the lake and in the Rivas pass. The dimensions proposed are: depth, 26 $\frac{1}{4}$ ft.; breadth at bottom, 71.2 ft; breadth at water-level, 150.9 ft.; and, in rock, 59.7 ft. at the bottom, and 89.9 ft. at the water-level. The total material excavated by blasting, dredging, and digging amounts to 62,700,000 cubic yds., and the total cost is calculated to be \$52,577,718, or, adding 25 per cent to cover errors and contingencies, \$65,722,147. Time required for transit, 4 $\frac{1}{2}$ days. (5.) The second project, that of M. Blanchet, is quite different from the American. The chief feature is to preserve the level of the lake throughout the major part of the San Juan river by the construction of a dam. To build the western section, he proposed to cut Guyscoyall pass, and convert the valley of the Rio Grande river into a lake by a dam at La Flor 1312 ft. long, and supporting 65.6 ft. of water. The descent to the harbor of Brito would be made by locks. The chain of two artificial lakes and one natural would have a length of 147.26 m., while the total length of the canal would be 182.4 miles. This route requires the excavation of 36,240,000 cubic yds. of earth and rock, the cost is calculated at \$72,400,000, the time at 4 $\frac{1}{2}$ days, and 14 locks must be built.

(6) *The Tehuantepec route*, submitted by M. de Garay, is located in Mexican territory, and connects the bay of Vera Cruz with the gulf of Tehuantepec. The land is level and low, except a narrow ridge of the Cordilleras on the Pacific coast. The water from a number of large streams would be utilized. The dimensions proposed would not admit of the passage of the largest ships. The length would be 174 m.; the time of passage, 12 days. One hundred and twenty locks would be necessary. (7) *The Atrato-Napipi route*, surveyed by Selfridge and Collins, starts from the gulf of Darien and passes up the Atrato river at its level to the mouth of the Napipi, a distance of 149 miles. The minimum depth of the river is 25.6 feet. From this point the air-line distance to the bay of Chiri-Chiri is 27.95 miles. Dredging would be done for 5.6 m. in the Napipi river, under which the canal afterwards passes by means of a tunnel; it terminates in a basin 18.7 ft. above mean tide after passing through 5.6 m. of tunnel in the mountains near the Pacific. Two locks connect the basin with the bay of Chiri-

Chiri, and jetties must be built and bars cut through in the harbors. The cost is estimated at \$98,200,000, the time of passage at three days, and the total length at 180 miles. (8) *The San Blas route* was explored by McDougal in 1864, at the expense of Mr. Kelley, of Philadelphia, and was afterwards surveyed by Selfridge. At this point, the narrowest part of the isthmus, the width is but 31 miles. A tide-level canal is impracticable, owing to the height of the Cordilleras and the location of the streams. Upon the authority of Wyse and Recius, the length of the canal would be 32.9 m., and about 10 out of the 24.85 m. of excavation would be tunneling. An excavation of 44,473,000 cubic yds. would be required, at a cost of \$95,000,000, while the passage would take one day, and there would be one sea-lock. In addition to the plans outlined above, which were the more important ones presented to the congress, a number of modifications of them, as well as independent routes, have been proposed. In a paper read before the society of arts, London, capt. Bedford Pim, R.N., M.P.—a gentleman who has passed through Nicaragua six times, and surveyed the major part of both coast-lines of the isthmus—pronounces the improvement of the harbor at Greytown the most difficult part of the work on the Nicaragua route. The entrance to the harbor is alternately choked up with sand by a storm, and opened by a flood in the San Juan river. To avoid this harbor, which he thinks would "completely swamp the enterprise," he proposes a route starting from Pim's bay, 40 m. n. of Greytown, and ending at the port of Realejo, on the Pacific. This route would be 290 m. long, and would include 85 m. of navigation on the lake of Nicaragua and 40 m. on lake Managua. The chief feature of the plan is the proposal to make the depth of the canal only 8 ft., and to transport the vessels upon "pontoons by the process which has been successfully used in the Victoria docks (London) for years." He suggests that a railroad should first be built connecting with steamboats on the lakes as an auxiliary to the construction, and as liable to afford a valuable knowledge of the district. The captain estimates the cost at an average of about \$100,000 per mile, or a total of \$30,000,000, and proposes that the governments of England, France, and the United States should each guarantee one per cent upon the capital, and that a five-acre plot of land should be given with each \$50 share.

Speaking of the *personnel* of the congress, a gentleman well known in Paris wrote: "Let it be remembered that one-half of the congress were French; they had been chosen by the organizers of that assembly; 34 members belonged to the geographical or the commercial geographical society of Paris. What was their competency to decide between a canal with locks or on a sea-level? Fourteen other members were engineers or assistants of some sort on the Suez canal. What was their impartiality between M. de Lesseps and others? And, among the others, if one takes account of personal friendships and of the prestige exercised by a great name, how many more will remain?" Capt. Pim says, "The selection of a route for the proposed canal seems to have been a foregone conclusion." The parties most interested in the canal are the American states and England. England sent no official representative, but gave sir John Stokes permission to attend. The United States looked upon the congress as a meeting of capable specialists convened to discuss a matter of paramount importance, and, with this in view, appointed rear-admiral Daniel Ammen and Anecito G. Menocal, civil engineer in the U. S. navy, commissioners to represent the government officially, and placed at their disposal all relevant reports and papers which had been prepared by government officers. They had "no official powers or diplomatic functions," and no authority to state what action would be taken by their government. Commissioner Ammen abstained from voting, upon the ground that "only able engineers can form an opinion after careful study of what is actually possible, and what is relatively economical in the construction of a ship canal." At present, whatever may be the opinion of the advocates of other schemes, there appear to be two strong parties: first, those favoring a tide-level canal viâ Panama; and, second, those favoring the lock canal viâ Nicaragua, projected by Lull and Menocal. M. de Lesseps says an hour and a half were required for a steamer to pass through a lock which was a "vast improvement" upon older ones; therefore locks would limit the traffic of the Nicaragua canal, and render it unprofitable. Rear-admiral Ammen states that a lock 515 ft. long, 60 ft. wide, and having a lift of 18 ft., is being built at St. Mary's, Mich., through which, it is computed, a steamer will pass in 11 minutes. M. de Lesseps thinks earthquakes would injure the locks. Admiral Ammen thinks, upon the evidence of ruined archways, that the result would not be serious, while the locks would be so constructed as to allow repairs to be made in the minimum time, and, save in four instances, without drawing the water from the canal. Eminent scientists and engineers have made objections to the Panama route, some of which they consider serious and irremediable. Commodore M. F. Maury, LL.D., author of a work upon physical geography, and Maury's *Sailing Directions*, says: "If nature, by one of her convulsions, should rend the continent of America in twain, and make a channel across the isthmus of Panama or Darien as deep and as wide and as free as the straits of Dover, it would never become a commercial thoroughfare for sailing-vessels." He also states that vessels going to or from Panama have been detained by calms for months at a time. This same great belt of calms covers all of the isthmus s. of Panama, while its effect at the mouth of the Atrato is still more vexatious! The fact that the Panama railroad has not diverted sailing-vessels from their old route around cape Horn, confirms the above. Only one-third of the foreign commerce

of England is carried on in steamships, and their increase is less rapid than that of sailing-vessels, so that a large part of the shipping of the world would be excluded. The heavy rainfall of the Chagres valley culminated in a flood in Nov., 1879, which damaged the Panama railroad to such an extent as to cause the suspension of traffic for two or three months. Such a flood would probably have done much injury to the canal had it existed. Panama affords no materials for construction, inferior facilities for obtaining supplies and labor, has a dry season of but two or three months, and is one of the unhealthiest regions in the world. On the other hand, Nicaragua contains good building material, ample supplies, a population from which many laborers could be recruited, and it has a dry season of five or six months. It is far more healthy, especially west of the lake. The Panama route would cost \$94,511,360; the Nicaragua, \$65,722,137; the former would draw little or no support from the region through which it passes, while the latter would develop a country rich in the productions of the three kingdoms of nature. The concession for the Panama route granted by the United States of Colombia is controlled by M. de Lesseps, who organized a company and opened books in Europe and America to receive subscriptions. Some steps have been taken in America to organize the Nicaragua canal company, the presidency of which was offered to gen. U. S. Grant by admiral Ammen. Mr. Joseph Nimmo, chief of the bureau of statistics, thinks the present commerce insufficient to support the canal. Whether this be true or not, the question is one not of desirability nor of feasibility, but one of the time when to build, and of its safety as a financial investment.

INTEROCEANIC SHIP RAILWAY. Capt. James B. Eads, the projector of a railway across the American isthmus for transporting ships, presented the essential features of his plan to the canal committee of the house of representatives in March, 1880. Of its kind, the scheme is in many respects more ambitious than any heretofore proposed. The engineering and financial success achieved by capt. Eads in the construction of the St. Louis bridge, and the jetties at the mouth of the Mississippi river, demands a careful consideration of projects which he may advocate. The proposed railway is to consist of twelve tracks, placed 4 or 5 ft. apart, upon which the ship carriage, or cradle, runs. At each terminus an inland basin is excavated, perpendicular to the shore line of the harbor, and 3,000 ft. long. Gates placed at the outer end of the basin, which is lined with masonry, make it possible to pump out the water when repairs are necessary. The track in the basin is 30 ft. below water-level at the harbor end, and, rising 1 ft. in 100, intersects the surface level at the other extremity. The dimensions of cradles will be adapted to the size of vessel transported. The largest merchant ships weigh, when loaded, about 6,000 tons. This weight will be distributed over 1200 wheels, making the pressure 5 tons upon a single wheel which could support 20—a pressure ordinarily exceeded in practice, as the driving-wheels of many locomotives must sustain $6\frac{1}{2}$ tons.

A ship to be transported enters the harbor end of the basin, and is floated to where her keel is over the keel-block of the cradle, then the supports are adjusted under the bilges substantially as in a dry dock. The weight rests chiefly upon the keel, while a part is distributed over the bilge blocks, which also keep the ship in an upright position. A stationary engine hauls the cradle and ship out of the water, and then two very powerful locomotives are attached, which draw their great load to the other terminus, at a speed of ten or twelve miles an hour. The locomotives are to have five times the size and power of freight engines, and with their tenders will use all twelve tracks. The wheels have double flanges, and as their number is great, the rails and road-bed sustain but a moderate pressure, and the failure of one or several wheels would not be serious. Derailment is impossible, and the displacement or breakage of rails would cause no delay, as six of them would bear the entire weight. Above each wheel are two strong steel springs, which diminish the strain, and each wheel can be removed separately by loosening two bolts. Cars would pass each other by means of transfer tables, which would move the cradles sideways. One of the chief arguments against this plan is that loaded ships will not endure the strains imposed upon them when out of water, and supported only at intervals. The assumption that the mobility of water equalizes the strain is not correct, as it is common in rough weather for the whole weight of a ship and cargo to bear upon the ends or the middle, leaving the remainder of the ship unsupported; indeed, a gale subjects a ship to very severe torsional and lateral strains, which change constantly in direction and intensity—strains far exceeding any which would be incurred on the railway. Farther evidence upon this point is furnished by the portage railroad of the Alleghany mountains, which, forty years ago, connected the canal systems of eastern and western Pennsylvania. Over this railroad loaded canal-boats—frail craft compared with sea-going vessels—were hauled for a distance of over 30 m. up and down steep inclines. Many experienced ship-builders consider ship transportation by rail feasible, and, compared with ship canals, economical. Thus it will be seen that this project involves only the combination upon a large scale of a number of well-tried engineering expedients.

Routes could probably be located at Panama, Nicaragua, and Tehuantepec, with a grade of 30 or 40 ft. to the mile. Capt. Eads estimates the cost of a road and harbor at Panama at \$50,000,000, and the route is, perhaps, the shortest that could be found, but

expensive harbor improvements would be required. The Chiriqui route has steeper grades, but superior natural harbors. The Panama route would probably exclude the transportation of vessels without steam-power. See **INTEROCEANIC SHIP CANAL**. Mr. Eads believes "that upon any route where it is possible to build a canal, it is equally possible to build and equip a substantial and durable ship railway;" that a railway is practicable where a canal is not; that the elements of cost, time of construction, speed in transit, capacity, and cost of maintenance and operating, are all heavily in favor of the railway; that the capacity of the railway could be increased at any time to transport more or larger ships with no interruption of traffic; that more accurate estimates can be made of the cost of a railway and the time of completion than of a canal, as the latter requires sub-aqueous work, where the conditions are more variable, and that, therefore, capitalists will have more confidence in the railway. It is estimated that the railway could be duplicated once in ten years for the interest on the difference between the cost of a canal and a railway of equal capacity. A traffic of 5,000,000 tons yearly, at \$2 per ton, would give an income of \$10,000,000, which, deducting 50 per cent for expenses, would leave a dividend of 10 per cent upon the capital.

INTERPLEADER SUIT was till recently brought only in the court of chancery to determine which of several parties claiming the same thing is entitled. Formerly, there was no analogous process in courts of common law whereby several parties claiming one thing could be brought into the field, but in 1831 a statute gave power to do this to a limited extent. By the judicature act of 1875, the interpleader acts are applicable to all actions in the high court. See **MULTIPLEPOINDING**.

INTERPOLATION, the insertion of a word, line, verse, sentence, part of a sentence, or whole passage, generally with a view to secure respect for some opinion by the apparent support of antiquity, or of those whose authority is greatest. Many instances of interpolation are well known, and others are with great probability suspected, in which the works of early Christian writers have been tampered with, to make them yield support to novel doctrines and practices.—In mathematics, interpolation is the insertion between two members of a series increasing according to a certain law, of other members such as, if not absolutely, yet very nearly, may accord with the same law.

INTERPRETATION, in law, is the judicial exposition of the meaning of constitutions, treaties, statutes, contracts, wills, and other papers, or parts of the same, that affect the rights of parties to any action in a court of justice. It often happens that a suit is determined by the interpretation of written words or phrases of doubtful meaning, so that courts in exercising their powers in this respect incur a very high responsibility, which is all the greater from the impossibility of reducing interpretation to an exact science under rigid rules. It is necessary that courts should not only have a clear understanding of the general meaning of words and of their application to the matters in hand, but also that they should be able impartially to weigh the whole environment of the cases upon which they are to pass an authoritative judgment, and at the same time cherish an earnest purpose to do exact justice to the parties. Their duty sometimes involves the necessity for very nice, not to say ingenious, discriminations, which tax alike their judgment and conscience. In regard to many things their task has been made easy by well settled rules and a long line of precedents; but new questions often arise, upon which precedents are to be made rather than followed. It sometimes happens, from a lack of skill in composition, that a single passage, taken by itself, is partially or wholly incompatible with the manifest spirit and intent of a legal document. In such cases courts will exercise a large discretion, in order, if reasonably possible, to make the instrument consistent in itself. Every written paper necessarily assumes the existence of facts or incidents that are either not expressed at all, or expressed only by implication, and that must be considered before the exact meaning can be determined. An incompetent or unscrupulous judge might do a great wrong by a too close adherence to a particular part of an instrument while failing to give due weight to its spirit and purpose as a whole. Particular words and phrases must be considered in their relations to the context and to the subject matter, not torn from their connection and interpreted by themselves in such a way as to defeat the manifest intent of the instrument. Oral evidence cannot vary the terms of a written document, which must be considered as a whole. Courts are not at liberty to supply by interpretation the unexpressed intent of a legislature, testator, or contractor. The interpretation must be made in good faith and be in accord with good sense and the common understanding of language, not forced or strained to support a theory fatal to the document itself. Inadvertent errors or omissions will be overlooked, and mistakes in orthography and grammar will be lightly regarded where the meaning is clear. It is a general rule that the words of a statute are to be taken in their ordinary sense; but if the statute relates to a particular subject or class of persons, and requires the use of terms not generally familiar, their meaning will be determined by the prevailing usage in regard to the subject. The will of a legislature cannot be judicially conjectured. Penal statutes, in deference to the recognized rights of accused persons, are construed with great strictness; courts will not enlarge their scope by strained interpretations even to punish persons of whose guilt they have no moral doubt.

INTERVAL, in music, is the difference of pitch between sounds in respect to height or depth, or the distance on the stave from one note to another, in opposition to the unison, which is two sounds exactly of the same pitch. From the nature of our system of musical notation, which is on five lines and the four intervening spaces, and from the notes of the scale being named by the first seven letters of the alphabet, with repetitions in every octave, it follows that there can only be six different intervals in the natural diatonic scale until the octave of the unison be attained. To reckon from C upwards, we find the following intervals; thus C to D is a second; C to E is a third; C to F is a fourth; C to G, a fifth; C to A, a sixth; C to B, a seventh; and from C to C is the octave, or the beginning of a similar series. Intervals above the octave are therefore merely a repetition of those an octave lower; thus from C to D above the octave, although sometimes necessarily call a ninth, is neither more nor less than the same interval which, at an octave lower, is termed the second. A flat or a sharp placed before either of the notes of an interval does not alter the name of the interval, although it affects its quality; for example, from C to G \sharp is still a fifth, notwithstanding that the G is raised a semitone by the sharp. Intervals are classified as perfect, major, and minor. Perfect intervals are those which admit of no change whatever without destroying their consonance; these are the fourth, fifth, and the octave. Intervals which admit of being raised or lowered a semitone, and are still consonant, are distinguished by the term *major* or *minor*, according as the distance between the notes of the interval is large or small. Such intervals are the third and sixth; for example, from C to E is a major third, the consonance being in the proportion of 5 to 4; when the E is lowered a semitone by a flat, the interval is still consonant, but in the proportion of 6 to 5, and is called a minor third. The same description applies to the interval of the sixth from C to A, and from C to A \flat . The second and seventh, though reckoned as dissonances, are also distinguished as major and minor. The terms "extreme sharp" and "diminished" are applied to intervals when they are still further elevated or depressed by a sharp or a flat. For the mathematical proportions of intervals, see HARMONICS.

INTESTACY, the state of a person who has died without leaving a will. Every person in the United Kingdom has the right, as one of the incidents of ownership, of regulating the succession of his property after his death; that is, of executing a will which must comply with certain requisites, so as to show that it was solemnly and deliberately made, by which will the owner can give his property to whomsoever he pleases. The forms in Scotland differ from those in England and Ireland, and there is some restriction on the right of testing or bequeathing property, but in all places the principle is, that if no will, or deed equivalent to a will, is executed, or, if a will executed is invalid from defect of form, then an intestacy occurs, and the law provides an heir or next of kin, in lieu of the owner himself doing so. See HEIR; SUCCESSION; WILL. A person may die partially intestate, for his will may have included only some of his property, in which case the property not so included goes to the heir-at-law, or next of kin, according as it is real or personal estate, as if no will had been made. But it is often a difficult question in construing the will, whether the property not specially mentioned was not conveyed by general words to the residuary legatee or devisee—a question which turns entirely on the language used in each case.

INTESTINES. See DIGESTION, ORGANS AND PROCESS OF.

INTONING, according to the general use of the word, is the recitative form of offering prayer. Intoning differs from ordinary reading in having fewer inflections of the voice, and these only at stated parts of the prayers, and according to certain rules. The greater part of the prayer is recited on one note, the last two or three words being sung to the proximate notes of the scale. In the longer prayers, the terminal inflection is generally omitted. The words intoning and chanting are sometimes used interchangeably, but, though there is ground common to both, each has a domain peculiar to itself. Intoning may be defined as ecclesiastical recitative, and when several voices are employed in its performance, they sing, for the most part, in unison, breaking into harmony at the termination of the clause or sentence. Chanting embraces recitative and rhythm, both divisions being in continuous harmony. In the Anglican service, as performed in cathedral churches, all those parts of the ritual, speaking generally, which are not set to rhythmical music, are intoned; these embrace that part of the morning and evening service which precedes the daily psalms, the litany, and the prayers in general.

John Marbeck (1550) was the first in England to adapt the offices of the reformed church to music; his work contained melody only. He was followed by Thomas Tallis, who flourished during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. The grave melody (founded on the ancient usage) and sublime harmonies of Tallis have never been equaled, and have continued in use till the present day with but slight modification. Tallis seems to have invented the form of the Anglican chant now used for the psalms. In the Roman Catholic church these are sung to the Gregorian tones. See GREGORIAN CHANT. The canticles are sung to rhythmical music of a more elaborated character, in which form they are technically named "services." The lessons, previous to the last review (1661) of the *Book of Common Prayer*, were intoned; since then, the invariable practice has been to read them.

The practice of intoning existed among the Jews at a very early period, and there is great probability that the ecclesiastical chant in present use throughout Christendom is but a modification of that which formed part of the ancient Jewish ritual. The eastern and western churches, at variance on most points, are at one on this. Mohammedans also make use of this mode of prayer; and barbarous tribes (American Indians and South Sea islanders) are wont to propitiate their false gods in a species of rude chant; all which seems to point to some deeply-seated instinct of human nature, and to indicate an intuitive perception of the truth, that a solemn and reverential manner, distinct from his manner of ordinary intercourse with his fellows, best befits the creature in his approaches to the Creator. The Lutheran church and the church of England have continued the practice, though only to a permissive and non-essential extent. The latter uses it in her cathedral and collegiate churches, and in these vast edifices its advantages over reading are strikingly manifest.

INTOXICATION. Whether induced by fermented liquors or by distilled spirits, it is through the alcohol contained in either that the effects of intoxication ensue. These may be considered under two heads: 1. As they immediately manifest themselves during a single act of intoxication; and, 2. As they gradually arise through the frequent repetition of the act. The one refers to the state of drunkenness simply, the other to the habit (intemperance).

The effects of alcohol, in a single act of intoxication, vary according to the way in which the spirit has been taken. If swallowed rapidly, in large quantities or in a concentrated form, the agency is that of a powerful narcotic poison. The mode of action here is partly through a direct impression by the alcohol on the nerves of the stomach, and partly by its absorption into the blood, and its transmission thus to the brain, which is proved to take place with great rapidity. The individual falls into a deep stupor, from which it is impossible to rouse him. The face is ordinarily livid, with a swollen aspect, but sometimes it is ghastly pale. The skin is covered with chilly damps; the pulse is feeble, or perhaps wholly imperceptible, the breathing is slow and weak, though sometimes laborious and snorting; the eyes are rolled upwards, with contracted, or occasionally, dilated pupils; the jaws are clenched, and there are frequently convulsions. Where death follows, it may ensue in a few minutes, or after a period varying from a single hour to a day. Where the quantity taken is swallowed more slowly, as in ordinary drinking, the consequences are those which are too familiarly known as characterizing a fit of drunkenness, and are the product of the more gradual and less excessive absorption. The first effect is that of a feeling of wellbeing, diffused over the body, and imparted to the mind. This gradually leads to a state of exhilaration, and thence to boisterous mirth and loquacity, attended at first by a swift transition and vivacity of the ideas, but speedily lapsing into indistinctness and confusion. In the increasing whirl of excitement, the individual loses all sense of prudence and self-government, betrays himself by his indiscretions, provokes pity and ridicule by his follies, or incurs danger by his recklessness. Along with this mental condition, the flushed face, flashing eye, and throbbing brain show, at first, the corresponding state of excitement of the bodily functions; while, along with the subsequent confusion of thought, the reeling gait and the look of stolid incomprehension denote the intrailment that has followed. In a further stage, the memory fails, the individual maulders and mumbles in his speech, and the surrounding objects, recently seen imperfectly and misapprehended, wholly cease to impress him. At length, amid other loathsome concomitants, he sinks powerless, and stupor intervenes, from which he again awakens to consciousness after an indefinite number of hours; but then usually to suffer from qualms of sickness and other feelings of pain and depression, entailed upon him by a natural law as the reaction from his excess, and only dispelled after a still longer interval. The outline of the effects may vary. With some, the progress of a fit of drunkenness is never attended by hilarity or other conspicuous excitement, and a dreamy and subdued forgetfulness seems all that is produced or that is sought for. With some, even, it leads to a state of querulousness or of unreasoning melancholy. With others, the condition is one of furious madness, hesitating before no extreme of violence and outrage.

It is chiefly to the after-effects of the paroxysm that we are to trace the original growth and ultimate inveteracy of the drunken habit. The uneasy sensations of depression, following upon the excitement of the previous debauch, are sought to be relieved by a fresh recurrence to the stimulant; and a morbid appetite is thus created which craves its relief, and finds it, in the renewed administration of spirituous drinks, just as the natural appetite of hunger develops those sharp disquietudes that are allayed by food. This morbid appetite, in so far as it is morbid, may in itself be regarded and treated as a disease. But the universal health shows ultimately signs of a more deep injury. The cheeks begin to have a bloated and flabby look, with a complexion that either wears a peculiar pallor, or verges into shades of purple, while the nose not rarely presents a suspicious tinge of crimson. The appetite for ordinary food fails, the digestion is impaired, the sleep is disturbed, and the vigor of frame and capacity for exertion sink accordingly, the limbs often aching and trembling, and the heart drooping with a miserable feeling of nervous exhaustion. Even prior to this, the drunkard is often liable to those minor illusions which end in the full development of what is known as the drunkard's delirium,

or *delirium tremens*, a form of temporary insanity characterized by a state of abject terror, with shaking of the limbs, the sufferer fancying that he is surrounded with monstrous phantasms, or that he is devoted otherwise to horrors, disasters, or crimes. One effect, and a leading one, of the customary presence of alcohol in the blood of the drinker, is to reduce the vitality of that fluid, so that it tends to sustain only the lowest forms of nutrition and animalization, and deposits, in great part, merely an inert fat within those organs where it should minister to the growth and maintenance of a delicate construction, destined for uses essential to life. Thus we have fatty deposits, or changes of higher structures into fat, in the heart, the liver, and in the blood-vessels, the coats of the last becoming easily ruptured. Hence, liability to diseases of the heart and of the liver often followed by dropsies, or to affections of the other intestines, or to attacks of apoplexy and palsy. If not cut off abruptly in his career, the life of the drunkard becomes one long malady towards its close, the final condition being usually one of imbecility of mind and body, yet with throes of suffering to the last. It has been authoritatively shown that, while the average expectation of future life to the temperate man at 50 may be reckoned at 20 years, that of the drunkard at the same age is only four years. Again, between the ages of 21 and 30, the deaths among drunkards have been found to be more than five times, and between 31 and 50, more than four times what occur among the general community at the like ages. See DIPSOMANIA and DELIRIUM TREMENS.

INTOXICATION, or DRUNKENNESS, is, in point of law, no excuse for any wrong done by the drunken party. Crimes which are committed in a state of drunkenness are punishable in the same way as if the actor were sober, though it is discretionary in the court to mitigate the sentence. As regards contracts entered into by a drunken party, there is no peculiarity, unless the fact of drunkenness was taken advantage of by the sober party, in which case it lies on the drunken party to prove this. Cases may no doubt arise where the drunkenness may be an element of fraud, and so the contract or deed may be rescinded or set aside. The mere act or state of drunkenness, when privately indulged in, is not an offense against the law; but if it be shown in public, it may become so. If, for example, a person be drunk in the streets or a public place, he was made, by a statute of James I., liable to be fined 5s., or, if unable to pay, to be committed to the stocks for six hours. By a more modern enactment of 1872, called the intoxicating liquors licensing act, which repealed the older statute, every person found drunk in a highway or public place, or in a licensed house, is liable to a penalty of 10s.: and on a second offense within 12 months, to 20s., and on a third offense within 12 months, to 40s. To be drunk and riotous, or be druuk while in charge of a horse or carriage, or of a gun, is punishable with a fine of 20s., or imprisonment for one month. Local acts also often impose other penalties. In Scotland several ancient statutes were passed against drunkenness, which, however, are in desuetude. In several local police acts a penalty is imposed on drunkenness in the streets, and the police and improvement act of Scotland, 25 and 26 Vict. c. 101, s. 254, subjects drunken persons in the streets to a penalty of 40s., or 14 days' imprisonment, in all places where that act is adopted.

INTRA'DOS, the under or inner side or soffit of an arch (q.v.), the upper or outer curve being called the *extrados*.

INTRASIGENTES, the name of a political party in Spain, comprising the extreme radical republicans. The federal republic having been declared June 8, 1873, they combined with the internationals in a communistic movement, which broke out in insurrection in several cities at once. Cartagena was held by them from July, 1873, until Jan., 1874, when it was surrendered. These troubles brought about the restoration of Serrano to the executive government, and led up to the proclamation of Alfonso XII. as king of Spain.

INTRENCHMENT, in a general sense, is any work, consisting of not less than a parapet and a ditch, which fortifies a post against the attack of an enemy. As a means of prolonging the defense in a regular work of permanent fortification, intrenchments are made in various parts, to which the defenders successively retire when driven in from forward works. Bastions are ordinarily intrenched at the gorge by a breastwork and ditch, forming either a re-entering angle or a small front of fortification. Such a work across the gorge of the Redan at Sebastopol caused the repulse of the British attack in Sept., 1855. A cavalier, with a ditch, is also an intrenchment. An army in the field often strengthens its position by intrenchments, as by a *continued line* of parapet and ditch, broken into redans and curtains, or by a *line with intervals*, consisting of detached works of more or less pretension flanking each other.

INTRENCHMENT (*ante*). See FORTIFICATION, *ante*.

INTRODUCTION (Ital. *introduzione*), in music, is a kind of preface or prelude to a following movement. Formerly, the introduction was only to be found in large musical works, such as symphonies, overtures, oratorias, etc.; but now it is found in every rondo, fantasia, polonaise, waltz, etc., on the principle that it is considered abrupt to begin all at once, without preparing the audience for what is to come. In a stricter sense, introduction is applied to the piece of music with which an opera begins, and which imme-

diately follows the overture. In some cases, the overture and introduction are united, the composition going on without any formal pause, as in Gluck's *Iphigénie en Tauride*, Mozart's *Idomeneo* and *Don Giovanni*. As the overture, which contains a harmonical sketch of the opera, should make a permanent impression on the audience, the custom of uniting it with the introduction has very properly been discontinued, and the introduction treated as an independent movement.

INTROMISSION, in Scotch law, is the assumption of legal authority to deal with another's property. It is divided into legal and vicious. Legal intromission is where the party is expressly or impliedly authorized, either by adjudgment or deed, to interfere, as by drawing the rents or getting in debts. Vicious intromission is where an heir or next of kin, without any authority, interferes with a deceased person's estate; as, for example, where a person not named by a will, or without the authority of any will, collects the property of the deceased person, as if he were regularly appointed. By so doing, the vicious intromitter incurs the responsibility of paying all the debts of the deceased. The vitiosity, however, may be taken off by the intromitter being regularly confirmed executor. The corresponding phrase in England to a vicious intromitter is an *executor de son tort*.

INTRUSION, the Scotch law-term for a trespass on lands.

INTUITION. See INSTINCT, and COMMON SENSE.

INTUS-SUSCEPTION, or INVAGINATION, is the term applied to that partial displacement of the bowel in which one portion of it passes into the portion immediately adjacent to it, just as one part of the finger of a glove is sometimes pulled into an adjacent part in the act of withdrawing the hand. In this case, the contained portion of intestine is liable to be nipped and strangulated by the portion which contains it, and all the danger of hernia (q. v.) results, with far less chance of successful interference on the part of the surgeon or physician. It is one of the most frequent and fatal causes of obstruction of the bowels. The extent of the intus-susception may vary from a few lines to a foot or more. Even when inflammation is set up, the affection, although in the highest degree perilous, is not of necessity fatal. The invaginated portion mortifies and sloughs, while adhesion is established between the peritoneal surfaces of the upper and lower portions at their place of junction, so that the continuity of the tube is preserved, although a large portion may be destroyed. If the patient is strong enough to bear the shock of the inflammation, gangrene, sloughing, etc., a complete recovery ensues.

INULIN. See ELECAMPANE.

INUNDATIONS AND FLOODS are produced by the overflow of the ocean or of rivers. To these the low countries adjacent to the sea or rivers are liable. Holland, many of whose cities and fields are upon ground snatched from the ocean, presents the most frequent scene of these calamities. In the year 860 A.D., the sea rose and swept over a portion of the Netherlands, carrying with it vast tracts of land, and changing the very shape of the coast. In 1014 a large part of the Netherlands and England, and in 1134 a part of Flanders, were submerged. In 1164 a part of Friesland and the lowlands of the Elbe and Weser were inundated. On All Saints' day in 1170 the northern part of Holland was visited with a flood so terrific that miles of country were swallowed up by the encroaching sea, and exactly to a day 400 years later the south of Holland was ravaged by the waves, so that Antwerp, Bruges, Hamburg, Rotterdam, and Amsterdam were submerged, and 30,000 people perished. In 1277 an inundation from the sea destroyed 44 villages; in 1287 by another 80,000 persons were drowned, and the Zuyder Zee received its present form and extent. In the 15th c. it is said that 100,000 were destroyed through the imperfection of dikes. In 1362 a flood destroyed 30 villages on the east of Nordstrand. The St. Elizabeth flood of 1377 swept away 72 villages, laid desolate 50 m. of territory, and altered the course of both the Maas and Rhine. By the formation of dunes and an elaborate system of dikes the Dutch have succeeded of late years in keeping the restless invader at bay, and thus avoiding a national calamity. But while the dunes have done much to save the Netherlands from great loss, yet these would have afforded but a partial barrier without dikes. When dikes were first used is not known. In the 7th c. Friesland was diked by king Adgillus, and in the 8th c. Zealand by the Danes and Goths. When Spain ruled Holland, the dikes, not being kept in good condition, the engineer Caspar de Robles, governor of Friesland, compelled the people to repair them, and set his own soldiers to work.

Other countries besides Holland have suffered from the encroachments of the ocean. England, notwithstanding her barrier of high cliffs, has been the victim of several inundations. In 1607 the greater part of south Devonshire and the neighboring countries of Dorset and Cornwall were deluged by a sea-flood that caused a fearful loss of life and property. Denmark too, in 1634, was visited with an inundation, when the sea with a mighty sweep which reached even Bremen, Hamburg, and Oldenburg, poured over the villages of the Nordland, destroying more than 20,000 human beings and 150,000 cattle. In 1717 the waters overflowed the northern coast, and ruined an immense number of buildings. In 1825 the waters rose to a great height, the flood being ascribed to an earthquake.

The floods from rivers are sometimes beneficial, as, for instance, those of the Nile,

which fertilize with their deposit the alluvial plains. But for the most part they are destructive, and those of modern times have been more disastrous than earlier ones. The direct cause of river-floods is the discharge of water into the channels more rapidly than it is carried off. The most effectual remedy against these disasters is high and solid dikes, though even these are sometimes unavailing. In 1829 an inundation occurred at Dantzig, occasioned by the Vistula breaking through its dikes, when 4,000 houses were destroyed, many lives lost, and 10,000 cattle perished. In France, Oct. 31 to Nov. 4, the Saone poured its waters into the Rhone, broke through its banks, covered 60,000 acres, and inundated several cities and towns. The Saone had not risen so high for 238 years. May 12, 1849, there was an inundation of the Mississippi at New Orleans, when 160 squares and 1600 houses were flooded. At different times the inundations of the Ohio, Mississippi, and other rivers have destroyed much property and many lives. The most destructive inundation of modern times is that which occurred in Hungary, March 12, 1879. Szegedin, the second commercial town in Hungary, was nearly destroyed by the bursting of the dikes of the river Theiss. The first intimation of the coming calamity was given Monday, March 10, when two of the three dams protecting the town gave way, and Dorozsma near Szegedin, containing 400 houses, was totally destroyed. Though 5,000 men were immediately set to work on the remaining embankment, two days later it burst, and the waters, aided by a gale, rushed forth with terrific violence, carrying away part of the railway station and rolling-stock, and flooding the town with many feet of water. Two-thirds of the town were submerged, including the citadel, the post and telegraph offices; and whole rows of houses fell. The synagogue fell in, crushing many who had sought refuge in it, and the inmates of the orphanage were buried in its ruins. Two manufactories were burned. To add to the horrors of the scene the city was in darkness, the gas-works being 15 ft. in the water; 80,000 people were houseless, and from 4,000 to 6,000 supposed to have been drowned. Of 9,700 houses all but 261 were destroyed. A hundred square miles in the neighborhood of Szegedin were flooded and the crops of the district lost. So sudden and violent was the flood that, instead of five or six hours which it was calculated the flood would take to spread through the town, scarcely an hour and a half had passed before Szegedin was submerged. The poorer classes were extremely unwilling to leave their homes, and in many cases force was necessary for their removal. Thousands suffered for want of food, and sickness broke out among the refugees encamped on the dikes.

INUUS, or *Innuus*, a genus of apes, to which the Barbary ape (q.v.) belongs. The Barbary ape is *I. sylvanus*.

INVALIDES, wounded veterans of the French army, maintained at the expense of the state. The *Hôtel des Invalides* is an establishment in Paris where a number of these old soldiers are quartered. Its chapel contains the tomb of the great Napoleon, and is an object of much attraction to all visitors. It was founded by Louis XIV. in 1671, and during his reign and for a long time afterwards was a place of retirement for the aged servants of court favorites as well as for invalided soldiers; but this abuse was put an end to by St. Germain in Louis XV.'s reign. In 1789 the hôtel had a revenue of £68,000, but during the time of the republic its property was alienated and the institution supported from the public revenue. The hôtel can accommodate 5,000 men, and the actual number of inmates is not much below this.

INVALID'ING signifies the return home or to a more healthy climate, of soldiers or sailors whom wounds or the severity of foreign service has rendered incapable of active duty. The man invalided returns to his duty as soon as his restored health justifies the step.

INVARIABLE PLANE. The position of a point in space is determined—as explained in the article CO-ORDINATES—by referring it to planes intersecting one another at right angles; and in ascertaining the motion of the point by this means, the planes must either be immovable or allowance must be made for their altered position, an operation of considerable complexity. In astronomy none of the obviously marked planes, such as that of the ecliptic (q.v.) or of the equator (q.v.), possess this requisite quality of fixity so as to form a convenient basis for determining the position of heavenly bodies with absolute exactness. Laplace, therefore, conferred a boon on astronomy, when he discovered that in the solar system there does exist “an invariable plane, about which the orbits perpetually oscillate, deviating from it only to a very small extent on either side. This plane passes through the center of gravity of the solar system, and it is so situated that if all the planets be projected on it, and if the mass of each planet be multiplied into the area, corresponding to any given time which is described by the projected radius vector, the sum of such products will be a maximum. By means of this property, which is independent of any particular epoch, it will be easy for astronomers in future ages to determine the exact position of the plane, and to compare observations together by means of it” (*Grant's History of Physical Astronomy*). Such a plane is not peculiar to the solar system, but must exist in all systems where the bodies are acted on by no other force than their mutual attraction. See FORCE.

INVECTA ET ILLA'TA, a phrase used in Scotch law to denote all things which a tenant has brought upon the premises, as his household furniture, tools, utensils, etc.; also, in case of thirlage, all corn brought within the limits of the thirl or servitude.

INVECTED, or **INVECKED**. See **ENGRAILED**.

INVENTION. See **PATENT**.

INVENTORY, a list or schedule of goods or property setting forth the particulars, so as to inform parties interested. The term is used in England in reference to an executor or administrator making out a list of the deceased person's effects. In Scotland it is also used in reference to the property of an infant, pupil, or minor, whose estate is under the care of a guardian, tutor, curator, judicial factor. In Scotland it is also used in connection with the various pleadings and deeds and documents produced or used in a suit or action, then called an inventory of process. So as to an inventory of titles, that is, the titles of an estate shown to a purchaser.

INVERARAY, a small royal and parliamentary burgh and seaport of Scotland, the county town of Argyleshire, is picturesquely situated on the w. shore of loch Fyne, where the river Aray falls into the loch, 45 m. n.w. of Glasgow. It consists of one principal street running parallel to the loch, and a square with a church in the center. An obelisk, standing near the church, commemorates the death of 17 gentlemen, all Campbells, who were executed here without trial in 1685, for their adherence to Presbyterianism. Close to the town stands Inveraray castle, the chief residence of the dukes of Argyle. Inveraray, the ancient town, the capital of the West Highlands, was situated at some distance to the n. of the present town. Not a vestige of it now remains. The trade of Inveraray is chiefly in herring-fishing. Pop. in 1871, 905.

INVERCARGILL, a t. in the province of Otago, New Zealand, formerly capital of Southland when a province, lies at the mouth of the New river. It possesses four banks and several churches. The surrounding district is principally taken up with pastoral operations. The town is a telegraph station, and two newspapers are published. It is a terminus of the Bluff Harbor and Invercargill railway; and several other lines are in course of construction or projected. Pop. '75, 2,480.

INVERNESS, a royal, parliamentary, and municipal burgh, situated at the mouth, and mostly on the right bank, of the river Ness. It is the chief town of the county to which it gives name, and may be regarded as the capital of the Highlands. Its environs, well cultivated and beautifully wooded, are almost surrounded by mountains and hills of various heights, forming altogether a most picturesque and interesting landscape. Pop. '71, 14,510; annual value of real property (1878-79), £68,161; corporation revenue (1877-78), £3,642. It unites with Fortrose, Nairn, and Forres in returning one member to parliament. The first charters of Inverness as a burgh are granted by king William the lion (1165-1214 A.D.). By one of these it is stipulated that when the king has made a ditch round the burgh, the burgesses shall make a palisade on the edge of the ditch, and keep it in good repair forever. In 1411 the town was burned by Donald, lord of the isles, on his way to Harlaw (q.v.). Macaulay, writing of the year 1689, describes Inverness as "a Saxon colony among the Celts, a hive of traders and artisans in the midst of a population of loungers and plunderers, a solitary outpost of civilization in a region of barbarians." The castle-hill, on the s. side of the town, part of an old sea-terrace, was the site of a castle, which, in 1303, was taken by the adherents of king Edward I. of England, but subsequently retaken by those of king Robert Bruce. King James I. is said to have held a parliament in the castle in 1427. An iron suspension-bridge, constructed in 1855, connects the two parts of the town. In the High street stands the town-cross, and beside it the famous Clach-na-cuddin, a lozenge-shaped blue slab, formerly regarded as the palladium of the burgh. In the same street are the town-hall and exchange, built in 1708. Of the old religious foundations of Inverness, there is little more than mere tradition. The Dominicans seem to have had a monastery, founded by king Alexander II., in 1233. The Franciscans also are believed to have had a convent in the town. Among more modern buildings and foundations may be enumerated Raining's school, established 1747; the spire of the old jail, 150 ft. high, built in 1791, curiously twisted by the earthquake of 1816, and since readjusted; the royal academy, 1792; the county buildings and jail, on the site of the castle, 1835; and St. Andrew's cathedral, a fine Gothic building, the foundation-stone of which was laid in Oct., 1866, by Dr. Longley, archbishop of Canterbury. There is a small woolen manufactory, a workmen's club and library, several printing establishments, three newspapers, a native bank (the Caledonian), and five other banking-offices. Inverness has still its four great annual fairs, but the establishment of shops throughout the county has greatly diminished their importance. It has three harbors, built at different times, and a considerable amount of shipping by the Moray firth and the Caledonian canal, which connects it with the w. coast.

INVERNESS, a co. of Cape Breton island, Nova Scotia, Canada; pop. '71, 23,415; soil fertile. Coal and petroleum are found. Fishing and agriculture are the chief occupations of the people. Capital, Port Hood.

INVERNESS-SHIRE, the largest co. of Scotland, includes Badenoch, Glenroy, and the valley of the Spey on the e.; Lochaber on the s.; Glenelg, Glen Garry, Arisaig, Moydart, and Fraser's county on the w.; Glen Urquhart and Glen Moriston towards the center. It includes also Strathglass on the n., and several of the Western islands, viz., Skye, Harris, north and south Uist, and Barra, etc. The mainland portion lies between n. lat. 56° 40' and 57° 36', and w. long. 3° 30' and 5° 55'; and is bounded on the e. by the coun-

ties of Aberdeen, Banff, Elgin, and Nairn; on the s. by Perth and Argyleshire; on the w. by the Atlantic and Ross-shire; and on the n. by Ross-shire. It measures from n.e. to s.w. 85 m., and from n.w. to s.e. 57 m.; and has an area of 4,256 sq.m., of which more than two-thirds consist of barren heath. The wildest and most mountainous portion is towards the w., comprising a tract 70 m. in extent, and designated the *Rough Bounds*. The most extensive moss in Great Britain lies on the s. of Badenoch, where, in the naturally formed wooded islands, large herds of deer find a refuge. These mosses had at one time been mostly, if not wholly, covered with trees, some of them of great magnitude. In Strathspey, three tiers of stocks, one above another, have been found, showing that a succession of forest trees must have grown up, flourished for ages, and then, one after another, disappeared by the work of time or the axe. At present, the natural pines occupy a larger space than in any other county of Britain. There are also many thousand acres of plantations of ordinary forest trees. Some mountains attain considerable altitude. Ben Nevis, now ascertained to be the highest in Great Britain, is 4,406 ft. above the level of the sea. Cairngorm, partly in this county, is 4,050 ft. high. The geological formation of the county is various; but primary rocks, consisting of gneiss, mica-slate, granite, porphyry, and trap rocks, mostly prevail. The most fertile soil of the county rests on the red sandstone in the valley of the Aird, and between the county town and Beauly. There are several lakes of some extent, as loch Ness, loch Lochy, loch Laggan, loch Erich, and a number of other lochs forming arms of the sea. The principal rivers are the Ness, Spey, Lochy, Beauly, Findhorn, Nairn, Garry, Morriston, and the Foyers (q.v.). The county is divided among 80 or 90 proprietors, a few of whom possess above 100,000 acres of surface. The old valued rent (1674) was £6,099; the valuation for 1878-79 was £319,877, exclusive of railways and canals, which amounted to £26,663. According to the agricultural returns of 1876, the total acreage under all kinds of crops, fallow, and grass, was 125,831: 40,221 acres were under corn crops, 22,421 under green crops, 26,895 under clover and grasses under rotation, 35,228 with permanent pasture (exclusive of heath and mountain-land). Of the land under crops, 738 acres were wheat, 7,169 barley, 31,067 oats, 1109 rye. Of land under green crops, 8,017 acres were potatoes, 14,234 turnips, 162 vetches, etc. Of live-stock, there were 9,008 horses, 54,742 cattle, 724,518 sheep, and 4,127 swine. There are comparatively few antiquities worth noting in the county. These consist principally of remains of vitrified forts and ruins of old castles. The battle which decided the fate of the Stuarts was fought April 16, 1746, on Culloden moor, a few miles from Inverness. The Gaelic language is still generally, but in scarcely any district exclusively, spoken. Pop. in 1871, 87,531. The constituency returns one member to parliament.

INVERSION, in music, is the transposing of one of the two notes of an interval by an octave upwards or downwards, to a position the reverse of that which it before occupied with respect to the other note, so that if the transposed note was the lower note of the two, it shall now be the higher one, and *vice versa*. The new interval thus formed takes its name from the complement of the octave; for example, a unison inverted becomes an octave, a second becomes a seventh, a third becomes a sixth, a fourth becomes a fifth, a fifth becomes a fourth, a sixth becomes a third, a seventh becomes a second, and an octave becomes a unison. The following shows how these arise:

Unison. 8v. 2d. 7th. 3d. 6th. 4th. 5th. 5th. 4th. 6th. 3d. 7th. 2d. 8v. Unison.

By inversion diminished intervals become augmented, and augmented become diminished; major become minor, and minor become major; but perfect intervals are also perfect when inverted. For inversion of chords, see CHORD. An important use is also made of the word inversion, in reference to a whole passage or phrase, for which see article COUNTERPOINT.

INVERTEBRATE ANIMALS, *Invertebrata*, are those animals which have not a vertebral column or spine. The division of animals into *vertebrate* and *invertebrate* is a natural and unavoidable one, acknowledged in all systems of zoology. But these groups being formed, the one on a positive and the other on a negative character, are by no means of equal value in the classification of the animal kingdom. In Cuvier's system, the invertebrate animals form three of the great divisions of the animal kingdom—viz., *mollusca*, *articulata*, and *radiata*, each of which, like *vertebrata*, exhibits a peculiar type of structure. There are also animals of lower organization than those which can with certainty be referred to these divisions, although included by Cuvier amongst the *radiata*, forming the *acritu* and *protozoa* of recent systems. Amongst the lower invertebrate animals, much more than amongst vertebrate animals, the arrangement into groups must be regarded as at present, in a great measure, tentative and provisional; although in the higher departments of invertebrate zoology many of the classes and other groups are very well defined. The organization of some of them, as insects, however different from that of vertebrate animals, is not evidently lower, but exhibits a perfection as admirable as in any of them, whilst all vital powers are most fully displayed.

INVERTEBRATE ANIMALS (ant.). The following synopsis is a general classification, according to the latest and best authorities, of the principal divisions of the invertebrate branch of the animal kingdom, including classes, orders, and most of the families. It will serve, also, as a reference or index to the various articles scattered throughout the work, which specially treat of genera and species. The etymology of the principal names is usually given except when found in the articles referred to.

SUB-KINGDOM I. PROTOZOA, first or lowest animals; very simple, mostly microscopic; body composed of a jelly-like, albuminous substance, having no nervous, and no distinct circulatory, system; usually no mouth and no special digestive cavity. See **PROTOZOA.**

CLASS A. GREGARINIDA (Lat. *gregarius*, living together in numbers). Very minute organisms inhabiting the interior of insects and other animals. They have no power to throw out prolongations as in rhizopoda. This class has only one order. See **GREGARINES.**

CLASS B. RHIZOPODA (q.v.). Protozoa having the power of throwing out and retracting prolongations (pseudopodia) of the body substance; no mouth, with few exceptions. Divided into five orders:

Order I. Monera (Gr. *monas*, unit). Minute organisms having the power of throwing out thread-like prolongations, which are a part of the structureless body (*sarcōde*). These pseudopodia branch out in all directions, interlacing and anastomosing. When at rest the body is more or less globular. There is no nucleus or contractile vesicle.

Order II. Amœba (Gr. *amoibos*, changing). Rhizopods which are usually naked, having short, blunt pseudopodia which do not anastomose. They contain a nucleus and one or more contractile vesicles. The amœba or proteus animaleule is the type of the order. It is a microscopic animal, which makes its appearance in vegetable fresh-water infusions. It is composed of two layers of gelatinous matter, called the entosarc and the endosarc, or outer and inner layers. The endosarc contains the nucleus and contractile vesicle or vesicles, and also cavities called vacuoles. There are no traces of any nervous system in the amœba, and yet it possesses locomotive power.

Order III. Foraminifera (Lat. *foramen*, an aperture). Rhizopods in which the body is protected by a shell or *test*, usually composed of carbonate of lime. Body not divided into entosarc and endosarc, as in amoeba; and there is neither nucleus nor contractile vesicle. Pseudopodia long, thread-like, and interlacing. The foraminifera are mostly marine. Dr. Carpenter says that foraminiferous fauna probably have a greater modern range of seas than at any previous period, but there is no indication of any tendency to elevation to a higher type. There are vast deposits of them in the deeper portions of the Atlantic ocean, where the water is warmed by heated currents. There are several genera and species, many of them presenting rarely beautiful forms. Foraminifera have been found in paleozoic and mesozoic formations, and the *cozoön Canadense*, found in the Laurentian rocks of Canada, has been thought to be a gigantic foraminifer. See **FORAMINIFERA.**

Order IV. Radiolaria (Lat. *radius*). Rhizopods having a siliceous shell or test, or siliceous spicules, and pseudopodia standing out like radiating filaments, sometimes interlacing. There are three families.

Family 1. Acanthrometrina, minute globular bodies, surrounded by siliceous, radiating spines, often floating near the surface of the ocean, sometimes in great numbers.

Family 2. Polycistina. Nearly related to foraminifera, the principal difference being that the shells are flinty instead of calcareous. The siliceous shell is sometimes exceedingly beautiful. They are all microscopic, and have a wide distribution in the ocean. They are also abundant tertiary fossils.

Family 3. Thalassicollida (Gr. *thalassa*, sea, and *kolla*, glue). Rhizopods having "structureless cysts containing cellular elements and sarcōde, and surrounded by a layer of sarcōde, giving off pseudopodia, which commonly stand out like rays, but sometimes have the form of a network" (Huxley). They are simple, or composite. The three best known genera of the family are *sphaerozoun*, *collosphaera*, and *thalassicolla*. They abound in most seas, floating near the surface; size, from an inch in diameter downwards.

Order V. Spongida or Porifera (q.v.). "Sarcōde bodies destitute of a mouth, and united into a composite mass which is traversed by canals opening on the surface, and is almost always supported by a frame-work of horny fibers, or of siliceous or calcareous spicula" (Allman). See **SPONGE.**

CLASS C. INFUSORIA (Lat. *infusum*, an infusion). Protozoa usually provided with a mouth and rudimentary stomach. They have vibrating cilia or contractile filaments, but no pseudopodia; bodies microscopic, usually consisting of three layers; occur in infusions. Divided into three orders:

Order I. Ciliata (Lat. *cilium*, an eyelash). Infusoria in which the outer layer of the body has more or less vibratile cilia, or hair-like organs, for locomotion or procuring food. Some are provided also with jointed bristles; others have hooks for attaching themselves to other bodies. The typical members of the order are *paramaecium* and *vorticella* (q.v.). See **INFUSORIA.**

Order II. Suctoria. Infusoria in which the body is covered with a number of radi-

ating, retractile, filamentous tubes, having at their extremities suectorial disks, by means of which they obtain food.

Order III. Flagellata. Infusoria having lash-like filaments (flagella) and occasionally cilia. Some have one and some two flagella, and some are composed of numerous zooids, each with a single flagellum and projecting membranous collar, all contained in a slimy sarcodite, and forming a cylindrical colony.

SUB-KINGDOM II. COELENTERATA (q.v.). This sub-kingdom is the modern representative of the Radiata of Cuvier, with the following exceptions: The echinodermata and solecida have been removed to form annulioidea; all of protozoa, to form that sub-kingdom; and polyzoa have been placed with mollusca. The remainder of radiata constitute coelenterata, a name proposed by Frey and Leuckart, from Gr. *koilos*, hollow, and *enteron*, the bowel. The principal feature of this sub-kingdom is the peculiar structure of the digestive apparatus; the body cavity and the stomach being one and the same. In some of the coelenterata, however, there is a wide membranous tube leading from the mouth into the general interior cavity. This sub-kingdom is divided into two classes, hydrozoa and actinozoa. See POLYPI.

CLASS A. HYDROZOA (Gr. *hudra* and *zoön*, animal; hydra animal). Coelenterata in which the walls of the digestive cavity entirely coincide with those of the body cavity. The reproductive organs are external processes of the body. They are all aquatic, mostly marine. The hydrozoa are divided into six sub-classes:

SUB-CLASS I. HYDROIDA. See HYDROIDS. This sub-class comprises six orders:

Order I. Hydrida. Fresh-water polyp; only one genus, *hydra*, including various species.

Order II. Corynida (Gr. *korune*, a club). Pipe coralline (q.v.), (tubularia). The order is entirely marine, with one exception. The reproductive elements are developed in distinct buds or sacs, which are external processes of the body, called by professor Allman, *gonospheres*. There are great variations in the form of these generative buds. In some species they are mere sac-protuberances called sporosacs. There is an advance in structure in the different genera, the gonophore being sometimes composed of a bell-shaped disk, called the gonocalyx.

Order III. Sertularida (Lat. *sertum*, a wreath). The animals of this order resemble the corynida in becoming permanently fixed after their embryonic condition. Each polypite consists of a soft, contractile and extensible body, having at its distal extremity a mouth surrounded by prehensile tentacles. The internal arrangement of the whole organism is exceedingly interesting. See SERTULARIA, PLUMULARIA, and POLYPI.

Order IV. Campanularida (Lat. *campanula*, a bell). This order resembles sertularida, but the gonospheres are usually detached as free-swimming medusae, instead of being permanently attached.

Order V. Thecomedusae. Prof. Allman has recently described a remarkable hydrozoön which he regards as the type of a new order. It is always found embedded in a species of sponge, which it permeates by chitinous (see CHITIN) tubes, opening on the surface. See STEPHANOSCYPHUS MIRABILIS.

Order VI. Medusidae or *Hydromedusidae* (acalephæ in part). The animals included in this order have often been placed in a distinct sub-class (discophora) of hydrozoa, but they are now generally regarded as simply an order of hydroid zoophytes. They comprise most of the smaller organisms commonly known as jelly-fishes or sea-nettles, from the property of causing a stinging to any part of the human body which may be touched by them. See ACALEPHÆ.

SUB-CLASS II. SIPHONOPHORA (Gr. *siphon* and *phero*, I carry). All of this sub-class are permanently free, and composite. They are very beautiful, delicate organisms, chiefly inhabiting the surface of tropical seas. There are two orders:

Order I. Calycophoridæ (Gr. *kalyx*, a cup, and *phero*, I carry). The bodies of the polypites in this order are distinctly divided into three portions, called proximal, median, and distal. The proximal ends are provided with protecting plates called bracts. The calycophoridæ have swimming bells by which they propel themselves through the water. Huxley divides this order into four families: diphydæ, sphæronectidæ, prayidæ, and hippopodidæ.

Order II. Physophoridæ (Gr. *physa*, an air-bladder). The polypites of this order resemble those of the preceding in form, but the tentacles are more complicated, and are sometimes several inches in length. They also have peculiar bodies, called feelers, or pulpi, which resemble immature polypites. The reproductive organs are developed upon special processes, called gonoblastidia, which sometimes remain permanently attached, or are thrown off as free-swimming medusoids. The genus physalia is the Portuguese man-of-war. See PHYSALIA. The order is divided into several families by Huxley.

SUB-CLASS III. LUCERNARIDA (Lat. *lucerna*, a lamp). These are the sea-blubbers, sea-jellies, hidden-eyed medusæ. Divided into three orders:

Order I. Lucernaridae. This order comprises those lucernarida which have only a single polypite, and are fixed, but only for a time. Reproductive elements developed in the walls of the umbrella, without the intervention of free zooids.

Order II. Pelagidæ (Gr. *pelagos*, sea). These animals, like the preceding, have only

a single polypite, but have an umbrella with marginal tentacles in which are developed the reproductive elements.

Order III. Rhizostomidae (root-mouthed lucernaridae). In this order the reproductive elements are developed in free zooids, produced by fission from attached lucernaroids. The umbrella of generative zooids is without marginal tentacles, and the polypites are numerous, forming with the genetalia a dendriform mass depending from the umbrella (Greene). See *RHIZOSTOMIDÆ* and *ACALEPHIÆ*.

SUB-CLASS IV. GRAPтолITIDÆ (Gr. *grapho*, I write). Rhabdophora of Allman. The members of this sub-class are all extinct, but their nearest living allies are the serularians. Their structure is not easily made out. They are generally found in pyritous impressions, having a silvery luster, in the Silurian formations, and are characteristic fossils. See *GRAPтолITES* and *SERTULARIA*.

SUB-CLASS V. HYDROCORALLINÆ. This sub-class has been formed by Mr. Moseley for the reception of two groups of marine animals which produce a regular skeleton of carbonate of lime, often of large size, and which have been hitherto generally referred to the corals. See *MILLEPORE* and *STYLASTERIDÆ*.

CLASS B. ACTINOZOA (Gr. *actin*, a ray). Cœlenterata, in which the imperfect stomach, or wide tube, which is so called, empties into the body cavity, which latter is divided into a number of compartments by vertical partitions. The reproductive organs are internal. As in hydrozoa, the tissues are chiefly divided into two layers, an ectoderm and an endoderm, but there is more tendency to the formation of special organs, and in some of the members of the class muscular fibers are well developed. No vascular system has been found in any of the actinozoa, nor any traces of a nervous system except in ctenophora. Most of the actinozoa are permanently fixed. Sea-anemones have some locomotive power, and one order, ctenophora, above mentioned, consists of active, free-swimming organisms. Many of the class secrete a horny or calcareous skeleton called a *coral*, or *corallum*. The actinozoa are divided into four orders:

Order I. Zoantharia (Gr. *zoön*, animal, and *anthos*, a flower). In this order the soft parts are disposed in multiples of five or six, typically six, and they also have simple tentacles, usually numerous. The zoantharia are divided into three sub-orders:

Sub-order I. Zoantharia malacodermata. In these organisms there is either no corallum or a pseudocorallum in the form of adventitious spicules scattered through the soft parts. This sub-order comprises three families:

Family 1. Actiniæ. These are commonly known as sea-anemones. They have no corallum or only a pseudocorallum, and are seldom compound. They have locomotive power.

Family 2. Ilyanthidæ. No corallum; polyps single and free, with rounded tapering base. The genus *ilyanthus* is in most respects identical with the ordinary *actiniæ*, but the base of its conical body is much attenuated, and by separating allows of a free existence.

Family 3. Zoanthidæ. These organisms are in colonies, and exist in the form of a crust or of creeping roots, and have no power of locomotion.

Sub-order II. Zoantharia sclerobasica. These are the black corals, and are always composite, composed of a number of polypes united by a common, fleshy material, which is thin and internally supported by a simple or branched horny axis called a *sclerobase*. The polypes do not secrete a calcareous, but a horny corallum, and they generally have six simple tentacles. All the black corals form colonies, which are fixed to some foreign object.

Sub-order III. Zoantharia, Sclerodermata, or Madreporidæ. The animals comprising this sub-order include most of the coral-producing zoophytes of recent seas. See *ZOANTHARIA*.

Order II. Alyconaria. The asteroid polyps. Tentacles fringed; soft parts arranged in multiples of four instead of five or six, as in zoantharia. All the members of this order are composite, the whole colony forming a branched mass, with the exception of one genus, *haimeia*. Divided into five families: 1. alyconidæ; 2. tubiporidæ; 3. pennatulidæ; 4. gorgonidæ; and 5. heliophoridæ; the fifth family being recently founded by Mr. Moseley. The alcyonium, or "dead-men's toes," may be regarded as the type of the family alyconidæ. The tubiporidæ contain the organ-pipe corals, the corallum being composed of bright scarlet cylinders united by plates. See *CORAL*, *POLYPI*, *GORGONIA*, *ALCYONIUM*, and *PENNATULA*.

Order III. Rugosa (Lat. *rugosus*, wrinkled). This order is extinct, and, excepting *holocystis elegans* of the cretaceous formation, their fossils do not occur in rocks later than the paleozoic, and therefore are known only by the characteristics of the corallum. The rugosa are divided into four families: 1. stauridæ; 2. cyathaxonidæ; 3. cyathophyllidæ; 4. cystiphyllidæ.

Order IV. Ctenophora (Gr. *kteis*, a comb, and *phero*, I carry). "Transparent, oceanic, gelatinous actinozoa, swimming by means of *ctenophores*, or parallel rows of cilia disposed in comb-like plates" (Greene). The order comprises five families: 1. calymmidæ; 2. cestidæ; 3. callianiridæ; 4. pleurobrachiadæ; 5. beroidæ. See *BERÖE*. The cestidæ have a flat, ribbon-shaped body at right angles to the direction of the digestive tract, and three or four feet long (*Venus's girdle*). The pleurobrachiadæ, the typical family, have a transparent, colorless, spherical, melon-shaped body, in which the two

poles of the spheroid are called *oral* and *apical*, the rest of the body constituting the interpolar region. There is a transverse mouth at the oral pole opening into a fusiform digestive cavity, in the lower part of which there are peculiar brown cells performing, it is supposed, the functions of a liver. The interpolar region, or body, is traversed by eight meridional bands or *ctenophores*, elevated transversely into a number of ridges, each having a fringe of cilia, forming a comb-like plate. Besides these comb-like ridges, there are two long, tentacular processes, also fringed with curved cilia, forming singularly beautiful and interesting organs. See *CTENOPHORE*.

Sub-kingdom III. Echinodermata (Gr. *echinos*, hedgehog, and *derma*, skin; from having a spiny skin). The echinodermata, including the sea-urchins, star-fishes, etc., were formerly included in the sub-kingdom *radiata*, but they form a very distinct group, and although they have been classified by prof. Huxley, on account of some remarkable affinities with the lower worms, as the tape-worm and other intestinal parasites, in a sub-kingdom called *annuloida*, the weight of authority inclines to a separation into a distinct group, constituting a sub-kingdom. The echinodermata may be defined as follows: Simple marine organisms, the body of the adult more or less conspicuously radiate, that of the young often distinctly bilateral. Nervous system radiate, composed of an æsophageal ring and radiating branches. Sexes generally distinct, rarely united. They are commonly known as sea-urchins, star-fishes, brittle stars, feather-stars, sea-lilies, sea-cucumbers, etc. The echinodermata are divided into seven orders:

Order I. Crinoidea (Gr. *krinon*, a lily, and *eidos*, form). Sea-lilies; feather-star (q.v.); medusa-head crinoid; pentacrinus (q.v.); stone-lily—*erinerinus liliiformis*. See *ENCRINITES* and *CRINOIDEA*.

Order II. Blastoidea (Gr. *blastos*, a bud, and *eidos*, form). These animals are all extinct, and their fossils are found in the paleozoic formations, chiefly in the carboniferous rocks. The body was fixed to the sea-bottom by a short, jointed pedicel, and in many respects resembled the following.

Order III. Cystoidea (Gr. *kystis*, a bladder). These organisms are also extinct, and their fossils are confined to the paleozoic age. The body was, in most instances, fixed to the sea-bottom by a short, jointed, calcareous pedicel, and was more or less spherical and covered with numerous polygonal, calcareous plates accurately fitted together. On the upper surface there were two, and sometimes three, apertures, the use of which is a matter of controversy. One was, probably, for the mouth, one for locomotion, and the third for voiding excreta.

Order IV. Ophiuroidea (Gr. *ophis*, a snake; *oura*, a tail; and *eidos*, form). Sand stars—*ophiuria*; brittle stars—*ophiocoma*.

Order V. Asteroidea (star-formed) Star-fishes (q.v.); cross-fish—*uraster*; sun-star—*solaraster*; cushion-star—*goniaster*.

Order VI. Echinoidea, sea-urchins, sea-eggs, heart-urchins. Sexes distinct. See *ECHINUS*.

Order VII. Holothuroidea, vermiform or slug-like echinoderms, with a leathery skin, in which calcareous granules and spicules are developed; mouth surrounded by a circlet of tentacles; larva vermiform, and without a skeleton; sexes usually distinct. The members of this order are commonly known as trepangs, sea-cucumbers, etc., and are the most highly organized of all the echinodermata. There is a long, convoluted intestine, and a special respiratory or water-vascular system is often developed in the form of arborescent tubes. At a certain period the young are barrel-shaped, having transverse rings of cilia, by means of which they rotate rapidly on their long axis, and have been at this stage of existence described as a distinct genus, under the name of *auricularia*. In the adult typical holothurians, locomotion is produced by means of rows of ambulacral tube-feet, or by alternate extension and contraction of the body, but in some members the animal moves by means of spicula distributed in the integument. See *HOLOTHURIA*.

The echinodermata began their existence in the lower Silurian formation, and their remains are found in most sedimentary rocks up to the present time. The cystoidea and blastoidea are extinct, and not more recent than paleozoic. Many crinoids are extinct, having their greatest development in paleozoic time. In the triassic formation is found the beautiful stone-lily. In the Jurassic occurs the pear-eracrinit, and in the chalk the tortoise-eracrinit. Fossils of asteroidea abound in both upper and lower Silurian rocks, as paleogaster, a beautiful form (q.v.). Many rare and beautiful fossils abound in the oolite, as goniaster, plumaster, and uraster. The ophiuroidea are rare fossils, the protaster Sedgwickii being an example, found in the silurian; but most of the members are more recent, many reaching to the present time. The echinoidea are represented in the paleozoic rocks by only one family, but numerous fossils are found in mesozoic and recent periods. The echinoids of the secondary and tertiary formations resemble present forms in not having more than twenty rows of calcareous plates.

SUB-KINGDOM IV. ANNULOSA (Lat. *annulus*, a ring). The members of this sub-kingdom have a body which is usually more or less elongated, and always bilaterally symmetrical instead of radiate. Usually the body is divided into segments, which may be definite or indefinite, arranged along an antero-posterior axis. Lateral appendages, when present, are symmetrically arranged. The nervous system consists of one or two

ganglia situated anteriorly, or of a double gangliated chain near the ventral surface. This kingdom is divided into three primary sections.

SECTION I. SCOLECIDA (Gr. *scolex*, a worm), including parasitic worms, wheel-animalcules, etc., whose characteristics are an elongated, flattened body, which may have an annulated integument, but otherwise not at all or imperfectly segmented. There is a water-vascular system, but none for the circulation of an elaborated fluid. The nervous system consists of a few ganglionic masses, or a ring, from which proceed a few filaments, the principal feature which separates them from the ringed worms, or annelida, which have a ventral gangliated nerve chain. The section comprises two divisions, containing seven orders:

DIVISION I. PLATYELMIA (Gr. *platus*, flat). The members of this division have a more or less flattened body, and no true segmentation. It includes two parasitic orders and one non-parasitic order.

Order I. Tænaida or *Cestoidea*. See ENTOZOA, HYDATID, and TAPE-WORM. The joints of the tape-worm are generative segments, which are thrown off by a process of gemmation, and are not true segments of the animal, which consists of the head.

Order II. Trematoda (Gr. *trema*, a hole). These organisms are known as suctorial worms. See FLUKE, HEMATOZOA, MONOSTOMA, and TREMATODA.

Order III. Turbellaria (including *planaria* of Cuvier). See PLANARIA and NEMERTES. These animals are nearly all aquatic and non-parasitic.

DIVISION II. NEMATELMIA (q.v.). Scolecida, having an elongated and cylindrical body. Most of the division have an annulated integument, but there is no true segmentation, and rarely locomotive appendages. They are mostly unisexual, and are parasitic during the whole or a part of their existence. The division comprises three orders:

Order I. Acanthocephala, thorn-headed worms (Gr. *akantha*, thorn; *kephale*, head). These animals are entirely parasitic, vermiform, and have no mouth or alimentary canal. They have a proboscis armed with curved hooks. At the base of the proboscis there is a single ganglion of nerve matter giving off radiating filaments in all directions. It has been discovered that, as in the tænaida, the adult worm is developed within a hooked embryo. These *thorn-headed worms* are among the most formidable that infest the intestinal canal of vertebrates, particularly of birds and fishes.

Order II. Gordiacea, hair-worms. See NEMATELMIA. These are thread-like, parasitic organisms, which in their earlier stages inhabit the bodies of insects, such as beetles and grasshoppers. They have a mouth and alimentary canal. The sexes are distinct, and they quit their hosts in order to breed. They resemble hairs, and are often many times as long as the insects they infest. See WORMS.

Order III. Nematoda or *Nematoidea* (q.v.). Most of these animals are internal parasites, inhabiting the intestinal canal, pulmonary tubes, or cellular tissues of man and other animals; but many are not parasitic. The best known are the *ascaris lumbricoides*, the round worm of the stomach and intestines (see ASCARIS); the *oxyuris vermicularis*, or thread-worm (q.v.); *filaria medinensis*, or Guinea-worm (q.v.); *trichina spiralis* (q.v.), vinegar eel. See SCLEROSTOMA and HEMATOZOA.

DIVISION III. ROTIFERA. Order *rotifera* (wheel animalcule, builder animalcule, flexible creeper). See ROTATORIA. The position of this group is doubtful. It is placed here by Huxley, but it is sometimes placed among the lower orders of annulosa. These animals have a body composed of numerous segments or somites (Gr. *soma*, body), arranged along a longitudinal axis. They have a nervous system consisting of a double chain of ganglia running along the under surface of the body, with a collar of nervous matter around the gullet. The sub-kingdom is divided into two primary divisions: *arthropoda*, provided with articulated appendages; and *anarthropoda*, having no articulated appendages.

SECTION II. ANARTHROPODA. Locomotive appendages, when present, not distinctly articulated to the body (whence the name). This division contains the earth-worms, leeches, tube-worms, spoon-worms, etc. Divided into three classes:

CLASS I. GEPHYRA (*sipunculoidea*). Body sometimes annulated, sometimes not; no ambulacral tubes or foot-tubercles; sometimes bristles serving for locomotion. The sipunculus and its allies form this class. From certain affinities they have sometimes been placed among the echinodermata, but they do not secrete calcareous matter, and there is no radiate arrangement of the nervous system (see SIPUNCULUS). The British species of this class are grouped by prof. E. Forbes as follows:

Family 1. Sipunculacea, having a retractile proboscis, around the extremity of which there is a circlet of tentacles.

Family 2. Priapulacea, having a retractile proboscis, but no tentacles.

Family 3. Thalassamacea, proboscis with a long, fleshy appendage; no oral tentacles.

CLASS II. ANNELIDA. Included by Linnaeus in his class *vermes*. See ANELIDA. The members of this class have distinct segments, each segment usually corresponding with a single pair of ganglia in the double ventral cord, all the segments being similar except those at the anterior and posterior extremities. Each segment may have a pair of lateral appendages, but they are never articulated with the body. There are four orders:

Order I. Hirudinea (discophora, or suctorial leeches). These animals are characterized by having a locomotive and adhesive sucker posteriorly, or at both extremities, and by

having no bristles or foot-tubercles. They are hermaphrodite, and the young undergo no metamorphosis. See LEECH.

Order II. Oligochaeta (Gr. *oligos*, few; *chaite*, hair), earth-worms—*lumbricidae*; water-worms—*naididae*; and mud-worms—*limicola*. These have locomotive appendages in the form of bristles. See EARTH-WORM.

Order III. Tubicola (Lat. *tuba*, a tube). These annelides inhabit tubes, sometimes calcareous and secreted by the animals; sometimes composed of a glutinous secretion mixed with grains of sand, forming a cement. Sexes separate; young passing through a metamorphosis. There is a pseudo-hemal system, usually containing red blood, sometimes green. Respiratory organs in spiral, funnel-shaped tufts, or branchiae. See TUBICOLÆ and SERPULA.

Order IV. Errantia (Lat. *erro*, I wander), *nereidea*, *dorsibranchiata*. Respiratory organs in the form of branchial tufts, arranged along the back and sides of the body. This order includes the sand-worms, sea-worms, and sea-mice. Body soft, integument having a great number of segments; head provided with eyes, and two or more feelers, which are not jointed like the antennæ of crustaceans; mouth on the under surface of the head, and having one or more pairs of horny, lateral-working jaws; stomach and intestine usually distinct, and lined with ciliated epithelium; perivisceral cavity filled with a colorless fluid containing corpuscles (Owen). The pseudo-hemal system consists of a dorsal and a ventral vessel connected by transverse branches. There are pulsating dilations at the base of the branchial tufts. The circulating fluid is usually red, but is yellow in some, as the sea-mouse (q.v.). On account of the position of the tufts the members of this order are sometimes called *dorsibrachiate*, or *notobrachiate*. The nervous system in errantia consists of a double, ventral cord, with two ganglia to each segment or somite. The cerebral ganglia, situated in front of the gullet, are large, and send filaments to the eyes and feelers. Among the errantia is the common lob-worm, often used by fishermen for bait. It lives in deep burrows formed in the sand on the sea-shore, the animal passing the sand through its body to get nourishment. There are thirteen pairs of branchiae or gills, placed one of each pair on a side, in the middle portion of the body. In the nereidæ, or sea-centipedes, the head is distinct, and has eyes and feelers, the mouth having a large proboscis with horny jaws. In the eunicea the branchiae are large, and the mouth has from seven to nine horny jaws. The eunice gigantea often has over 400 segments, and is sometimes more than 4 ft. long. Traces of errantia are found in the Cambrian rocks and other formations up to the present time, and the tubicola have left thin sheaths in all formations from the Silurian upwards. See LUG-WORM, LOB-WORM, NEREIS, and PALOLO.

CLASS III. CHÆTOGNATHA (Gr. *chaite*, bristle; *gnathos*, jaw) (Huxley). arrow-worms (*sagitta*). This class is constituted to receive the single genus *sagitta*, formerly classed among the annelides. See SAGITTÆ.

SECTION III. ARTHROPODA, OR ARTICULATA (q.v.). The members of this division of the sub-kingdom annulosa possess jointed appendages, articulated to the segments of the body (whence the name). The following are the chief characteristics: The body is composed of a series of segments arranged along a longitudinal axis, more or less of the segments having articulated appendages, and both being protected by a horny, shell-like cuticle. The appendages are hollow, containing muscles. The nervous system is in the form of a double chain of ganglia, running along the ventral surface of the body, and united by commissures. The blood-circulatory system is placed near the back, and consists of a contractile cavity provided with valvular apertures. There is communication with a perivisceral cavity, and the system contains true corpusculated blood. Respiration is effected by the general surface of the body, by gills, by pulmonary sacs, or by tubular folds of the integument called *tracheæ*. The arthropoda are divided into four great classes, viz.: the *crustacea*, including the lobsters, crabs, etc.; the *arachnida*, including the spiders, scorpions, etc.; the *myriapoda* (centipedes and millipedes); and the *insecta*, or insects.

CLASS I. CRUSTACEA (Lat. *crusta*, a crust). Respiration effected by gills or by the general body surface. There are two pairs of antennæ. The locomotive appendages are more than eight, articulated to the segments of the thorax, and in most instances to those of the abdomen, the pairs generally being from five to seven. All these animals pass through a series of metamorphoses, and every embryonic organ or part is permanently represented in some member of a lower order. Authorities differ in the classification of the crustacea, but that adopted here divides them into four sub-classes, comprising sixteen orders.

SUB-CLASS I. EPIZOA (Gr. *epi*, upon, and *zoön*, animal). These animals are parasites in the adult state upon the bodies of fishes, but when young they are free-swimming, and have antennæ and eyes. This sub-class contains three orders:

Order I. Ichthyophthiria (Gr. *ichthus*, a fish, and *phtheîr*, a louse). These animals become attached to the skin, eyes, or gills of fishes by a suctorial mouth, or cephalic processes, or by a disk borne by the last pair of thoracic limbs, or by hooklets at the extremities of the first pair. The males are usually not attached, but adhere to the females, which are much larger. In attaining the adult condition they pass through retrograde metamorphosis. See LERNEADA.

Order II. Rhizopcephala (Gr. *rīza*, root, and *kephale*, head; root-headed). These

animals, like those of the preceding order, are free-swimming when young. The larvæ have ovate bodies, one eye, and a dorsal shield. In the second, or pupæ stage, they become inclosed in a bivalve shell and attach themselves to larger crustaceans. They then lose all their limbs, and appear like mere sacks. At the point of attachment they send tubular roots into the body of the host, winding round its intestines.

Order III. Cirripedia. Larvæ free-swimming, but a cement-like secretion from a gland is discharged through the antennæ by which they become permanently attached to rocks, wood, cetaceans, turtles, other crustaceans, and sometimes jelly-fishes. The more important members are the *acorn-shells* and the *barnacles*. See *BALANUS*, *BARNACLES*, and *CIRRHOPODA*. The cirripedia are divided into three sub-orders, *thoracica*, *abdominalia*, and *apoda*.

SUB-CLASS II. ENTOMOSTRACA (q.v.), divided into two great *legions* or divisions.

DIVISION A. LOPHYROPEDA (Gr. *lophouras*, having stiff hairs). Possessing few branchia, and attached to the appendages of the mouth. Feet few, mainly locomotive. Mouth not suetorial, but has organs of mastication. There are two orders.

Order I. Ostracoda (Gr. *ostrakon*, a shell; *eidos*, form), water-fleas. Small animals inclosed in a shell composed of two valves united along the back by a membrane. The respiratory organs are attached to the posterior jaws, and there are only two or three pairs of feet. Most of them pass through several stages of metamorphosis. See *CYPRIS*.

Order II. Copepoda (Gr. *kope*, an oar, and *podes*, feet). These animals inhabit both salt and fresh water. Head and thorax covered by a shell, and furnished with five pairs of swimming feet, and generally two caudal locomotive appendages. One of the most common of the water-fleas is a member of this order, under the name of *cyclops* (q.v.). These oar-footed crustaceans are regarded by some zoologists as being the same in the larval state as *ichthyophira*, the latter animal becoming modified by being attached to, and existing upon, other animals.

DIVISION B. BRANCHIOPEDA (q.v.). These animals have many branchiæ attached to the legs, which are numerous and formed for swimming. This division is made to include *cladocera*, *phyllopoda*, and *trilobita*, although the latter departs somewhat from the characteristics of the other members.

Order I. Cladocera (Gr. *klados*, a branch, and *keras*, a horn). Carapace or shell similar to ostracoda; feet, four to six pairs, usually bearing respiratory organs; two pairs of antennæ, one pair large, branched, and used for swimming. The *daphnia pulex*, or branched-horned water-flea, is inclosed within a bivalve shell which opens anteriorly. The head is not inclosed, and has a single eye. The gills are in the form of plates, attached to five pairs of thoracic legs. The animal is parthenogenetic (see PARTHENOGENESIS), and it produces two kinds of eggs. One kind, the summer eggs, are deposited between the valves of the carapace, and are hatched there; but the winter eggs are deposited in a receptacle on the back of the carapace, called the saddle, which after a time is cast off and floats about till the water becomes warm enough to hatch the eggs. See WATER-FLEA.

Order II. Phyllopoda (Gr. *phyllon*, a leaf), leaf-footed crustaceans. Carapace covering head and thorax, or the body entirely naked. Feet never less than eight pairs, leaf-formed and respiratory, and also used in swimming. They are interesting on account of their affinity to the extinct order of trilobites. The various species of the genus *branchipus* have no carapace, and exist in ponds and swamps in many parts of the world. The brine-shrimps (genus *artemia*) are found in the brine pans of salt-works, and in lakes much salter than the ocean. They abound in the Great Salt lake of Utah. See BRINE-SHRIMP.

Order III. Trilobita (three-lobed crustaceans). See TRILOBITES.

Order IV. Merostomata (Gr. *meron*, thigh, and *stoma*, mouth). Crustaceans, often of great size, in which the mouth is furnished with mandibles and maxillæ, whose terminations become walking or swimming feet and organs of prehension. Divided into two sub-orders, *xiphosura* and *eurypterida*.

Sub-order 1. *Xiphosura* (Gr. *xiphos*, a sword; *oura*, a tail). The only living representatives are the king-crabs (horse-shoe crabs), of which there are but few species. See KING-CRAB and MEROSTOMATA.

Sub-order 2. *Eurypterida* (Gr. *euros*, broad, and *pteron*, wing), extinct crustaceans, some of which reached gigantic dimensions. See MEROSTOMATA.

SUB-CLASS IV. MALACOSTRACA (Gr. *malakos*, soft, and *ostrakon*, shell). The name was used by Aristotle to designate the whole class *crustacea*). Crustaceans having generally a definite number of somites, seven belonging to the thorax, and seven to the abdomen, counting the telson, or last segment, or tail. There are two primary divisions.

DIVISION A. EDRIOPHTHALMATA (q.v.). Malacostraca in which the eyes are sessile (whence the name), and the body not protected by a carapace; eyes usually compound, but sometimes simple; as a rule, there are seven pairs of feet, for which reason Agassiz called the division *tetradecapoda*. There are three orders.

Order I. Lamidipoda (Gr. *laimos*, throat; *dis*, twice; *podes*, feet). First thoracic segment amalgamated with the head, the appendages of the segment appearing to be inserted into the throat (whence the name). Respiratory organs consist of vesicles,

attached to the thorax or bases of the legs; feet hooked; all marine. See WHALE-LOUSE.

Order II. Amphipoda (Gr. *amphi*, both; *podes*, feet). Resembles the preceding, but the first thoracic segment is not united to the head; seven pairs of thoracic limbs, some of them directed forwards and some of them backwards, from which fact the order derives its name. They are all small animals. See GAMMARUS and SAND-HOPPER.

Order III. Isopoda (q.v.). Respiratory organs in the form of branchiæ attached to the under surface of the abdomen. The young are developed within a larval membrane, which in time bursts, liberating them, but they then have only six instead of seven pairs of limbs, as in the adult state. The isopoda are divided by Milne-Edwards into three sections, which from their habits are called natatorial, sedentary, and cursorial. Some of the natatorial are parasites of fishes. All the sedentary are parasites of the gill-chambers or ventral surfaces of decapod crustacea. The cursorial, or running, are principally land animals, the better known being the wood-louse (q.v.). An aquatic genus is limnoria (q.v.). Other well-known isopods are the water-slaters, rock-slaters, shield-slaters, etc. See ASELLUS and WOOD-LOUSE.

DIVISION B. PODOPHTHALMATA. See PODOPHTHALMA. This division contains the shrimps, lobsters, and crabs, and is divided into two orders.

Order I. Stomopoda (q.v.). See SQUILLA, GLASS CRAB.

Order II. Decapoda (Gr. *deka*, ten; *podes*, feet). Branchiæ or respiratory organs contained in cavities at the sides of the thorax. Heart in the form of a quadrate sac, having three pairs of valvular openings. There are great differences in the mode of development. The decapoda are divided into three tribes, the macrura, anomura, and brachyura. See CRAB, CRUSTACEANS, HERMIT CRAB, PEA CRAB, PRAWN, PURSE CRAB, RIVER CRAB, and LAND CRAB.

CLASS II. ARACHNIDA (q.v.). This class resembles the crustacea in many essential characteristics, but there are marked differences. The respiratory organs are never in the form of branchiæ, but of pulmonary vesicles, or ramified tubes or tracheæ, in which they breathe air; there are never more than four pairs of locomotive limbs, and the abdominal sections never have limbs. The eyes are always sessile, while in the higher crustacea they are always borne upon movable peduncles, and both pairs of antennæ are developed. In the higher arachnidæ one of the two pairs of normal antennæ are never developed (Huxley). The arachnidæ comprise two great divisions, the trachearia and the pulmonaria.

DIVISION A. TRACHEARIA. Respiration cutaneous, or by tracheæ (q.v.). Eyes never more than four in number. The division comprises three orders.

Order I. Podosomata (Gr. *podes*, feet; *soma*, body). Included in arachnidæ by Cuvier, but placed by Milne-Edwards among the crustacea, on account of the metamorphoses which they undergo. Having, however, not more than four pairs of legs, they would seem more properly to belong to the arachnidæ. Among the best known are nymphon and pycnogonium. See PYCNOGONIDÆ.

Order II. Acarina or *Monomeresomata* (Gr. *akari*, a mite). Abdomen unsegmented and united with thorax and head into one mass. Respiration by tracheæ; most of the order are parasites. Usually divided into three families, of which the third, *acarida*, includes the mites and ticks (q.v.). See ACARUS and ACARUS FOLLICULORUM.

Order III. Adelarthrosomata (Gr. *adelos*, hidden; *arthros*, joint; *soma*, body). Abdomen composed of segments, but all three parts of the animal united in one mass. Respiration by tracheæ, opening on the ventral surface of the body. The order comprises three families: 1. *Phalangidæ* (q.v.), harvest spiders; 2. *Pseudoscorpionidæ* (q.v.), book scorpion; 3. *Solpugidæ*. In this family the abdomen is in distinct segments, and separated from the thorax.

DIVISION B. PULMONARIA. Higher arachnidæ, as scorpions and spiders. Respiration performed by pulmonary sacs, sometimes aided by tracheæ; six or more eyes; abdomen usually distinct from cephalothorax; divided into two orders.

Order I. Pedipalpi (Lat. *pes*, *pedis*, a foot; and *palpo*, to feel). Scorpions (q.v.) and other animals intermediate between scorpions and true spiders. In this order the abdomen is distinctly segmented, but there is no well-marked division between it and the cephalothorax. Family 1. *Scorpionidæ*; see SCORPION. Family 2. *Thelyphonidæ*, resemble true spiders externally, but are distinguished from them by having a segmented abdomen and no spinnerets, and from the scorpionidæ by the extremity of the abdomen having no sting.

Order II. Araneida. Characterized by the fusion of the head and thorax into one mass, and by an unsegmented abdomen, which is usually soft and joined to the rest of the body by a constricted peduncle. See SPIDER, TARANTULA, and MYGALE.

CLASS III. MYRIAPODA (q.v.). Divided into three orders.

Order I. Chilopoda (Gr. *cheilos*, lip; *podes*, feet; foot-lipped). Centipedes and their allies. See CENTIPEDE.

Order II. Chilognatha (Gr. *cheilos*, lip; *gnathos*, jaw). See MILLIPEDE.

Order III. Pauropoda. This order consists of one peculiar millipede, described by Sir John Lubbock under the name *pauropus*. The body is only one-twentieth of an inch long, consisting of ten segments. Found among decaying leaves in damp places,

in England and America. Fossil myriapoda; the oldest fossil myriapoda are in the carboniferous formation, where several species of millipedes have been found.

Order IV. Onychophora. In the West Indies, South Africa, South America, and New Zealand, there are peculiar animals of a genus called *peripatus*, which has been classed with leeches, tape-worms, and myriopoda. Their habits are terrestrial, living in decayed wood, under stones, and in moist earth. They have a cylindrical worm-like body, annulated and provided with many pairs of jointed feet, terminated with hooked claws or bristles. The respiratory organs, as recently shown by Moseley, are in the form of tracheæ, which open by numerous apertures.

CLASS IV. INSECTA. Those articulate animals (articulata or arthropoda) which have the head, thorax, and abdomen distinct; three pairs of legs on the thorax, none on the abdomen; a single pair of antennæ; eyes generally compound; usually two pairs of wings on the thorax; respiration by tracheæ. See INSECTS and LARVA. According as insects attain the adult state without passing through a partial or a complete metamorphosis, they may be arranged in three grand divisions: *Ametabola* (without change), *Hemimetabola* (half change), and *Holometabola* (whole change). It will answer the purpose here to simply arrange them into twelve orders, every one of which will naturally fall under one of the above divisions. The ametabola have been called *apterous insects* (q.v.).

Order I. Anoplura (Gr. *anoplos*, unarmed; *oura*, tail). Apterous insects (q.v.) in which the young pass through no metamorphosis; mostly parasitic, on man and other animals (lice, pediculi). Mouth suuctorial; body flattened; legs short, with claws; reproduction rapid. See LOUSE.

Order II. Mallophaga (Gr. *mallos*, a fleece, and *phago*, I eat). Aptera, in which the mouth is formed for biting, and furnished with mandibles and maxillæ. They resemble the pediculi, except as to mouth, not sucking the juices of their hosts, but living upon their integuments (bird lice).

Order III. Collembola. Minute aptera having a partial masticatory or suuctorial mouth, and the first abdominal segment furnished with a suuctorial tube, and next the last abdominal segment with peculiar leaping appendages. This order has been established by Sir John Lubbock for the reception of those insects called "spring-tails." Their scientific name, collembola, is given because they attach themselves to foreign bodies by means of their ventral suuctorial tube. See PODURA.

Order IV. Thysanura (Gr. *thysanoi*, fringes; *oura*, tail). Aptera generally having a masticatory mouth, and the extremity of the abdomen furnished with long, bristle-like appendages for locomotion, not springing. See LEPISMA.

Order V. Hemiptera (q.v.). Plant lice, cochineal insect. See APHIS, HOP FLY, FROTH FLY, COCCUS, COCHINEAL, COFFEE BUG, CICADA, LANTERN FLY, PHYLLOXERA, HARVEST BUG, HARVEST FLY, and WATER BUG.

Order VI. Orthoptera (q.v.). Grasshoppers, locusts, etc. See COCKROACH, CRICKET, MOLE CRICKET, MANTIS, GRYLLUS, EARWIG, PHASMIDÆ, WALKING STICK, and LOCUSTS AND GRASSHOPPERS.

Order VII. Neuroptera (q.v.). Wings four, all membranous, and nearly equal in size; lace-like in appearance; metamorphosis rarely complete; larvae six-legged. See MAY FLY, EPHEMERA, DRAGON FLY, ANT LION, CADDIS FLY, GOLDEN EYE-FLY, STONE FLY, and TERMITES.

Order VIII. Aphaniptera (Gr. *aphanos*, showing but little). Wings rudimentary, in the form of plates; mouth suuctorial; metamorphosis complete. See FLEA and CHIGOE.

Order IX. Diptera (q.v.). See also MUSCIDÆ, BOT, TABINIDÆ, CRANE FLY, CECIDOMYIA, HESSIAN FLY, HORSE FLY, HOUSE FLY, FOREST FLY, CHEESE HOPPER, CESRIDÆ, MAGGOT, SHEEP LOUSE, TURNIP FLY, and WHEAT FLY. This order comprises what are commonly known as flies.

Order X. Lepidoptera (q.v.). Butterflies and moths (q.v.). See CATERPILLAR, CABBAGE MOTH, CABBAGE BUTTERFLY, CODLIN MOTH, CORN MOTH, CLOTHES MOTH, DEATH'S-HEAD MOTH, GHOST MOTH, GOAT MOTH, GRASS MOTH, HAWK MOTH, PEA MAGGOT, PLUMED MOTH, WINTER MOTH, and TINIDÆ.

Order XI. Hymenoptera (q.v.). Wings four, membranous, with few nervures; wings sometimes absent; mouth always having maxillæ, which sometimes aid in forming a suuctorial mouth. The order is very extensive. See ANT, BEE, HORNET, WASP, HUMBLE BEE, CARPENTER BEE, GALL FLY, ICHEUMON, SAW FLIES, and SPHEGIDÆ.

Order XII. Strepsiptera (q.v.). These animals are minute parasites on bees, etc. The female is a soft grub without feet, but with a horny head, which it protrudes from between the abdominal segments of its host. The males are winged and active. The larvae are active, and have six feet.

Order XIII. Coleoptera (q.v.). Mouth having an upper lip, two mandibles, two maxillæ, and maxillary palpi; a movable lower lip with two jointed labial palpi. The larvae usually have thirteen segments, including the head. This order comprises the beetles. See CANTHARIS, CHAFER, COCKCHAFER, PINE CHAFER, BARK BEETLE, CLICK BEETLE, BLAPS, DARKLING BEETLE, COCONUT BEETLE, GOLIAH BEETLE, GOLDEN BEETLE, HERCULES BEETLE, PEA BEETLE, ROSE BEETLE, ROVE BEETLE, STAG BEETLE, DEATH WATCH, CLOVER WEEVIL, PEA WEEVIL, MEAL WORM, DYSTICUS, LAMELLI-

CORNES, HOP FLEA, FIREFLY, GLOWWORM, ELATER, MYLABRIS, TURNIP FLY, SCARABÆIDÆ, SCARABÆUS, WINE WORM, and XYLOPHAGA.

SUB-KINGDOM MOLLUSCA (Lat. *mollis*, soft). Soft-bodied animals, usually having a shell or exo-skeleton, and commonly known as shell-fish. The blood-circulating system is placed near the back, the nervous system near the ventral surface, the alimentary canal lying mostly between the two. When well developed, the nervous system consists of three principal nervous masses or ganglia. There is usually, but not always, a heart, or blood-propelling organ. The digestive system consists of a mouth, œsophagus or gullet, stomach and intestine and excretory orifice, though in some the latter organ is absent. The mouth in some is furnished with ciliated tentacles, as in polyzoa; in others with two ciliated arms, as in brachiopoda. In the bivalves, or *lamellibranchiata*, the mouth has four membranous palpi; sometimes it has a complicated system of teeth, as in *gasteropoda* and *pteropoda*. Generally there are salivary glands, and the liver is well developed, pouring the bile into the stomach or commencement of the gut. In the mollusca proper, kidneys have also been found. Blood colorless or very slightly tinged. In polyzoa the circulation is effected by the motion of cilia. In *tunicata* the heart is tube-like, and propels the blood periodically in either direction. In the higher orders there is always a distinct heart, which is systemic, consisting of an auricle and a ventricle. See MOLLUSCA. This sub-kingdom includes two great divisions called *molluscoidea* and *mollusca proper*, both comprising seven principal classes.

DIVISION A. MOLLUSCOIDEA. Nervous system consists of only one ganglion, or a pair with accessory ganglia; heart imperfect or absent. Divided into three classes: Polyzoa, tunicata, and brachiopoda.

CLASS I. POLYZOA (q.v.). See also PLUMATELLA.

CLASS II. TUNICATA (q.v.). See also ASCIDIA, PYROSOMIDÆ, and SALPA.

CLASS III. BRACHIOPODA (q.v.). Body protected by a bivalve shell lined by an integument or mantle. Mouth furnished with spirally coiled processes or arms. Ventral valve usually the larger of the two. All marine; commonly known as lamp-shells. See LAMP-SHELL. This class is divided into ten families.

Family 1. Terebratulidæ (Lat. *terebro*, to bore). See TEREBRATULA. Most of these mollusks commenced their existence in the paleozoic rocks, and have survived to the present time, but some are extinct.

Family 2. Thecididæ (Gr. *theke*, a sheath). These animals are attached to some object at the sea-bottom by the beak of the ventral, or larger valve. All the known species are included in the single genus *thecidium*, which commenced in the upper trias, and there is only one species which is not exclusively fossil.

Family 3. Spiriferidæ. See SPIRIFERS. These animals had a curiously constructed shell, and their remains are very interesting. They range from the Silurian to the Permian formations, and none have been found later than the lias.

Family 4. Koninckinidæ. The only genus known, *koninckina*, is represented by a single species, *K. leonhardi*, of the trias of St. Cassian.

Family 5. Rhynchonellidæ (Gr. *rhynchos*, a beak). Commencing in the lower silurian, one genus only remaining, *rhynchonella* (q.v.). The pentamerus (q.v.), an interesting fossil, ranges from the lower silurian to the carboniferous inclusive.

Family 6. Strophomenidæ. All exclusively paleozoic. Principal genera: *orthis*, *orthisina*, *Davidsonia*, *strophomena*, and *leptena*. See ORTHIS. The typical species of *orthisina* are silurian; but according to Davidson the genus ranges through the Devonian and carboniferous formations into the Permian.

Family 7. Productidæ. Shell attached to submarine objects by the beak or by means of spines borne by the ventral valve. Genus *echonetes*, found in silurian, Devonian, and carboniferous formations. *Producta* in Devonian to Permian.

Family 8. Craniadæ. This family contains only one genus, *crania*, which is found in the silurian and in all formations to the present time. The fossils are very beautiful and interesting.

Family 9. Discinidæ. Range from silurian to present time. A description of these interesting fossils may be found in the *Paleontology of New York*, by James Hall, and in Dana's *Manual of Geology*.

Family 10. Lingulidæ (Lat. *lingula*, a little tongue). Range from Cambrian period to the present time. Animal fixed by a muscular peduncle passing out between the beaks of the valves. Shell of horny texture, containing phosphorus in its composition. The genus *obolus*, a beautiful fossil, is confined to the silurian rocks. The present representative is *lingula* (q.v.).

DIVISION B. MOLLUSCA PROPER. Those members of the sub-kingdom mollusca which have three principal pairs of ganglia, distributed irregularly in position, and a heart which never has less than two chambers. They are naturally disposed into two groups—the *Acephala*, which have no distinct head, as the oyster and other *lamellibranchiata*; and the *Encephala*, in which there is a distinct head, as in the *gasteropods*, *pteropods*, and *cephalopods*. These three latter groups or classes have complicated arrangements of teeth upon the tongue, for which reason they have been given by Huxley the general name *odontophora*. The division *acephala* contains only one class.

CLASS I. LAMELLIBRANCHIATA (q.v.), (Lat. *lamella*, a plate; Gr. *branchia*, gills), called

by Lamarek *chonchifera*. These animals have no distinct head; body protected by a bivalve shell, as in the brachiopods, but the shells differ as much as the animals. In the brachiopods one shell is generally considerably larger than the other, while in the lamellibranchiates the two shells are generally of equal size. Again, in the brachiopods either one of the shells is symmetrical, or equilateral; that is, a line may divide it into two equal and relatively similar halves, while the valve of a lamellibranchiate is never quite equilateral. See SHELL. The respiratory organs are two lamelliform gills on each side of the body, whence the name of the class. Sometimes there is only one gill on each side. These gills, or plates, or branchiae, are composed of tubular rods and a network of capillary vessels. Externally they are furnished with vibratory cilia for the circulation of water over the surface. In some the margins of the mantle (the integumentary covering in all mollusca, and which secretes the shell, see MOLLUSCA) are united to form a closed branchial or respiratory chamber into which water is admitted and expelled by tubes called siphons. In others the margins of the mantle are free. The valves of the shell are brought together by one or two muscles, called adductors. Those having but one are called *monomyaria*, those having two, *domyaria*. Their habits are various; some lie on the bottom, as the oyster and scallop; others are fixed to objects, as mussels; others are sunk several inches deep in the sand on the sea-shore; others bore holes in rocks or wood, while many are free and locomotive. The lamellibranchiates are divided into two sections, with respect to the respiratory organs; those having the margins of the mantle free, without siphons, are with two exceptions called *asiphonida*, the other *siphonida*. Both sections comprise 21 families.

SECTION A. ASIPHONIDA.

Family 1. Ostreidae. Shell inequivalve and slightly inequilateral; a single adductor; mantle margins not united; *ostrea*, *recten*. See OYSTER and SCALLOP.

Family 2. Arcidae. Mantle margins free. See PEARL OYSTER, PINNA, and MALLEACEA.

Family 3. Mytilidae. Shell equivalve, mantle lobes united between the siphonal openings. One genus is *dreissena* (q.v.).

Family 4. Trigoniidae. Shell equivalve; mantle margins separated. See ARCA.

Family 5. Trigonidae. Shell equivalve, trigonal; mantle margin free. See TRIGONIA.

Family 6. Unionidae. Shell usually equivalve; mantle margins united between siphonal openings. See FRESH-WATER MUSSEL.

SECTION B. SIPHONIDA.

Family 7. Chamidae. Shell inequivalve; adductor impressions large; mantle margins united; siphonal orifices small. See CHAMA.

Family 8. Hippuritidae. Shell inequivalve, unsymmetrical, thick. See HIPPURITES and RADIOLITES.

Family 9. Tridacnidae (q.v.). Shell equivalve, large, and very beautiful; mantle margins extensively united; siphonal orifices surrounded by a thickened border. See CLAM, BEAR'S PAW.

Family 10. Cardiidae. Shell equivalve, heart-shaped, with radiating ribs; mantle open in front; siphons usually short. See COCKLE.

Family 11. Lucinidae. Fossils mostly found in secondary, tertiary, and recent formations, but some are Devonian and carboniferous. See LUCINA.

Family 12. Cyclidae. Shell sub-orbicular; mantle open in front; a single siphon, or two more or less united. *Cyclas* and *cyprea* are the two most important members, and date from the commencement of the cretaceous period to present time. They inhabit fresh water.

Family 13. Cyprinidae. (There is also a genus of fishes of this name.) Shell equivalved; mantle margins united behind by a curtain. The animals comprising this group are represented by Cyprina and Astarte. The latter has sometimes been assigned to the rank of a distinct family, Astartidae. See ASTARTE.

Family 14. Veneridae (q.v.).

Family 15. Mactridae. See MACTRA.

Family 16. Tellinidae (q.v.).

Family 17. Soleidae. See SOLEN.

Family 18. Myacidae. The more important genera are *mya*, *thetis*, and *panopaea* (q.v.).

Family 19. Anatinidae. Mantles more or less united; siphons long, more or less united. This family has considerable paleontological importance, numerous in paleozoic, and reaching a great development in secondary formations.

Family 20. Gastrochaenidae. Mantle margins thick in front; siphons long and united; burrowing in mud, and predaceous upon oysters and other mollusks, burrowing holes through their shells. Range from oolite to the present time. See ASPERGILLUM, GASTROCHAENA, and CLAVAGELLA.

Family 21. Pholadidae. Many fossil species are found in Jurassic rocks. The living genus, *xylonhaga*, includes the teredo (q.v.). See PHOLAS.

Encephalic division of mollusca, or cephalophora.

CLASS II. GASTEROPODA (q.v.). These animals never inhabit a bivalve shell. Many are naked, but the majority are provided with a univalve, sometimes with a multivalve shell. The gasteropods are divided into two primary sections, *pulmonifera* and *bracheli-*

fera, according as their respiratory organs are formed for breathing in free air or in water.

SECTION A. BRANCHIFERA. In this section the respiration is aquatic, by walls of the mantle cavity, or by gills. Divided into three orders.

Order I. *Prosobranchiata* (*Pectinibranchiata*). Branchiæ pectinated or plume-like and situated in advance of the heart, whence the name.

Section 1. *Siphonostomata* (q.v.). Margin of shell notched or produced into a canal. Comprises six families.

Family 1. *Strombidae* (q.v.).

Family 2. *Muricidae*. See MUREX, PURPLE COLORS, and FUSUS.

Family 3. *Buccinidae*. See PURPURA, HELMET SHELL, and WHELK.

Family 4. *Conidae*. See CONE SHELL.

Family 5. *Volutidae* (q.v.).

Family 6. *Cypraidæ*. See COWRY.

Section 2. *Holostomata*. Margin of shell seldom notched or produced into a canal.

Family 7. *Naticidae*.

Family 8. *Pyramidellidae*. See CHEMNITZIA.

Family 9. *Cerithiidae*.

Family 10. *Melaniidae*.

Family 11. *Turretellidae* (q.v.).

Family 12. *Littorinidae*, periwinkle (q.v.).

Family 13. *Paludinidae*, river snails, ampullaria, and paludina, the latter well known.

Family 14. *Neritidae*. Globose shell; long slender tentacles; mostly marine, and belonging to the tropics; one British species.

Family 15. *Turbanidae* (q.v.). Top shells. See PHEASANT SHELL and TROCHIDÆ.

Family 16. *Haloitidae*, ear-shells (q.v.). Shell spiral, ear-shaped. See HALIOTIS and IANTHINA.

Family 17. *Fissurellidae* (q.v.).

Family 18. *Calyptreidae*. See CALYPTREA.

Family 19. *Patellidae*. See LIMPET.

Family 20. *Dentalidae*. See DANTALIUM.

Family 21. *Chitonidae*. See CHITON.

Order II. *Opisthobranchiata*. Branchiæ placed toward the rear of the body, whence the name.

Section 1. *Tectibranchiata*. Branchiæ covered by a shell or mantle, a shell in most; sexes united.

Family 1. *Tornatellidae*. Cretaceous, principally.

Family 2. *Bullidae*. Bubble shells. See BULLA.

Family 3. *Aplysiidae*. Shell absent or rudimentary, and concealed by the mantle; animal slug-like (aplygia).

Family 4. *Pleurobranchidae*. Shell covers only the back of the animal. That of one species is known as the Chinese umbrella.

Family 5. *Phyllidiidae*. Shell absent.

Section 2. *Nudibranchiata* (q.v.). Animals destitute of a shell in the adult condition. Branchiæ external, on the back or sides of the body.

Family 6. *Doridae*. Sea lemons. See DORIS.

Family 7. *Tritoniidae*. Nearly allied to the preceding.

Family 8. *Aelidae*. See GLAUCUS.

Family 9. *Phyllirhoideae*.

Family 10. *Elysiaidae*, elysia, actæonia.

Order III. *Nucleobranchiata* (q.v.) or *Heteropoda*. Shell present or absent; animal free swimming, in the open sea, with a fin-like tail or flattened ventral fin.

Family 1. *Firolidae*. See FIROLA and CARINARIA.

Family 2. *Atlantidae*. See BELLEROPHON.

SECTION B. PULMONIFERA. See PULMONATA. Respiration aerial, by means of a pulmonary chamber.

DIVISION I. INOPERCULATA. Shell having no operculum.

Family 1. *Helicidae*. See BULIMUS.

Family 2. *Limacidae*. See SLUG.

Family 3. *Oncidiidae*. Shell absent; animal slug-like.

Family 4. *Limnæidae*. See LIMNÆA.

Family 5. *Auriculidae*. See AURICULA.

DIVISION II. OPERCULATA. Shell having an operculum.

Family 6. *Cyclostomidae*. Shell spiral; aperture nearly circular. All these animals are terrestrial, beginning in eocene.

Family 7. *Aciculidae*. Shell elongated, cylindrical.

CLASS III. PTEROPODA (q.v.). Open sea animals, swimming by means of wing-like appendages on each side of the neck. There is usually a symmetrical, glassy shell, muscular stomach, and well-developed liver. The heart has an auricle and a ventricle. Nervous system composed mainly of one ganglion below the gullet, with branches. Sexes united, young passing through a metamorphosis. Divided into two orders.

Order I. Thecosomata (Gr. *theke*, sheath, and *soma*, body). Having an external shell: respiratory organs contained in a cavity in the mantle.

Family 1. Hyaleidae. See HYALEA.

Family 2. Linacinidae. Shells minute, spiral; *spiralis*.

Order II. Gymnosomata (q.v.), (Gr. *gymnos*, naked; *soma*, body). See CLIO.

CLASS IV. CEPHALOPODA (q.v.). Divided into two distinct and well-marked orders.

Order I. Dibranchiata. Having two branchiae and an ink-bag; comprising two sections, Octopoda and Decapoda.

Section A. Octopoda. Having not more than eight arms, which are provided with sessile suckers.

Family 1. Argonautidae. See ARGONAUT.

Family 2. Octopodidae. See POULPE.

Section B. Decapoda (Gr. *deka*, ten; *podes*, feet). Arms eight, with two clavated tentacles, making ten; suckers pedunculated.

Family 3. Tenthidae. See HOOK SQUID.

Family 4. Belemnitidae. See BELEMNITES.

Family 5. Sepidae. See CUTTLE-FISH.

Family 6. Spirulidae.

Order II. Tetrabranchiata (q.v.). Having four branchiae (whence the name); no ink-bag; more than ten arms, and these without suckers.

Family 1. Nautilidae. See NAUTILUS.

Family 2. Ammonitidae. See AMMONITES, CERATITES, and BACULITES.

INVESTITURE (Lat. *in*, and *vestio*, to clothe), in feudal and ecclesiastical history, means the act of giving corporal possession of a manor, office, or benefice, accompanied by a certain ceremonial, such as the delivery of a branch, a banner, or an instrument of office, more or less designed to signify the power or authority which it is supposed to convey. The contest about ecclesiastical investitures is so interwoven with the whole course of mediæval history, that a brief account of its origin and nature is indispensable to a right understanding of many of the most important events of that period. The system of feudal tenure had become so universal that it affected even the land held by ecclesiastics, and attached to most of the higher ecclesiastical dignities, monastic as well as secular. Accordingly, ecclesiastics who, in virtue of the ecclesiastical office which they held, came into possession of the lands attached to such offices, began to be regarded as becoming by the very fact feudatory to the suzerain of these lands; and, as a not unnatural result, the suzerains thought themselves entitled to claim, in reference to these personages, the same rights which they enjoyed over the other feudatories of their domains. Among these rights was that of granting solemn investiture. Now, in the case of bishops, abbots, and other church dignitaries, the form of investiture consisted in the delivery of a pastoral staff or crosier, and the placing a ring upon the finger; and as these badges of office were emblematic—the one of the spiritual care of souls, the other of the espousals, as it were, between the pastor and his church or monastery—the assumption of this right by the lay suzerains became a subject of constant and angry complaint on the part of the church. On the part of the suzerains it was replied that they did not claim to grant by this rite the spiritual powers of the office, their function being solely to grant possession of its temporalities, and of the temporal rank thereto annexed. But the church-party urged that the ceremonial in itself involved the granting of spiritual powers; insomuch that in order to prevent the clergy from electing to a see when vacant, it was the practice of the emperors to take possession of the crosier and ring, until it should be their own pleasure to grant investiture to their favorites. The disfavor in which the practice had long been held found its most energetic expression in the person of Gregory VII., who having, in the year 1074, enacted most stringent measures for the repression of simony, proceeded, in 1075, to condemn, under excommunication, the practice of investiture, as almost necessarily connected with simony, or leading to it. This prohibition, however, as is observed by Mosheim (ii. 326), only regarded investiture in the objectionable form in which it was then practiced, or investiture of whatever form, when the office had been obtained simoniacally. But a pope of the same century, Urban II., went further, and (1095) absolutely and entirely forbade, not alone lay investiture, but the taking of an oath of fealty to a lay suzerain by an ecclesiastic, even though holding under him by the ordinary feudal tenure. The contest continued during the most of the 11th century. In the beginning of the 12th c., it assumed a new form, the pope, Paschal II., having actually agreed to surrender all the possessions and royalties with which the church had been endowed, and which alone formed the pretext of the claim to investiture on the part of the emperor, on condition of the emperor (Henry V.) giving up that claim to investiture. This treaty, however, never had any practical effect; nor was the contest finally adjusted until the celebrated concordat of Worms in 1122, in which the emperor agreed to give up the form of investiture *with the ring and pastoral staff*, to grant to the clergy the right of free elections, and to restore all the possessions of the church of Rome which had been seized either by himself or by his father; while the pope, on his part, consented that the elections should be held in the presence of the emperor or his official, but with a right of appeal to the provincial synod; that investiture might be given by the empe-

ror, but only by the touch of the scepter; and that the bishops and other church dignitaries should faithfully discharge all the feudal duties which belonged to their principality.

Such was the compact entered into between the contending parties, and for a time it had considerable effect in restraining one class of abuses; but it went only a little way towards eradicating the real evil of simony and corrupt promotion of unworthy candidates for church dignities. Still the principle upon which the opposition to investiture was founded was almost a necessary part of the mediaeval system, and Mosheim (ii. 327) regards it as "perfectly accordant with the religious principles of the age." It was, in fact, but one of the many forms in which the spirit of churchmanship has arrayed itself, whether in ancient or modern times, against what are called the Erastian tendencies which never fail to develop themselves under the shadow of a state church, no matter what may be its creed or its constitution.

INVESTITURE, the term used in Scotch law to denote the giving feudal possession of heritable property. It was formerly given to the vassal in presence of the *pares curia*, but latterly has been superseded by infestment or sasine, and now it is effected by mere registration of the deed of conveyance.

INVOCATION OF ANGELS AND SAINTS, the act of addressing prayers to the blessed spirits who are with God, whether the angels or the souls of the just who have been admitted to the happiness of heaven. The practice of addressing prayers to angels, especially to the angel-guardian, to the Virgin Mary, and to other saints, prevails in the Roman, the Greek, the Russo-Greek, and the eastern churches of all the various rites. In the Christian religion, the principle of the unity of God excludes all idea of subordinate sharers of the divine nature, such as is to be found in paganism, and all alike, Roman Catholics as well as Protestants, agree that its very first principles exclude the idea of rendering divine worship, no matter how it may be modified, to any other than the One Infinite Being. But while Protestants carry this principle so far as to exclude every species of religious worship and every form of invocation addressed to angels or saints, as trenching upon God's honor, and irreconcilable with the Scriptures, which hold him forth as the sole object of worship and the only fountain of mercy, the Roman Catholic religion permits and sanctions a worship (called *douleia*) of the saints, inferior to the supreme worship (*latreia*) offered to God, and an invocation of the saints, not for the purpose of obtaining mercy or grace from themselves directly, but in order to ask their prayers or intercession with God on our behalf. For this doctrine and the analogous practice, they do not advance the direct authority of Scripture (except a few passages which seem to them to imply the intercommunion of the two worlds, as Matt. xiii. 3, Luke xiv. 17, Exod. xxxii. 13), but rely on what to them is equally decisive testimony, viz., the unwritten word of God conveyed by tradition. Origen (Opp. ii. p. 273) speaks of the belief that "the saints assist us by their prayers" as a doctrine which is "doubted by no one." St. Cyprian, addressing the confessors going to martyrdom, engages by anticipation their prayers in his behalf when they shall have received their heavenly crown (Ep. 60, Dodwell's edition). To the same effect are cited the testimonies of Basil (Opp. ii. 155), Gregory Nazianzen (Opp. i. 288), Gregory of Nyssa (ii. 1017), Ambrose (ii. 200), Chrysostom (iv. 449), and many other fathers, as well as the liturgies of the various ancient churches, whether of the Roman, the Greek, the Syrian, or the Egyptian rite.

On the other hand, Protestant historians, even admitting the full force of these testimonies to the existence of the practice, allege that the practice is an early but unscriptural addition, dating only from the infusion into the church system of Alexandrian neoplatonism and oriental magianism, which they believe to have left traces even in the so-called orthodox Christianity of the 4th and 5th centuries. But leaving aside the doctrinal controversy, the fact at least is certain that in the 4th, and still more in the 5th and following centuries, the usage was universal; and a curious evidence of its prevalence is furnished by the fact that the very excess to which it was carried was condemned as a heresy (that of the Collyridians) by those who themselves confessed the lawfulness of the practice when confined within its legitimate limits. That similar excesses in the practice and similar abuses as to the nature and limits of the legitimate invocation of the saints continued through the mediaeval period, Roman Catholics themselves admit, although they allege that such abuses were at all times reprobated by the authentic teaching of the church; and the multiplied devotions to the saints, especially to the Blessed Virgin, the efficacy claimed for them, and the extraordinary legends connected with them, and the prominence which the worship had assumed in the church, were among the most fertile themes of invective with the first reformers. The council of Trent (25th Sess., *On the Invocation of Saints*) defines very precisely what is the doctrine of the Catholic church on this subject. It declares "that the saints who reign with God offer up their prayers to God for men; that it is good and useful suppliantly to invoke them, and to resort to their prayers, aid, and help, for the purpose of obtaining benefits of God through his Son Jesus Christ our Lord, who alone is our Redeemer and Savior." From this decree it is inferred that the Catholic doctrine on the saints does not prescribe the practice of invoking them as necessary or essential, but only as "good and useful," and that what is to be asked of them is not the direct bestowal of grace and mercy, as from themselves, but only their prayers, their assistance, and their

help in obtaining benefits from God; and although many forms of prayer which are in use among Catholics bear, especially to a Protestant reader, all the appearance of direct appeals to the saints themselves for the benefits which are implored, yet all Catholic authorities are unanimous in declaring that these forms of words are to be interpreted, and that, from habitual use, they are so interpreted, even by the most superficially instructed Catholics, with the understood explanation that all the power of the saints to assist us consists exclusively in their prayers for us, and seconding our prayers by their own. See Bellarmine, *Controversie de Sanctorum Beatitudine*, lib. i. cap. xvii.

Protestants object to the invocation of saints and of angels, that it is without evidence of divine authority, contrary to the whole tenor of Scripture, and derogatory to the mediatorship of Christ. They ask what reason can be adduced for believing that prayers addressed to saints are even *heard* by them, or that they have always a knowledge of the worship addressed to them? They further deny that the prayers addressed to saints—and particularly to the Virgin Mary—are always capable of explanation as merely an asking of their prayers on behalf of those who invoke them, and quote many instances in proof.

INVOICE, a list or account of merchandise or goods sold, either sent along with the goods themselves or separately.

INVOLUCRE (Lat. a wrapper or envelope), in botany, is a group of bracts surrounding flowers in their unexpanded state, and occupying a place on the floral axis beneath them after their expansion. The bracts which form an involucrum are generally grouped in a whorl. In umbelliferous flowers, there is very commonly an involucrum, not only to the umbel, but to each division of the umbel, or *umbellule*. The former is called the *general involucrum*, or simply the *involucrum*; the latter are *partial involucres*, or *involucels*. The cup of the acorn, hazel, chestnut, etc., may be regarded as an involucrum.

INVOLUTE. See EVOLOUTE.

INVOLUTION AND EVOLUTION are two operations the converse of each other. The object of the first is to raise a number to any power, which is effected by continuously multiplying the number by itself till the number of factors is equal to the number designating the power; thus, 2 raised to the third power is $2 \times 2 \times 2$, or 8; 7 raised to the fourth power is $7 \times 7 \times 7 \times 7$, or 2401, etc. Evolution, on the other hand, is the extraction of a root of any number, that is, it is a method for discovering *what* number, when raised to a certain power, will give a certain known number—e.g., the square root of 64 is 8, that is, 8 is the number which, raised to the second power, will give 64; 3 is the fourth root of 81, that is, 3 raised to the fourth power is 81, and so on. The symbols expressive of the two operations are as follows: 5^3 means that 5 is to be raised to the third power; $(7^2)^5$ means that the square or second power of 7 is to be raised to the fifth power; $\sqrt[2]{9}$ or $\sqrt[3]{9}$ or $9^{\frac{1}{2}}$ signifies that the extraction of the second or square root of 9 is required; $\sqrt[4]{256}$ or $256^{\frac{1}{4}}$, that the fourth root of 256 is to be extracted; and so on. Involution and evolution, like multiplication and division, or differentiation and integration, differ in the extent of their application; the former, or direct operation, can always be completed, while there are numberless cases in which the latter fails to express the result with perfect accuracy.

INYO, a co. of California, bounded w. by the Sierra Nevada, and e. by Nevada; 4,725 sq. m.; pop., '80, 2,928. One of the lofty peaks of the Sierra Nevada here is Mt. Whitney. Owens river flows into Owens lake, a large body of water. Part of the valley of the river is fertile. Gold, copper, tin, sulphur, and salt are found. The staple products are grain, hay, wool, and pork. There are some quartz and saw mills. Capital, Independence.

IO, in Greek mythology the daughter of Inachus or Iasus, and priestess of Juno at Argos, was loved by Jupiter, who, on account of Juno's suspicions, changed her into a white cow. Juno having obtained of him the cow as a present, set the hundred-eyed Argus to watch her. Mercury by command of Jupiter killed Argus and released her. Juno then sent a gad-fly, which pursued her until in her wanderings she reached Egypt, where she recovered her original form. The full account of this myth is found in the Prometheus of Æschylus. According to the usual explanation, Io symbolically represents the moon, Argus the stars, and Mercury the clouds.

IODINE (symb. I. equiv. 127) is one of a group of four non-metallic elements to which the term halogens (q.v.) has been applied. It derives its name from Gr. *iōdēs*, violet-like, in consequence of its magnificent purple color when in a state of vapor. At ordinary temperatures, it usually occurs in solid dark-gray glistening scales; it is, however, crystallizable, and sometimes appears as an octahedron with a rhombic base. It is soft, and admits readily of trituration, has the high specific gravity of 4.95, and evolves a peculiar and disagreeable odor, which indicates its great volatility. It fuses at 225° , and at about 350° it boils, and is converted into the purple vapor to which it owes its name; it has an acrid taste, and communicates a brownish-yellow color to the skin. It is very slightly soluble in water, but dissolves readily in watery solutions of iodide of potassium and of hydriodic acid, and in alcohol and ether. Iodine vapor is the heaviest of all known vapors, its specific gravity being 8.716. It combines directly with

pnosphorus, sulphur, and the metals. Its behavior with hydrogen is analogous to that of chlorine and bromine (see HYDROCHLORIC ACID), but its affinities are weaker than those of the last-named elements. It likewise combines with numerous organic substances, and the compound which it forms with starch is of such an intense blue color, that a solution of starch forms the best test for the presence of free iodine. By means of this test, one part of iodine may be detected when dissolved in one million parts of water.

The following are some of the most important iodine compounds. With hydrogen, it forms only one compound, *hydriodic acid* (HI), a colorless pungent acid gas, which in most respects is analogous with hydrochloric acid. It is obtained by the action of water on teriodide of phosphorus. The soluble iodides of the metals may be obtained by the direct combination of hydriodic acid with the metallic oxides, the resulting compounds being the metallic iodide and water. Some of these iodides are of extreme brilliancy, and others are of great value in medicine; amongst the latter must be especially mentioned iodide of potassium, iodide of iron, and the iodides of mercury.

Iodide of potassium is, next to quinine and morphia, the most important medicine in the pharmacopoeia. It crystallizes in colorless cubes, which are sometimes clear, but usually have an opaque whitish appearance, and are soluble in water and spirit. It is decomposed and the iodine set free, by chlorine, bromine, fuming nitric acid, and ozone (q.v.). There are various ways of obtaining this salt; the following is one of the best. If iodine be added to a warm solution of potash until a brown tint begins to appear, iodide of potassium (KI) and iodate of potash (KO, IO_5) are formed. By gentle ignition of the residue obtained by evaporation, the iodate is decomposed into iodide of potassium and oxygen, so that all that remains is fused iodide of potassium, which is dissolved in water and allowed to crystallize. Iodide of iron is formed by digesting iron wire or filings in a closed vessel with four times the weight of iodine suspended in water. Direct combination takes place, and a pale-green solution is formed, which by evaporation *in vacuo* yields crystals. It is the solution which is most commonly employed in medicine, but as, on exposure to the air, it becomes decomposed, and iodine is liberated, it is usually mixed with strong syrup, which retards this change.

There are two iodides of mercury, viz., the green sub-iodide (Hg_2I) and the red iodide (HgI). They may be formed either by the direct union of the two elements, or by the double decomposition of iodide of potassium and mercurial salts. There are two well-defined compounds of iodine and oxygen, viz., iodic acid (IO_5) and periodic acid (IO_7), corresponding to chloric and perchloric acid, neither of which are of any special interest.

Iodine in small quantity, and usually in combination with sodium, magnesium, or calcium, is very widely diffused over the earth's surface. It exists in sea-water, in marine animals and plants, and in certain mineral springs. It is also found in several minerals, as, for example, in certain Mexican silver ores, in Silesian zinc ores, in phosphorite from the Upper Palatinate, and in coal.

Iodine was discovered in 1811, by Courtois, in the waste liquors produced in the manufacture of carbonate of soda from the ashes of sea-weeds. A few years later, Gay-Lussac discovered that it was a simple elementary body. It is obtained from the half-fused ash of dried sea-weeds, which is known in this country as kelp (q.v.), and in Normandy as varek, and contains the iodides of sodium, potassium, magnesium, and perhaps calcium in considerable quantity. The iodine is liberated by the addition of binoxide of manganese and sulphuric acid. Most of our commercial iodine is prepared in Glasgow.

The preparations of iodine are employed extensively in medicine and in photography (q.v.). Iodide of potassium, and the preparations of iodine generally, are almost entitled to be regarded as specifics in cases of goitre, bronchocele, or Derbyshire neck. Out of 364 cases (collected by Bayle) which were treated with iodine, 274 were cured. Manson, Lugol, and others have shown the value of the iodine-treatment in scrofula. The preparations of iodine are also eminently successful as resolvents in chronic induration, and enlargement of the liver, spleen, uterus, etc. In many forms of chronic rheumatism, and in certain affections of the osseous system, due to a syphilitic taint, iodide of potassium is of the greatest service; and its value in the treatment of chronic lead-poisoning is not so generally known, even in the medical profession, as it deserves to be. The iodide of potassium dissolves the compounds of lead with albumen, fibrine, etc., which abound in the body in chronic lead-poisoning; and these dissolved compounds are excreted by the kidneys. In these cases, lead may often be detected in the urine, almost immediately after the administration of the iodide. This salt has a similar action in chronic mercurial poisoning, and cases are recorded of mercurial salivation having come on during the use of iodide of potassium, in consequence of the liberation of mercury, which had been previously fixed in the system.

Iodide of iron, which may be given either in syrup or in the form of Blancard's pills (an excellent French mode of administering this salt), is especially serviceable in scrofulous affections of the glandular system, in which the use both of iodine and of iron is indicated. The iodides of mercury have been prescribed with good effect in various forms of syphilis. They must be given with caution, on account of their energy, the average dose of the red iodide being a fraction ($\frac{1}{16}$ to $\frac{1}{4}$) of a grain. Pure iodine is seldom prescribed internally; but in the form of tincture and ointment, it is a

most useful topical application in cases of goître, local enlargements, diseases of joints, chillblains, etc.

In large doses, iodine and most of the iodides act as irritant poisons; but very few fatal cases are on record. In the event of poisoning with the tincture of iodine, the first point is to evacuate the stomach; and the vomiting is assisted by the copious use of tepid liquids, containing starchy matter, as, for instance, starch, flour, or arrow-root boiled in water; the object being to form iodide of starch, which is comparatively inert.

• **IODOFORM**, a substance of analogous composition to chloroform (q.v.), the chlorine in the latter being replaced by iodine, its formula being CHI_3 (using modern equivalent numbers). It is a solid, yellow crystallizable substance, obtained by the action of tincture of iodine upon an alcoholic solution of potash, the reactions being similar to those which take place in making chloroform by this method. It melts at 246.2° F. , but distills with the vapor of water at 212° . It possesses some of the anaesthetic properties of chloroform, but it has a wider use in medicine, being employed in those cases in which the action of iodine (q.v.) is indicated. At the same time it will relieve pain, and is therefore peculiarly applicable in cases of painful tumors. It is said to be a successful application to ringworm of the scalp, to ulcers of the cornea, and for promoting the healing of burns and blisters. Gastralgia, alone or connected with ulcer of the stomach, has been relieved by its administration, and different forms of external neuralgia are said to have been cured by it. The dose of iodoform is from one to three grains three times a day, given in the form of a pill. As an outward application it may be dissolved in glycerine or alcohol, or an oil; or it may be prepared in the form of an ointment. A common form for topical application is a solution of one part of iodoform in four parts of sulphuric ether.

ION, in Grecian mythology the reputed son of Xuthus and Creusa; but Euripides in his tragedy *Ion* makes him the son of Apollo.

IONA, the modern name of the most famous of the Hebrides, is believed to have originated in a mistaken reading of *n* for *u*; the word, in the oldest manuscripts, being clearly written *Ioua*. From the 6th c. to the 17th c. the island was most generally called *I*, *II*, *Ia*, *Io*, *Eo*, *Hy*, *Hi*, *Hii*, *Hie*, *Hu*, *Y*, or *Yi*—that is, simply, “the island;” or *Icolmkill*, *I-Columb-Kille*, or *Hii-Colum-Kille*—that is, “the island of Columba of the church.”

It is about 3 m. long, and varies in breadth from a mile to a mile and a half. In 1871 it had a pop. of 236. Its area, computed by Bede at “five families” (or “five hides of land,” as the passage is rendered in the Anglo-Saxon Chronicle), is estimated at 2,000 imperial acres, of which rather more than a fourth part is under tillage. The soil is naturally fruitful, and yields earlier crops than most parts of Great Britain, barley sown before the middle of June being ready for the sickle in August. This remarkable fertility was regarded as miraculous in the dark ages, and, no doubt, led to the early occupation of Iona. Dunii, the highest point of the island, is 330 ft. above the sea-level.

Its history begins in the year 563, when St. Columba (q.v.), leaving the shores of Ireland, landed upon Iona with twelve disciples. Having obtained a grant of the island, as well from his kinsman, Conall, the son of Comghall, king of the Scots, as from Br. ii, the son of Melchon, king of the Picts, he built upon it a monastery, which was long regarded as the mother-church of the Picts, and was venerated not only among the Scots of Britain and Ireland, but among the Angles of the n. of England, who owed their conversion to the self-denying missionaries of Iona. From the end of the 6th to the end of the 8th c. Iona was scarcely second to any monastery in the British isles; and it was this brilliant era of its annals which rose in Johnson’s mind when he described it as “that illustrious island which was once the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion.” But neither piety nor learning availed to save it from the ravages of the fierce and heathen Norsemen. They burned it in 795, and again in 802. Its “family” (as the monks were called) of 68 persons were martyred in 806. A second martyrdom, in 825, is the subject of a contemporary Latin poem by Walafridus Strabus, abbot of the German monastery of Reichenau, in the lake of Constance. On the Christmas evening of 986 the island was again wasted by the Norsemen, who slew the abbot and 15 of his monks. Towards the end of the next century the monastery was repaired by St. Margaret, the queen of king Malcolm Canmore. It was visited in 1097 by king Magnus the barefooted, of Norway. It was now part of that kingdom, and so fell under the ecclesiastical jurisdiction of the bishop of Man and the archbishop of Drontheim. In 1203 the bishops of the n. of Ireland disputed the authority of the Manx bishop, pulled down a monastery which he had begun to build in the island, and placed the abbey under the rule of an Irish abbot of Derry. The Scottish church had long claimed jurisdiction in Iona, and before the end of the 13th c. the island fell under the rule of the Scottish king. Its abbey was now peopled by Clugniac monks; and a nunnery of Austin canonesses was planted on its shores. Towards the end of the 15th c. it became the seat of the Scottish bishop of the isles, the abbey church being his cathedral and the monks his chapter.

No building now remains on the island which can claim to have sheltered St. Columba or his disciples. The most ancient ruins are the Laithrichean, or Foundations, in a little bay to the w. of Port-a-Churraich; the Cobhan Cuillich, or Cudees’s Cell, in

a hollow between Dunii and Duabhuirg; the rath or hill-fort of Dunbhuirg; and the Gleann-an-Teampull, or Glen of the Church, in the middle of the island, believed to be the site of the monastery which the Irish bishops destroyed in 1203. St. Oran's chapel, now the oldest church in the island, may probably be of the latter part of the 11th century. St. Mary's nunnery is perhaps a century later. The cathedral, or St. Mary's church, seems to have been built chiefly in the early part of the 13th century. It has a choir, with a sacristy on the n. side, and chapels on the s. side; n. and s. transepts; a central tower, about 75 ft. high; and a nave. An inscription on one of the columns of the choir appears to denote that it was the work of an Irish ecclesiastic who died in 1202. On the n. of the cathedral are the chapter-house and other remains of the conventional or monastic buildings. In the "Reilig Oran"—so called, it is supposed, from St. Oran, a kinsman of St. Columba, the first who found a grave in it—were buried Ecgfrid, king of Northumbria, in 684; Godred, king of the Isles, in 1188; and Haco Ospac, king of the Isles, in 1228. No monuments of these princes now remain. The oldest of the many tombstones on the island are two with Irish inscriptions, one of them, it is believed, being the monument of a bishop of Connor who died at Iona in 1174.

After centuries of neglect this interesting island seems now to be in the way of improvement. It possesses a church connected with the establishment, also a free church, and a school. A small and commodious inn—the St. Columba—was erected in 1863 by the duke of Argyll, the proprietor of Iona; by which means tourists and antiquarian explorers are enabled to make visits of satisfactory duration. During summer steamers from Oban (see HEBRIDES) call at Iona twice a week; they land passengers by boats at Baile Mor, the only village on the island, and usually allow time for visiting the ruins. See the duke of Argyll's *Iona* (1871).

IONA ISLAND, a small island in the Hudson river, in Rockland co., about 40 m. from New York. It has extensive vineyards, and is a popular resort for excursions.

IO'NIA, the ancient name of the most flourishing country of Asia Minor. It received its name from the Ionians (one of the four most ancient tribes in Greece), who, again, according to the mythological account, derived theirs from Ion, the son of Apollo by Creusa, a daughter of a king of Athens. According to the usually received tradition, they were driven out of the Peloponnesus by the Achaians, and removed to Attica, whence, about 1050 b.c., bands of them went forth to settle on the coast of Asia. Ionia was a beautiful and fertile country, extending, according to Ptolemy, from the river Hermus to the river Meander, along the coast of the Ægean sea, but Herodotus and Strabo make it somewhat larger. It soon reached a high point of prosperity; agriculture and commerce flourished, and great cities arose, of which Ephesus, Smyrna, Clazomenæ, Erythrae, Colophon, and Miletus were the most celebrated. These free cities, which formed the nucleus of the IONIAN LEAGUE, were, however, gradually subdued by the kings of Lydia, and passed (557 b.c.) under the sway of the Persians, but were allowed a considerable measure of internal liberty. During the great Persian war, the contingent which they were compelled to furnish to their oriental masters deserted to the Greeks, at the battle of Mycale (479 b.c.), whereupon the Ionians entered into an alliance with Athens, upon which they now became dependent. After the Peloponnesian war, they were subject to the Spartans, and again (387 b.c.) to the Persians till the time of Alexander the great. From this period, Ionia shared the fate of the neighboring countries, and in 64 b.c. was added to the Roman empire by Pompey, after the third Mithridatic war. In later times, it was so ravaged by the Turks that few traces of its former greatness are now left.—The *Ionians* were regarded as somewhat effeminate. They were wealthy and luxurious, and the fine arts (see IONIC ARCHITECTURE) were cultivated amongst them at a much earlier date than amongst their kinsmen in the mother-country. The *Ionic Dialect* excels the other Greek dialects in softness and smoothness, chiefly from the greater number of vowels introduced.

IONIA, a village of Michigan, on Grand river, and on the Detroit and Milwaukee railroad, 38 m. n.w. of Lansing; pop. 3,251. It has 8 churches, 2 national banks, a high school, a public park, a state-prison, 2 iron foundries, a brewery, a pottery, a brickyard, 2 flouring mills, railroad repair-shops, and 2 newspapers.

IO'NIA, a co. in central Michigan; 576 sq.m.; pop. '74, 28,376. It is watered by Grand, Flat, Maple, and Looking-glass rivers. The surface is undulating, and there are extensive forests of beech, pine, and sugar-maple. The soil is generally fertile. The chief products are wheat, maize, oats, hay, wool, and lumber. The Detroit, Lansing and Lake Michigan, and the Detroit and Milwaukee railroads intersect the county. There are numerous manufactories for carriages, agricultural implements, saddlery, sash, doors and blinds, and woolen goods; also flour and saw mills. Cap., Ionia.

IO'NIAN ISLANDS, a group, or rather chain, running round the w. coast of Epirus, and w. and s. of Greece. It consists of about 40 islands, of which Corfu, Paxo, Santa Maura, Theaki, Cephalonia, Zante, and Cerigo, are of considerable size; the total area is about 1000 sq.m., and the pop. '70, 218,879, is mostly of Greek descent. The surface is generally mountainous, the plains and valleys being fertile. The collective term "Ionian" is of modern date. After the division of the Roman empire these islands were included in the eastern half, and so continued till 1081, when the duke of Calabria (subsequently

king of Naples) took possession of them. From this time they underwent a continual change of masters, till the commencement of the 15th c., when they by degrees came into the possession of the Venetians, who in 1797 ceded them to France. They were seized by Russia and Turkey in 1800, by France in 1807, by Britain in 1809, and on Nov. 5, 1815, were formed into a republic ("The Septinsular republic") under the protectorate of the latter. While they were connected with England, the government was carried on by two assemblies, and the *lord high commissioner*, who was the representative of her majesty. The *lower assembly* consisted of 40 members, who required to be nobles; 29 were elected by the islanders themselves, and 11 by the lord high commissioner; their term of office was five years, during which period they held three sessions, of three months each. The *senate*, composed of five members, which the commissioner had power to increase to seven, formed the executive. The commissioner was invested with extensive powers; he could convoke an extraordinary meeting of parliament, confirm or reject the resolutions of the senate, and veto all bills passed by the legislature. Up to 1848 the press was restricted, and the government was really a despotism, but in that and the following year widespread dislike of the English government became apparent. To remove what were supposed to be grievances, lord Seaton, then lord high commissioner, introduced sweeping changes in the constitution, including vote by ballot, lowering of the franchise, and freedom of the press. A demand was then made for annexation to the kingdom of Greece, and an insurrection broke out in Aug., 1849, in Cephalonia. It was suppressed by sir Henry Ward, who had succeeded lord Seaton, with what was considered by some persons as undue severity. Fresh concessions were granted, but without appeasing the malcontents. In the end of 1858, Mr. Gladstone was sent as a special commissioner to ascertain what could be done to meet the claims of the population. But he found that they would be satisfied with nothing but annexation to Greece. There was no great desire on the part of the English government to continue their connection with the Ionian islands. They had cost the United Kingdom £100,000 per annum, and had been a perpetual source of annoyance. In 1863 the election of the son of the king of Denmark as constitutional king of Greece supplied England with an opportunity of getting rid of this troublesome dependency. On March 29, 1864, a treaty was concluded at London by which they were annexed to Greece, and since this period they have formed a province of the Hellenic kingdom. In Feb., 1867, they were visited by a series of shocks of earthquake, most violent in Cephalonia, where they caused great destruction of life and property, and almost destroyed the two chief towns. See Murray's *Handbook for Greece and the Ionian Islands*, by R. G. Watson, 4th edition, 1872.

IONIAN MODE, in music, one of the old church modes, said to be the same as the ancient Greek mode of that name, and the only one of the old church modes which agrees with our modern system of music, the Ionian mode being the same as our key of C major. The character of the Ionian mode, however, must have appeared to the ancients more properly defined than it can to us, as it was the only one of their modes which had a major third and a sharp seventh.

IONIAN SEA, a name anciently given to that part of the Mediterranean which washed the shores of Greece and Epirus, separating them from Italy and Sicily. It is connected with the Adriatic by the strait of Otranto. The name is found first in *Aeschylus*, but its origin and exact meaning are doubtful.

IONIC ARCHITECTURE, a style of Greek architecture which took its origin in Ionia, and seems to have derived many of its characteristic features from Assyria. See **Grecian Architecture**. The chief peculiarity of Ionic architecture, is the capital of the columns (q.v.), which is decorated with spiral ornaments called volutes (q.v.). The columns have also bases, which were not used in Doric architecture. The cornice is distinguished by the dentil band, an ornament first introduced in this style. The honeysuckle ornament (q.v.), so much used in Ionic architecture, is one of the features which indicate its eastern origin.

Many large temples were erected in this style in Asia Minor and Greece. Among the finest examples now existing are the temples of Erechtheus and Minerva Polias on the Acropolis at Athens, Apollo Didymæus at Miletus, Minerva Polias at Priene, and Bacchus at Teos; and the temple of Fortune at Rome.

IONIC SCHOOL is the collective name given to the earliest Greek philosophers, Thales, Anaximander, Anaximenes, Heraclitus, and Anaxagoras, on account of their following one general tendency, and belonging for the most part to Ionia. See the biographies of these philosophers.

IONIES, a small tribe of Indians of the family of the Caddoes, and said by Spanish writers to be a part of the confederacy known as the Texas. They consider the Hot springs of Arkansas as their original abode, whence they afterwards removed to Texas. They are a peaceful tribe, and cultivate the land for their support. In 1859 they were removed by the government to a district on the Wachita river, Indian territory.

IOS'CO, a co. in s. Michigan, on lake Huron and Saginaw bay; 550 sq.m.; pop. '70, 3,163. It is intersected by the Au Sable and Au Gres rivers. It is nearly level, and has extensive forests of pine trees. There are many saw mills, and the principal export is lumber. Cap., Tawas city.

I. O. U., a memorandum of debt given by a borrower to a lender, so called from being made in this abbreviated form:

LONDON, January 1, 1878.

Mr. A. B.,

I. O. U. £20.

C. D.

It is a convenient document, because it requires no stamp, and yet it is valuable evidence of the existence of the debt, in case an action is afterwards brought. If, however, the I. O. U. contain any promise to pay the debt, then it will amount to a promissory-note, and be void unless it have a stamp.

IOWA, one of the United States of America, was organized as a state, with governor and legislature, in 1846. It lies between $40^{\circ} 20'$ and $43^{\circ} 30'$ n. lat., and $90^{\circ} 12'$ and $96^{\circ} 53'$ w. long., and extends 208 m. from n. to s., and 300 from e. to w., with an area of 55,045 sq m., or 35,228,800 acres. It is bounded on the n. by Minnesota; e. by Wisconsin and Illinois, from which it is separated by the Mississippi river; s. by Missouri; and w. by the state of Nebraska, from which it is separated by the Missouri river. It has 99 counties, with Des Moines for its capital. The pop. in 1840 was 43,112; in 1850, 192,214; in 1860, 674,948; in 1870, 1,182,933. The rivers are the Mississippi and Missouri on its eastern and western borders, and the Des Moines, Iowa, Red Cedar, and their branches. The surface is undulating and beautiful, with alternate forests and prairies. There are no mountains; but bold bluffs, with picturesque ravines, line the rivers. In the n.e. there are rich deposits of lead, and coal in the s. and w., with iron, marble, clay, gypsum, etc. The soil is exceedingly fertile; and the climate healthful; the peach blossoms in the middle of April, but the winters are severe, with an average of 26° . The chief productions are wheat, maize, flax, tobacco, cattle, and hogs. It has not much direct foreign commerce, but trades extensively with the Atlantic and gulf towns, and with the interior. The chief river ports of Iowa are Keokuk, Fort Madison, Burlington, Muscatine, Davenport, Clinton, Bellevue, and Dubuque. There are many manufactories, and in 1875 there were 3,767 m. of railway. In 1870 there were 7,322 public schools, 49 colleges, and 103 other schools, with a total attendance of 217,654.

IOWA (*ante*) is the most purely agricultural of all the United States. The beauty of its scenery, the evident fatness of its soil, its natural good drainage, attracted the best class of farmers and business emigrants from the north-eastern states, filling it with a population of great thrift, energy, and intelligence. Midway between the Atlantic and Pacific oceans, drained e. by the Mississippi and w. by the Missouri, and in the zone of the greatest movement of migration, it became populous with a rapidity never before equaled in the history of states so purely agricultural, or which have no extraordinary city growth; and its wealth and population are distributed with remarkable uniformity.

History.—Iowa was originally a part of the immense territory included in Louisiana, and ceded to the United States in 1803. Its name, signifying in the Indian language "the beautiful country," is derived from the river so designated. The first white settlement within the limits of the state was made in 1788 by Julian Dubuque, a Frenchman from Canada, who obtained a grant of a large tract, including the city now bearing his name, and the rich mineral lands surrounding it. He built a fort, carried on the mining of lead, and traded with the Indians until his death in 1810. In 1834 the territory now constituting the state of Iowa was placed under the jurisdiction of Michigan, and in 1836 under that of Wisconsin. In 1833 settlements were made near Burlington by companies from Illinois and other states, and, a few years later, at other points along the Mississippi. In 1838 the territory of Iowa was organized in due form, the seat of the government being fixed at Burlington. It included within its boundaries at that time the greater part of the present state of Minnesota, and the whole of Dakotah territory. In 1839 the government was removed to Iowa city. In 1844 a state constitution was framed and admission to the union prayed for; but congress was dissatisfied with the boundaries assumed, and therefore denied the petition. Soon afterwards congress defined the boundaries that would be acceptable, and they were approved by the people of the territory; and on Dec. 28, 1846, the new state was admitted to the union. In 1857 the capitol was fixed at Des Moines. The constitution at present in force was adopted in 1857. According to the state census of 1873 the pop. was 1,251,333; number of families, 238,098; dwellings, 231,540; voters, 261,205. In 1870 there were 24,115 persons 10 years old and upward who could not read, and 45,671 who could not write; and of these illiterates, 24,979 were of native, and 20,692 of foreign birth.

The state is well watered, its streams being all affluents of the great rivers which bound it on the e. and west. The Des Moines, the Checaque or Skunk, and the Iowa and its affluents flow into the Mississippi. Those flowing into the Missouri are the Big Sioux (forming a part of the w. boundary), the Chariton, Grand, Platte, Nodaway, and Nishnabatona. The Iowa rises in Hancock co., in the northern part of the state, and joins the Mississippi 35 m. above Burlington. It is nearly 300 m. long, and is navigable 80 m. to Iowa city. The largest of the interior rivers is the Des Moines, which has a course of 300 m. within the state, draining upwards of 10,000 sq.m. of territory. Next to the Des Moines in size is the Red Cedar, which rises in Minnesota, and empties into the Iowa. In the northern portion of the state are many small but picturesque

lakes, of the same kind as those so numerous in Minnesota. The largest of these is lake Okobojo, in Dickinson co., 15 m. long, and from one-fourth of a m. to 2 m. wide. The southern portion of the state is especially beautiful in its undulations, which are intersected by the larger rivers with their fertile valleys. In the n.e. the surface is more elevated, and there are hills and mounds covered with oaks, while the rivers sometimes tumble over precipitous walls of rock. Lead ore and other metals are found in this section in abundance, while the land is of an excellent quality. The prairies of the state are of great extent, and unrivaled beauty and fertility. Coal is found in abundance in the s. and w. portions of the state, the measures extending over an area of 20,000 sq.miles. Extensive beds of superior peat are found in the northern part of the state. The lead-mine tract is in a belt occupied by Galena limestone, which touches the Mississippi at Dubuque, and lies along the valley of the Turkey river in a n.w. direction. The mines have been worked only in the immediate vicinity of Dubuque, where they are very productive. From 4,000,000 to 6,000,000 lbs. of ore, yielding 70 per cent of lead, have been smelted there annually for some time past. Small deposits of iron ore are found in some parts of the state, and a deposit of gypsum of great purity exists upon a small area near Fort Dodge. Building-stone of excellent quality is abundant. The soils of the state are generally very good, and there is but little inferior land. The valleys of the Iowa, Red Cedar, and Des Moines, especially, are of unrivaled fertility. The climate is well adapted to agricultural operations. The winters, owing to the prevalence of n. and n.w. winds, to which nature offers no obstruction, are severe; but the winds of the summer, which are equally free, serve to temper the heat. The mean temperature of the year is 48°; spring, 47½; summer, 70½; autumn, 45; winter, 23½. There is probably no healthier country than Iowa in the world, a fact which may safely be attributed to the excellent drainage afforded by its streams and its undulating surface. The southern part of the state, along the rivers, is well wooded. In the northern portion trees are comparatively scarce, though groves of pine and cedar are found in some places. The most common trees are ash, elm, sugar and white maple, hickory, walnut, oak, poplar, and basswood. Of fruit trees, the apple, pear, and cherry grow in perfection. The wild grape, plum, and gooseberry are indigenous.

The state, agriculturally considered, is in the foremost rank. For the cultivation of the cereals it is unsurpassed. Potatoes grow in great perfection, and the soil and climate are also favorable for flax, tobacco, and the castor-oil plant. In Crawford co., in the western part of the state, some experiments have been made in tea-culture, and 700 lbs. to the acre have been produced. In 1870 the state contained 9,396,467 acres of improved land, 2,524,796 of woodland, and 3,620,533 of other unimproved land. The number of farms was 116,292, of which 34,041 contained from 20 to 50 acres; 41,372 from 50 to 100; 30,142 from 100 to 500; 321 from 500 to 1000; and 38 over 1000. The cash value of these farms was \$392,662,441; of farming machinery and implements, \$20,509,582; wages paid during the year, \$9,377,878; estimated value of all farm productions, \$114,386,441; value of orchard products, \$1,075,169; of garden products, \$244,963; of forest products, \$1,200,468; of animals slaughtered or sold for slaughter, \$25,781,223; of live-stock, \$82,987,133; of home manufactures, \$521,404. The number of horses was 433,642; of mules and asses, 25,485; of milch cows, 369,800; of other cattle, 614,366; of sheep, 855,493; of swine, 1,353,908. The number of live-stock assessed for valuation in 1878 was: cattle, 1,530,056; horses, 672,808; mules, 42,566; sheep, 301,743; swine, 2,324,116. The amount of agricultural productions in 1870 was: wheat, 29,435,692 bush.; corn, 21,005,142; rye, 505,807; oats, 21,005,142; barley, 1,960,779; buckwheat, 109,432; peas and beans, 42,313; potatoes, 591,462; sweet potatoes, 34,292; clover seed, 2,475; grass seed, 53,432; flax seed, 88,621; hay, 1,777,389 tons; tobacco, 71,792 lbs.; wool, 2,967,-043; butter, 27,512,179; cheese, 1,087,741; maple sugar, 146,490; hops, 171,113; flax, 695,518; honey, 853,213; wine, 37,518 gallons; sorghum molasses, 1,218,635. In 1872 the improved lands had increased to 9,987,788 acres. The production of wheat in that year was 32,437,836 bush.; of corn, 141,744,522; of oats, 22,113,013; of barley, 5,770,169; of wool, 2,348,884 lbs.

The statistics of manufactures in 1870 presented these figures: Number of establishments, 6,566; capital invested, \$22,420,183; wages paid, \$6,893,292; persons employed, 25,032, of whom 23,395 were males above 16, and 951 females above 15 years of age; value of products, \$46,534,322. The principal industries were: agricultural implements, blacksmithing, boots and shoes, carpentering and building, carriages and wagons, flouring mills, furniture, malt liquors, lumber, pork packing, saddlery and harness, and woolen goods.

The state, while it has no direct foreign commerce, has an extensive trade with Atlantic ports and with the interior. There are three United States ports of delivery—Burlington, Dubuque, and Keokuk. The tonnage in 1870 was 5,489, mostly at Dubuque, where there is some ship-building. In 1873 there were in the state 75 national banks, with a capital of \$6,017,000, and a circulation amounting to \$5,674,385. The number of savings banks in 1877 was 20, with assets amounting to \$3,301,209; liabilities, including capital stock, \$3,104,614; undivided profits, \$196,594. There were at the same time 31 banks of issue and deposit organized under state law, with assets amounting to \$3,190,063.

Railways.—Iowa is in the direct line of trans-continental commerce. Five great

railways traverse the state from e. to w. and connect directly or indirectly with the Union Pacific railroad. These are, beginning from the s., the Chicago, Burlington, and Quincy, entering the state e. at Burlington and w. at Council Bluffs; the Chicago, Rock Island, and Pacific, entering e. at Davenport and w. at Council Bluffs; the Chicago and North-western, entering e. at Clinton and w. at Council Bluffs; the Illinois Central, entering e. at Dubuque and w. at Sioux City; and the Milwaukee and St. Paul, entering e. at McGregor and w. at Council Bluffs. Besides these e. and w. roads, other lines of roads, together with the ramifying branches of those already named, form a system of connections southward and south-easterly towards the Mississippi and Missouri rivers and St. Louis. These are: the Chicago, Clinton, and Dubuque, and the Dubuque and Minnesota, on the w. bank of the Mississippi from Clinton on the s. to the northern boundary of the state; the Davenport and St. Paul, the Burlington and Minnesota, the Burlington, Cedar Rapids, and Minnesota, the Central of Iowa, the Keokuk and Des Moines, and Des Moines and Fort Dodge, the Sioux City and St. Paul, and the Sioux City and Pembina. From the older of these roads there are many branches, so that there are few farming districts in the state more than 20 m. from a railway. In its early settlement the territory relied largely on the Mississippi and Missouri rivers, which bound it e. and w., as outlets for its products. Now its network of railways convey most of its surplus eastward and distribute merchandise from older states almost at the producers' doors. The new territories and mining regions westward also consume a part of its surplus. The value of railroad property in the state in 1879 was \$22,540,904, miles of track, 3,922; capital stock, \$90,612,451; aggregate debt of all the roads, \$70,243,795; earnings for the year ending June 30, 1879—passengers, mail, and express, \$5,335,177; freight, etc., \$16,005,532—total, \$21,340,700; expenses, \$12,904,420; net earnings, \$8,436,288. The aggregate amount of taxes paid by the roads in 1878-79 was \$584,169. There are in the state over 1200 m. of steel rail. The miles of track of some of the principal roads in the state are as follows: Chicago, Rock Island, and Pacific, 310; Burlington, Cedar Rapids, and Minnesota, 248; Burlington and Missouri River, 292; Central of Iowa, 189; Chicago and North-western, 272; Des Moines Valley, 249; Illinois Central, 403. All railroad property is taxable at the same rates and in the same manner as that of individuals, and the state exercises a thorough supervision over the roads to prevent unjust discriminations in rates of fare and freight. The government canal, constructed around the Des Moines rapids at Keokuk, was opened in 1877. It is 7½ m. long and 300 ft. wide, and has three locks, each 350 ft. long. It cost not far from \$4,400,000.

The debt of the state is \$545,435, nearly half of which is due to the permanent school fund.

The public institutions maintained by the state are the college for the blind at Vinton; the school for the deaf and dumb at Council Bluffs; the hospitals for the insane at Mount Pleasant and Independence; the soldiers' orphans' homes at Cedar Falls, Davenport, and Glenwood; the reform school for boys at Eldora, and one for girls near Salem; and two penitentiaries, one at Fort Madison, the other at Anamosa. The common school system is under the joint direction of state and county superintendents and district directors. The number of persons of school age (between 5 and 21) in the state in 1878 was 577,353; number enrolled, 431,317; number in attendance, 264,702. The number of school districts in 1873 was 2,536; graded schools, 419; schools ungraded, 8,397; school-houses, 8,856; number of teachers—males, 6,091; females, 10,193—total, 16,284; average monthly compensation of male teachers, \$36.28; of females, \$27.68. The number of private schools was 121; of their teachers, 364; of their pupils, 12,132. The amount of the permanent school fund in 1873 was \$3,294,742, producing an income of \$275,789; total expenditure in that year for school purposes, \$4,229,455, of which \$2,248,676 was for the salaries of teachers. There is no state school devoted exclusively to the training of teachers. Among the higher institutions of learning in the state are the following: The state university at Iowa City, and the state agricultural college at Ames, both under the patronage of the state; Upper Iowa University at Fayette, Methodist; Tabor College at Tabor, Congregational; German college at Mt. Pleasant, Methodist; Iowa Wesleyan university at Mt. Pleasant, Methodist; Whittier college at Salem, Friends; Humboldt college at Springvale; Cornell college at Mt. Vernon, Methodist; Western college at Western, United Brethren; Oskaloosa college at Oskaloosa, Disciples; Central university of Iowa at Peila, Baptist; Amity college at College Springs; university of Des Moines at Des Moines, Baptist; Iowa college at Grinnell, Congregational; Penn college at Oskaloosa, Friends; Simpson Centenary college at Indianola, Methodist; Norwegian Luther college at Deborah, Lutheran; and Burlington university at Burlington. The whole number of professors and teachers in these institutions in 1873-74 was 168, of students 3,570. The agricultural college admits students of both sexes and unites manual labor with study. The number of libraries in the state, according to the census of 1870, was 3,540, of which 2,387 were private; volumes in the public libraries, 377,851; in the private libraries, 295,749. The chief of the public libraries are the state library at Des Moines and the state historical library at Iowa City. According to the state census of 1873, periodicals published in Iowa were 22 daily, 2 tri-weekly, 6 semi-weekly, 272 weekly, 2 semi-monthly, 19 monthly, and 1 bi-monthly. The number of religious organizations, according to the census of 1870,

was 2,763; church edifices, 1446; church property, \$5,730,352. The chief denominations are the Baptist, Christian, Congregational, Episcopal, Friends, Jews, Lutheran, Methodist, Presbyterian, Reformed, Roman Catholic, Second Advent, United Brethren in Christ, Universalist, and Unitarian.

The general election is held on the 2d Tuesday in Oct., except in the years of the presidential election, when it occurs on the Tuesday next after the first Monday in November. The governor and lieutenant-governor are elected for 2 years by a plurality of the popular vote. The salary of the former is \$3,000 per annum. The legislature consists of a senate of 50 members elected for 4 years, half of them biennially, and a house of 100 members elected biennially. The sessions are biennial, occurring in the even years. Senators must be 25 years of age, representatives 21 years, and the governor and lieutenant-governor 30 years. The secretary of state, auditor of state, register of state land office, and superintendent of public instruction are elected for 2 years, and each has a salary of \$2,200. The governor appoints the adjutant- and inspector-general and the state librarian for terms of 2 years. The supreme court consists of four judges, elected by the people for 6 years, one every second year, and the one having the shortest time to serve is chief-justice. Judges of the district court are elected in single districts for 4 years. The judges of the supreme court receive a salary of \$4,000, those of the district court \$2,200 per annum. Circuit courts, consisting of a single judge, are held by the district court judges. The constitution prohibits the lending of the credit of the state for any purpose, or the borrowing of more than \$250,000 at any one time, but permits a larger debt to be contracted to repel invasion or suppress insurrection. No corporation can be created by special law, and stockholders in banks are individually liable to double the amount of their stock. The legislature is prohibited from granting divorces or authorizing lotteries. The property rights of husbands and wives are equal, each upon the death of the other inheriting one third in value of his or her real estate, while neither is liable for the separate debts of the other. The contracts made by the wife in her own name are enforced by or against her precisely as if she were unmarried. A married woman may sue and be sued without the husband being joined in the action. Women are by law eligible to all offices connected with public schools. The state offers a premium for the planting of forest trees by deducting a certain sum from the taxes of citizens in proportion to the number of trees they may set out. The amount of property thus exempted from taxation for the years 1879 and 1880 is estimated at nearly \$6,000,000. A new state capitol is nearly completed. Its greatest length is 263 ft., and its greatest width 246 feet. It is estimated to cost not far from \$2,000,000. The electoral votes of Iowa for president and vice-president of the United States have been cast as follows: 1848, 4 for Cass and Butler; 1852, 4 for Pierce and King; 1856, 4 for Fremont and Dayton; 1860, 4 for Lincoln and Hamlin; 1864, 8 for Lincoln and Johnson; 1868, 8 for Grant and Colfax; 1872, 11 for Grant and Wilson; 1876, 11 for Hayes and Wheeler.

IOWA, a s.e. co. of Iowa, intersected by the Iowa and the n. branch of the English rivers; 576 sq.m.; pop. '75, 17,456. It is nearly level, well-wooded, and has a fertile soil, much of it prairie. The staple productions are wheat, oats, maize, potatoes, hay, and pork. It is traversed by the Chicago, Rock Island, and Pacific railroad. Bituminous coal is here found. Capital, Marengo.

IOWA, a co. in s.w. Wisconsin; 750 sq.m.; pop. '75, 24,133. It is bounded by Wisconsin on the north. The surface is varied by hills, valleys, and forests, the latter not extensive. The soil is fertile, yielding wheat, maize, oats, and hay. Mines of zinc and copper have been opened, and lead is abundant. A division of the Milwaukee and St. Paul railroad passes along the n. border, and Mineral Point railroad runs to the county seat, Dodgeville.

IOWA CITY, a city in Iowa, United States, formerly the capital of the territorial government, is situated on the Iowa river, 80 m. from its mouth. It is built on a succession of plateaux, rising from the river. The first is a public promenade; the third is crowned by the capitol, now the state university. It has also county buildings, and the state asylums, with factories on the river. Iowa City has steamboat navigation to the Mississippi, and is on the Chicago, Rock Island, and Pacific railroad. Pop. '70, 5,914.

IOWA CITY (*ant.*) is the capital of Johnson co., and was, 1839-57, the capital of Iowa territory and state; pop. '74, 9,000. It is 54 m. from Davenport, and 120 m. from Des Moines, and connected with these by the Chicago, Rock Island, and Pacific railroad. The city is built on a high plateau 150 ft. above the river, and surrounded by hills. The Iowa university, established 1860, and occupying the building formerly used as the capitol, has 4 departments, 600 students, a library of 6,500 volumes, and is open for both sexes. The city contains two national banks, a savings bank, 3 academies, a high school, 15 churches, a foundry, a paper-mill, manufactories for carriages, plows, pumps, cigars, linseed oil, and alcohol, and has also a number of flouring mills. There are also several newspapers, one of which is in the Bohemian language.

IOWA COLLEGE, at Grinnell, Poweshiek co., Iowa; organized in 1848, under the auspices of the Congregationalists. It comprises preparatory, academical, normal, medical, and law departments. Professors in 1878, 15; students, 120. President, Geo. F. Magoun, D.D.

IOWA RIVER, a river of Iowa rising in Hancock co. Flowing s.e. 300 m., it empties into the Mississippi. It is navigable for small vessels 80 m. to Iowa city.

IOWA STATE AGRICULTURAL COLLEGE, at Ames, Story co.; organized in 1869, with an endowment of 204,309 acres of land, appropriated by act of congress of July 2, 1862; annual income, \$41,000. The college farm contains 873 acres, of which 60 acres are included in the lawn and ornamental grounds. The main college building is four stories high above the basement, 150 ft long by 112 ft. deep through the wings. In the basement are dining-hall, kitchen, laundry, experimental kitchen and laundry, printing-office, and armory. The laboratory is of brick, two stories high, and 70 by 44 feet. Another brick building is devoted to botany and veterinary science, and behind it is the veterinary hospital and dissecting room. The library contains 6,000 volumes. The museum occupies a large room in the main building. It includes mounted specimens of a few mammals; several hundred birds (mounted), representing the avian fauna of the state; a large collection of reptiles, in alcohol; a few fishes; and a small but typical collection of invertebrates. A set of the "Ward models," illustrating the principal larger fossils, and a cabinet of mineralogical specimens, are of service in the study of geology. There are, besides, the following collections in the process of formation: A seed collection; an entomological cabinet; sets of the eggs and nests of birds; the brains of vertebrates; skulls of mammals; and skeletons of vertebrates. Each department is well supplied with apparatus. Women are admitted to all the courses of study. Number of professors in 1880, 13; other teachers, 9; students, 284; alumni, 165. All male students are required, unless excused by the proper authority, to wear the prescribed uniform, attend all military exercises in their respective classes, and become members of the college battalion. President, A. S. Welch.

IOWA STATE UNIVERSITY, in Iowa City, was organized in 1847, with an endowment by congress of two townships of land; to which was added in 1878, by the state, \$20,000 annually. Its annual income, from all sources, is \$51,000. The campus embraces an area of 10 acres, on which are placed the three principal college buildings. Besides these, there are, outside the campus but on land owned by the university, an observatory, hospital, and homeopathic medical college. There is a large laboratory for physical science, with a select apparatus of excellent quality; a laboratory for natural science, with a dozen good microscopes; a cabinet, not large, but select in the department of corals, and birds of Iowa. The library contains about 15,000 volumes. Number of professors in 1880, 22; lecturers and instructors, 18; students, 540; alumni, 1231. Women are admitted to all the courses of study. There is no gymnasium, but regular military drill and instruction. There is a law department, with two professors. The medical department embraces instruction in both the allopathic and homeopathic schools. President, J. L. Pickard, LL.D.

IOWAS, a tribe of American Indians of the Dakotah family, called Iowas by some of the Algonquins, but known among themselves by the name of Pahucha. In 1700 they lived on the Mankato river, Minnesota, numbering 1500, and often at war with the Osages and other tribes. At different times treaties have been made with them by the United States, by one of which, 1836, they were removed to the w. bank of the Missouri above Wolf river. They have been greatly reduced by intemperance, war, and disease. By a treaty, 1861, they ceded to the United States all but 16,000 acres. The remnant of this tribe, numbering now only 225, is under the charge of the Friends, who have a school of over 60 pupils and an orphans' industrial home.

IPECACUAN'HA, the name both of a very valuable medicine and of the plant producing it. The plant (*cephaelis ipecacuanha*) belongs to the natural order *cinchonaceæ*, and grows in damp shady woods in Brazil and some other parts of South America. It is somewhat shrubby, with a few oblongo-lanceolate leaves near the ends of the branches, long-stalked heads of small white flowers, and soft dark purple berries. The part of Ipecacuanha used in medicine is the root, which is simple or divided into a few branches, flexuous, about as thick as a goose-quill, and is composed of rings of various size, somewhat fleshy when fresh, and appearing as if closely strung on a central woody cord. The different kinds known in commerce (*gray*, *red*, *brown*) are all produced by the same plant; the differences arising from the age of the plant, the mode of drying, etc. Ipecacuanha root is prepared for the market by mere drying. It is collected at all seasons, although chiefly from Jan. to March; the plant is never cultivated, but is sought for in the forests chiefly by Indians, some of whom devote themselves for months at a time to this occupation. It has now become scarce in the neighborhood of towns.

Various other plants, containing emetine, are used as substitutes for true ipecacuanha. The ipecacuanha of Venezuela is produced by *sarcostemma glaucum*, of the order *asclepiadæ*; and to this order belongs *tylophora asthmatica*, the root of which is found a valuable substitute for ipecacuanha in India.

It is in the bark of the root that the active principle, the *emetine*, almost entirely lies, and in good specimens it amounts to 14 or 16 per cent; the other ingredients, such as fatty matters, starch, lignine, etc., being almost entirely inert. Emetine is represented by the formula $C_{37}H_{27}NO_{10}$. It is a white, inodorous, almost insipid powder, moderately soluble in alcohol, and having all the characters of the vegetable alkaloids. It acts as a

violent emetic in doses of one-sixteenth of a grain or less, and is a powerful poison. The ineptuous inhalation of the dust or powder of ipecacuanha—as in the process of, powdering it—will often bring on a kind of spasmodic asthma.

In small and repeated doses—as, for instance, of a grain or less—ipecacuanha increases the activity of the secreting organs, especially of the bronchial mucous membrane, and of the skin. In larger doses of from 1 to 5 grains it excites nausea and depression, while in doses of from 15 to 30 grains it acts as an emetic, without producing such violent action or so much nausea and depression as tartar emetic.

Ipecacuanha is useful as an emetic when it is necessary to unload the stomach in cases where there is great debility, or in childhood. As a nauseant, expectorant, and diaphoretic, it is prescribed in affections of the respiratory organs, as catarrh, hooping-cough, asthma, etc.; in affections of the alimentary canal, as indigestion, dysentery, etc.; and in disorders in which it is desired to increase the action of the skin, as in diabetic, febrile affections, etc.

Besides the powder, the most useful preparations are the wine of ipecacuanha—of which the dose to an adult as a diaphoretic and expectorant ranges from 10 to 40 minims, and as an emetic from 2 to 4 drachms—and the compound ipecacuanha powder, commonly known as *Dover's powder* (q.v.). To produce the full effect as a sudorific, a dose of ten grains of Dover's powder should be followed by copious draughts of white-wine whey, treacle-posset, or some other warm and harmless drink.

IPHICRATES, an Athenian general conspicuous in the first half of the 4th c. B.C. He is distinguished for his improvements in military tactics, especially for the light oval target instead of the round heavy buckler of earlier use. A common mode of warfare among the Greek states, who were often at war, was by sudden incursions into each other's territories, and rapid retreats. Iphicrates, seeing that safety required light armor, organized a body of soldiers carrying a light target, and from it called Peltastæ. Their discipline and efficiency were such that but few of the heavy-armed infantry dared to meet them. With these he attacked a Spartan corps near Corinth, 392 B.C., and totally destroyed it. This was followed by successive victories, and his military career was very brilliant. In the Hellespont and with the Persians in Egypt he served with high distinction. After the peace of Antalcidas he married the daughter of Cotys, king of Thrace, and formed an alliance with him against the Athenians for the possession of the Thracian Chersonesus. Subsequently the Athenians pardoned him, and gave him a joint command in the social war. Though accused by one of his colleagues of misconduct, he was honorably acquitted. He lived after this quietly in Athens, where he died at an advanced age.

IPHIGENIA, in Grecian legend, a daughter of Agamemnon and Clytemnestra, or, according to others, an adopted daughter of Clytemnestra. Her father, having offended Diana, vowed to make atonement by sacrificing to the goddess the most beautiful thing born within the year. This happened to be Iphigenia. Agamemnon long delayed the fulfilment of his vow, but at length the Trojan expedition drew on, and the Greek fleet being detained in Aulis by a calm, the seer Calchas declared that Agamemnon must keep his promise. When Iphigenia was brought to the altar, however, she disappeared, and a hind lay there in her stead, Diana herself having carried her off in a cloud to Tauris, where she became her priestess, but was afterwards recognized by her brother, Orestes, who carried her, along with the image of Diana, to Attica. The legend is of post-Homeric origin. It has, however, been much wrought into Grecian poetry, and afforded many subjects to painters and sculptors. In modern literature it has been again employed with great power of genius and poetic art by Goethe in his *Iphigenia auf Tauris*.

IPOMÆA, a genus of plants of the natural order *convolvulaceæ*, differing very little from the genus *convolvulus*. The species are numerous. They are mostly natives of warm countries. Some of them are often to be seen in flower-gardens and hot-houses, being very ornamental, and readily covering trellises with their twining stems, large leaves, and large beautiful flowers. The roots of some of them yield a resinous substance, which possesses properties resembling those of jalap, and the true jalap (q.v.) plant itself has sometimes been referred to this genus.

IPSAMBUL'. See ABOUSAMBUL.

IP'SICA. See MODICA.

IPSUS, a t. of Phrygia, Asia Minor, near, as is supposed, the modern village of Bulavadin, and noted for the battle, 300 B.C., in which Antigonus and his son Demetrius were overthrown by Alexander's four generals, Ptolemy, Seleucus, Cassander, and Lysimachus. Ipsus was the seat of a Christian bishop in the 7th and 8th centuries.

IPSWICH, a t. of Essex co., Mass., 27 m. n.e. of Boston, on the Ipswich river and the Eastern railroad; pop. '80, 3,699. It has 6 churches, a savings-bank, a girls' school of high character, established 1828; an insane asylum, a public library, a high school, a classical academy established 1650, factories for boots, shoes, and hosiery; also planing, saw, and grist mills. The Indian name is Agawam.

IPSWICH, a market t., parliamentary and municipal borough, and river-port of England, capital of the co. of Suffolk, is agreeably situated on the river Orwell, at the foot of a range of hills, 68 m. n.e. of London. The older portions of the town consist of narrow and irregular streets, some of the old houses of which are ornamented with curious carved work. It contains numerous churches and benevolent institutions, a town-hall, a mechanics' institution, with about 700 members; and a working-men's college, with 200 members. Of its educational establishments, the principal is the grammar-school, founded by cardinal Wolsey, and endowed by queen Elizabeth. It has an income from endowment of £116 6s. 8d., has six scholarships, exclusive of an Albert scholarship, founded as a memorial of the late prince consort, and two exhibitions at Pembroke college, Cambridge. There are large iron and soap factories, breweries, corn-mills, and ship-building docks. In 1875, 4,450 vessels, of 340,113 tons, entered and cleared the port. The exports are chiefly agricultural produce, and agricultural implements and machinery; imports, wine, coal, iron, and timber. The town can be approached by vessels of 500 tons. It sends two members to the imperial parliament. Pop. '71, 42,947. Ipswich was pillaged by the Danes in 991, and again in 1000.

IPSWICH, a t. of Queensland, Australia, on the Bremer; pop. '71, 5,092. It has a number of churches, a grammar-school and a hospital, and is a place of increasing business importance.

IRAK-A'JEMI, a large province of Persia, is bounded on the n. by the provinces of Azerbaijan, Ghilan, and Mazanderan, and on the e. by Khorasan. On the s. and w. the boundaries are not definitely laid down. In the extreme n. are the Elburz mountains, and throughout the province are several other chains, all of them running from s.e. to n.w. A great portion of the surface of the province consists of elevated table-lands, but there are also numerous fertile valleys traversed by rivers. Many of the rivers of Irak-Ajemi are swallowed up by sandy tracts into which they flow. The chief towns of the province are the capital Teheran and Ispahan.

IRAK-A'RAEI, a district in Turkey in Asia, the ancient Babylonia (q.v.), comprises the ruins of the ancient cities of Babylon, Seleucia, and Ctesiphon. During the last 250 years of the caliphate this was the poor remnant of their once wide dominion which remained to the successors of Mohammed.

IRAN, the modern native name of Persia. See ARYAN RACE.

IRANIC RACES AND LANGUAGES. See PERSIAN LANGUAGE AND LITERATURE, *ante*.

IRBIT, a district t. of the government of Perm, eastern Russia, since 1775; founded (1635) by Russian emigrants. The town is situated on the rivers Ibit and Nitza, in lat. 57° 35' n., and long. 62° 50' e., is 1760 m. distant from St. Petersburg, and contains (1867) 4,244 inhabitants. It is remarkable for its extensive fair, the largest in Russia, after that of Nijni-Novgorod. The fair takes place annually from Feb. 27 till the end of Mar., has been instituted for more than 200 years, and attracts about 10,000 merchants and visitors from Russia, Siberia, Persia, Bokhara, etc. The principal goods are cloths, silk stuffs, brocades, sugar, coffee, china, and hardware from Russia; tea and nankeen from China, through Kiachta; furs and fish from Siberia; cotton stuffs from Bokhara, etc. The whole quantity of goods brought to market is valued at £6,500,000.

IREDELL, a co. of w. North Carolina; 600 sq.m.; pop. '80, 22,672. It is drained by branches of the Gadkin, and is well-wooded, hilly, and fertile. The staple products are grain, cattle, wool, and tobacco. Gold is found. It is traversed by the Western railroad. Capital, Statesville.

IREDELL, JAMES, 1751-99; b. England, of Irish ancestry. He emigrated to North Carolina at the age of 17, was admitted to the bar in 1770, made deputy attorney-general in 1774, judge of the state supreme court in 1777. He was attorney-general of North Carolina, 1779-82; and judge of the United States supreme court from 1790 until his death. He was a man of ability and learning. In 1791 he published *Iredell's Revision of the Statutes of North Carolina*. His judicial opinion in the case of "Chisolm vs. Georgia" is said to contain the germs of the doctrine of state rights as subsequently developed. He died in Edenton.

IREDELL, JAMES, 1788-1853; son of James; b. N. C. He graduated at the college of New Jersey in 1806, and was admitted to the bar. For 10 years he was a member of the legislature, and twice speaker of the lower house. In the war of 1812 he commanded a company of volunteers at Norfolk, Va. In 1819 he was chosen judge of the superior court; in 1827 was governor of the state; and U. S. senator in 1828-31. For many years after this he was a reporter of the decisions of the state supreme court, and published 13 volumes of law and 8 of equity reports. In 1833 he was one of a commission to collect and revise the state statutes. He published also a treatise on the law of executors and administrators.

IRELAND, an island forming part of the United Kingdom of Great Britain and Ireland, lies between lat. 51° 26' and 55° 23' n., and long. 5° 20' and 10° 26' west. It is washed on the n., w., and s. by the Atlantic, and on the e. by a strait, called at different

places the North channel, the Irish sea, and St. George's channel, which separates it from the larger island of Great Britain. Its greatest length, from Fair head in Antrim to Crow head in Kerry, is 306 m., but its greatest meridional length is not more than 225; its greatest breadth, between the extreme points of Mayo and Down, is 182 m., but between Galway bay and Dublin it is not more than 120. The total area is about 32,524 sq m., of which 15,464,825 acres are arable land; 4,357,338 acres are uncultivated; 316,597 are covered with wood; 49,236 are occupied by towns of 2,000 inhabitants and upwards; while the lakes and waters of the country cover 627,464 acres. Pop. '71, 5,412,377. Ireland is divided into four provinces of Ulster, Leinster, Munster, and Connaught, which again are subdivided into 32 counties. The following table exhibits the area of the different provinces and counties, the number of inhabited houses, and the pop. in 1861 and 1871 (as at first published):

PROVINCES AND COUNTIES.	Area in Stat. Acres.	Inhabited Houses, 1871.	Population, 1871.	Population, 1861.
LEINSTER.				
Carlow	221,342	9,704	51,472	57,137

Physical Aspect.—Ireland is of oblong form, and, like Great Britain, the eastern coast is comparatively unbroken, while the w., n., and s. are deeply indented. It is an undulating or hilly country—less rugged than the Highlands of Scotland, and not so tame as the eastern section of England. Its hills are more rounded than abrupt, and lie not so much in ranges as in detached clusters round the coasts. These mountain tracts rarely extend more than 20 m. inland, and they seem to form a broad fringe round the island; while the interior appears as a basin composed of flat or gently swelling land. The principal ranges are the Mourne mountains in Down, which attain their highest elevation in Slieve Donard, 2,796 ft. above the sea; the mountains of Wicklow, which rise to a height of 3,039 ft.; and Macgillicuddy Reeks in Kerry, which, in the peak of Carran-Tual, the loftiest point in Ireland, reach 3,414 feet. The purely flat or level portions of the island, with the exception of some fine tracts of fertile valley-land in Kilkenny, Tipperary, and Limerick, consist mainly of *bog* or morass, which occupies, according to Dr. Kane, 2,830,000 acres, or about a seventh part of the entire super-

ficies. The largest of these morasses is the bog of Allen, which stretches in a vast plain across the center of the island, or over a large portion of Kildare, Carlow, King's and Queen's counties—having a summit elevation of 280 feet. Extensive tracts of deep wet bog also occur in Longford, Roscommon, and other counties, and give a peculiarly dreary and desolate aspect to the scenery. Notwithstanding the quantity of water in these bogs, they exhale no miasma injurious to health, owing to the large quantity of tannin which they contain.

Hydrography.—The principal river of Ireland, and the largest in the United Kingdom, is the Shannon (q.v.). The streams which drain the eastern part of the central plain are the Liffey and the Boyne; the south-eastern part, the Suir, the Barrow, and the Nore; while the waters of the north-eastern part are collected into Lough Neagh, chiefly by the Blackwater, and thence discharged into the sea by the lower Bann. The rivers external to the great central plain are necessarily short. The principal are the Erne, flowing to the n.w.; the Foyle and the Bann, to the n.; the Lagan, to the n.e.; the Slaney, to the s.e.; and the Bandon, Lee, and Blackwater, flowing in an easterly course through the co. of Cork, the most southern co. in the island. None of these rivers are naturally of importance to navigation. The Shannon, however, has been made navigable to its source by means of locks and lateral cuts; the Barrow, by similar means, to Athy; the Foyle, by canal to Strabane; and several of the others have been artificially united by such lines as the Lagan, Newry, Ulster, Royal, Grand, Athy, and other canals—which now intersect a considerable portion of the island.

The lakes of Ireland (called loughs) are, as might be expected from the surface-character of the country, both numerous and extensive in proportion to the size of the island. The largest is lough Neagh in Ulster, covering an area of 100,000 acres. The other loughs of consequence are loughs Erne and Derg, also in Ulster; Conn, Mask, and Corrib, in Connaught; the Allen, Ree, and Derg, which are expansions of the river Shannon, and the lakes of Killarney (q.v.) in Kerry.—The bays and salt-water loughs which indent the island are also numerous and of considerable importance. About 70 are suitable for the ordinary purposes of commerce; and there are 14 in which the largest men-of-war may ride in safety. The principal are loughs Foyle and Swilly, on the n. coast; the bays of Donegal, Sligo, Clew, and Galway, the estuary of the Shannon, Dingle bay, and Bantry bay, on the w.; the harbors of Cork and Waterford, on the s.; Wexford harbor, the bays of Dublin, Drogheda, and Dundalk, and loughs Carlingford, Strangford, and Belfast, on the east.—The islands are, generally speaking, small and of little importance. On the e. coast the largest is Lambay, about $2\frac{1}{2}$ m. off the coast of Dublin; on the s. and s.e. coasts are Clear island, the Saltees, a dangerous group of islets, about 8 m. s. of the Wexford coast, indicated by a floating light, and Tuscar rock, about 8 m. e. of Carnsore point, also a dangerous ledge, rising 20 ft. above the sea, and surmounted by a light-house after the model of the Eddystone; on the w. coast, the Skelligs, Valentia, the Blaskets, the South Arran isles, Innisbofin, Innisturk, and Clare, Achil or "Eagle" island, and the Inniskea islets; on the n. coast, the North Arran isles, the Tory isles, and Rathlin.

Geology.—A great series of grits and slates of Cambrian age occur in the s.e. of Ireland; the upper portion contains a few fossils of zoophytes and worms. Lower silurian strata rest unconformably on the Cambrian rocks in the same district. They consist of flags, slates, and grits many thousand feet in thickness, extending over large portions of Kildare, Wicklow, Wexford, and Waterford. Several detached patches occur to the w. of this district, forming the Keeper, Arra, and Inchiquin mountains. A tract of similar beds stretches from the center of Lieland, near the source of the Shannon, to the coast of Down. The strata in proximity to the Wicklow and Dublin granites are converted into gneiss and mica-slate. This is the condition of all the beds in the n.w., in Donegal, Tyrone, and Mayo; they appear to be a continuation of the highly altered strata of the n. of Scotland. Detached portions of upper silurian measures occur on the western side of the island, in Kerry, Galway, and Mayo.

Between the silurian and old red sandstone is an enormous thickness (11,000 ft.) of sandstone grit and shale in Kerry and Cork. These strata are almost wholly unfossiliferous.

Old red sandstone strata, consisting of red and yellow sandstone and slate, cover a large tract of the s. of Ireland, stretching almost continuously from the extreme w. of Cork and Kerry into Waterford and Kilkenny, being stopped by the silurian rocks of Wexford and Carlow. Along the bases of the silurian mountains of the s. center of Ireland, and in the southern portion of the county of Cork, occurs a great thickness of sandstones, which have hitherto yielded no fossils; some geologists refer these to the old red series, others hold them to be lower carboniferous.

The *carboniferous limestone* is extensively developed in Ireland, occupying the whole of the center of the country, except in those places already alluded to, where the older rocks appear on the surface. This great tract is an extensive plain covered with drift, and with peat-moss and fresh-water marl, in which are found the remains of *megaceros hibernicus* and *bos longifrons*. In Kerry, Cork, and Waterford the strata are very much contorted, the coal-seams are changed into anthracite, and so squeezed and crushed as to be got only in small dice-like fragments. Further n. the strata are nearly horizontal.

but the coal-fields are limited, and the seams are generally of inconsiderable thickness. They occur chiefly in Tipperary, Kilkenny, Tyrone, and Antrim.

Small deposits of *Permian strata* are found at Ardtrea in Tyrone, and at Cultra near Belfast; the sandstones of Roan hill near Dungannon are probably of the same age. The red and variegated marls containing beds of gypsum and rock-salt, which exist on the coast n. from Belfast, are probably *triassic*. Resting on these marls are a few thin beds of *lias*. *Cretaceous strata* occur in Antrim and Derry.

Climate.—Though the climate of Ireland bears, as might have been expected, a strong resemblance to that of Great Britain (q.v.), it has yet a character peculiar to itself, owing to the marked difference in the configuration of its surface, its greater distance from the continent of Europe, and its being, as it were, more completely bathed in the warm waters of the gulf-stream. The mean annual temperature of the central parts of the country is about $50^{\circ}.0$, rising in the s. to $51^{\circ}.5$, and falling in the n. to $48^{\circ}.5$. There are thus $3^{\circ}.0$ of difference between the extreme n. and s., and it may be noted that, speaking generally, this difference is constant through all the seasons of the year. The mean temperature in winter is $41^{\circ}.5$; in spring, $47^{\circ}.0$; in summer, $60^{\circ}.0$; and in autumn, $51^{\circ}.0$.

The annual rainfall averages from 25 to 28 in., except in the neighborhood of hills, where the precipitation is considerably augmented; thus, at Valentia, in Kerry, the rainfall of 1861 amounted to 73 in., and doubtless this large fall was greatly exceeded in those parts which are situated among the higher hills. The rainfall in winter, particularly in the w., is greatly in excess of the other seasons, owing to the low temperature of the surface of the ground during winter, which suddenly chills the warm and moist s.w. winds that prevail, especially at this time of the year, and condenses their vapor into rain. Since in Great Britain the chief mountain ranges are in the w., it follows that over the whole eastern slope of the island the climate is dryer, the amount and frequency of the rainfall much less, and the sunshine more brilliant than in the west. In Ireland, on the other hand, the hills in the w. do not oppose such a continuous barrier to the onward progress of the s.w. winds, but are more broken up and distributed in isolated groups. It follows that the sky is more clouded, and rain falls more frequently in Ireland, and the climate is thus rendered more genial and fostering to vegetation; hence the appropriateness of the name "Emerald Isle." Again, owing to its greater distance from the continent, the parching and noxious e. winds of spring are less severely felt in Ireland, because the n.e. winds have acquired more warmth and moisture in their progress. It is on this account that the most salubrious spring climates possessed by England, Scotland, and Ireland are situated in the s.w. of their respective countries. Thus, Queenstown, in the s.w. of Ireland, enjoys an average spring temperature as high as $50^{\circ}.0$, which is about the highest in the British islands, and nearly $3^{\circ}.0$ higher than the e. of Kent, which is nearly in the same latitude.

Since wheat ripens in these latitudes with a mean summer temperature of $56^{\circ}.0$, it follows that the climate of Ireland is quite sufficient for the successful cultivation of the finer sorts of grain, which are subjected to much less risk in backward seasons than is the case in north Britain, where the summer temperature is only a degree and a half from the extreme limit of wheat-cultivation. Also, considering its remarkably open winters, which lengthen out the period of grazing, its mild and genial climate through all the seasons, and its comparative freedom from droughts, it will be seen that its climate is equally well adapted for the rearing of cattle. These considerations, combined with the fertility of the soil, open up for Ireland, as far as the physical conditions are concerned, a prospect of great national prosperity, based on most remarkable, though as yet only partially developed agricultural resources.

Soil and Vegetation.—Until the middle of last century Ireland was almost exclusively a pasturing country, and in 1727 an attempt was made (unsuccessfully, however) to pass an act compelling land-holders to "till five acres out of every hundred in their possession, and to release tenants to the same extent from the penal covenants in their leases against tillage." The result of this state of things is the wretchedly poor system of agriculture, from which Ireland still suffers largely. The natural fertility of the country is nevertheless great.

The extent under each of the principal crops in 1871, 1873, and 1875 is given in the following table:

Crops.	Extent cultivated in		
	1871. Acres.	1873. Acres.	1875. Acres.
Wheat	244,451	168,435	161,321
Oats.....	1,636,136	1,510,089	1,499,371
Barley, bere, and rye.....	239,534	239,428	244,059
Beans and pease.....	10,913	12,872	11,647
Potatoes.....	1,058,434	903,282	900,277
Turnips.....	327,035	347,904	332,783
Other green crops.....	126,220	121,234	137,026
Flax.....	156,670	129,432	101,248
Meadow and clover.....	1,829,044	1,837,483	1,943,923

The estimated produce in 1871 and 1876 was as under:

Crops.	Produce. 1871.	Produce. 1876.
Wheat.....	705,939	481,815 qrs.
Oats.....	7,410,814	7,648,774 "
Barley, bere, and rye.....	965,709	1,109,981 "
Beans and pease.....	49,690	48,131 "
Potatoes.....	2,793,641	4,154,785 tons.
Turnips.....	4,246,332	4,440,818 "
Mangel and cabbage.....	761,863	1,039,023 "
Flax.....	12,919	27,141 "
Meadow and clover.....	3,315,525	3,458,239 "

Live-stock.—According to the census of 1851, the estimated value of the live-stock was £27,737,393; for 1861, £33,434,385; and for 1871, £37,515,211. In 1875 the estimated value was £52,343,697.

Fisheries.—In her fisheries, Ireland is supposed to possess an almost inexhaustible mine of wealth, but, strange to say, they are much neglected. The surrounding seas abound with cod, ling, hake, herrings, pilchards, etc., and yet the Irish markets are extensively supplied with cured fish from Scotland and the Isle of Man. The number of vessels and boats engaged in the sea-fisheries in 1846 was 20,000, employing 100,000 men and boys; but in 1876 it had decreased to 5,965, employing only 23,693 persons. The *salmon fisheries* are improving annually, and in 1877 employed 11,582 men. Their estimated value is over £400,000 a year.

Manufactures.—According to McCulloch, "Ireland is not, and never has been, a manufacturing country. Its unsettled turbulent state, and the general dependence of the population on land, have hitherto formed insuperable obstacles to the formation of great manufacturing establishments in most parts of the country; whilst the want of coal, capital, and skillful workmen, and the great ascendancy of England and Scotland in all departments of manufacture, will, there is reason to think, hinder Ireland from ever attaining eminence in this department." Linen is the staple manufacture, of which Belfast and the surrounding districts of Ulster are the chief seats. The export of linen manufactures from Ireland to Great Britain was, in 1864, £10,327,000. The manufacture of woolen stuffs is limited to a few localities, as Dublin, Cork, Waterford, Queen's co., and Kilkenny. Silk and cotton manufactures are also carried on, but only to a comparatively inconsiderable extent. In 1875 the number of factories (cotton, woolen, worsted, flax, jute, and silk) in Ireland amounted to 235, employing 1,087,968 spindles, 21,056 power-looms, and 67,744 persons of both sexes; of these, 149 were flax factories, employing 925,562 spindles, 17,827 power-looms, and 60,316 persons. A great source of employment for females has of late years sprung up in the n. of Ireland, in the working of patterns on muslin with the needle. Belfast is the center of this manufacture, which employs about 300,000 persons, chiefly females, scattered through all the counties of Ulster; and some localities of the other provinces. About 40 firms are engaged in the trade, and the gross value of the manufactured goods amounts to about £1,400,000. Silk manufactures, since their introduction by French emigrants in the beginning of the last century, have been almost entirely confined to Dublin; but poplin is now extensively manufactured there, and in a few other towns.

Commerce and Shipping.—The exportation of the agricultural produce of the country has always been the chief commercial business carried on in Ireland. By far the greater part of this trade is carried on with Great Britain. It cannot, however, be traced later than 1825, when the commercial intercourse between Great Britain and Ireland was assimilated by law to the coasting-traffic carried on between the different ports of England, except in the single article of grain.

The number of sailing and steam vessels, with their tonnage, registered in the ports of Ireland, in 1871, was 1776 vessels, tonnage 218,162; in 1875, 1703 vessels, tonnage 218,343.

Government.—The government of Ireland, since the union in 1801, is identical with that of Great Britain. It is represented in the imperial parliament by 28 members of the house of lords, and 103 of the house of commons. The executive government is invested in a lord-lieutenant, assisted by a privy council and chief secretary; and the law is administered by a lord chancellor, a master of the rolls, and twelve judges of the supreme court of judicature, which has two divisions—the high court of justice, with several subdivisions, and the court of appeal. County and municipal matters are conducted nearly as in England, with the exception of an armed national constabulary or police force of about 12,000 men, with 348 horses.

Religion.—A vast majority of the inhabitants of Ireland are Roman Catholics; but the Episcopal church, a branch of the Church of England, was the established church till Jan., 1871. It now exists independently as the Church of Ireland. In 1871 the number of Roman Catholics was 4,150,877; of Protestants, 1,260,568; and of Jews, 258.

Education.—Ireland possesses several universities: Dublin university (q.v.) was founded by queen Elizabeth in 1591; the queen's colleges of Belfast, Cork, and Galway, opened in 1849, are united in one university. The Roman Catholic university was

founded in 1854; and Maynooth college (q.v.) in 1795, for the education of Roman Catholic priests. There are also several Irish colleges and medical schools in connection with the London university. The primary schools of Ireland are mostly under the management of the "commissioners of national education." This system, established in 1833, proceeds on the principle that "the schools shall be open alike to Christians of every denomination; that no pupil shall be required to attend any religious exercise, or receive any religious instruction which his parents may not approve; and that sufficient opportunity shall be afforded to pupils of each religious persuasion to receive separately such religious instruction as their parents or guardians may think fit." The following table exhibits the progress of the system:

Years.	No. of Schools.	No. of Pupils.	Parliamentary Grants.
1834.....	1,106	145,521	£20,000
1840.....	1,978	232,560	50,000
1850.....	4,547	511,239	125,000
1860.....	5,632	804,000	270,722
1870.....	6,806	998,999	394,209
1871.....	6,914	1,021,700	408,388

In 1875 there were 7,267 national schools, with a total of 1,011,799 pupils; of whom 798,024 were Roman Catholic; 111,133 Presbyterian; and 89,907 Episcopalian children. The parliamentary grant in the same year was £639,368. Besides the national schools, the "church education society" had, in 1870, 52,166 scholars, of whom 44,662 belonged to the established church.

History.—According to ancient native legends, Ireland was in remote times peopled by tribes styled Firbolgs and Danauns, eventually subdued by Milesians or Gaels, who acquired supremacy in the island. The primitive inhabitants of Ireland are now believed to have been of the same Indo-European race with the original population of Britain. Although Ireland, styled *Iernis*, is mentioned in a Greek poem five centuries before Christ, and by the names of *Hibernia* and *Juverna* in various foreign pagan writers, little is known with certainty of her inhabitants before the 4th c. after Christ, when, under the appellation of *Sroti*, or inhabitants of *Scotia*, they became formidable by their descents upon the Roman province of Britain. These expeditions were continued and extended to the coasts of Gaul till the time of Laogaire MacNeill, monarch of Ireland (430 A.D.), in whose reign St. Patrick (q.v.) attempted the conversion of the natives. Although Christianity had been previously introduced in some parts of the island, Patrick encountered great obstacles, and the new faith was not fully established in Ireland till about a century after his decease.

From the earliest period each province of Ireland appears to have had its own king, subject to the *ard-righ* or monarch, to whom the central district called Meath was allotted, and who usually resided at Tara. Each clan was governed by a chief selected from its most important family, and who was required to be of mature age, capable of taking the field efficiently when occasion required. The laws were peculiar in their nature, dispensed by professional jurists styled *brehons*, who, as well as the poets and men of learning, received high consideration, and were endowed with lands and important privileges. Cromlechs, or stone tombs and structures, composed of large uncemented stones, ascribed to the pagan Irish, still exist in various parts of Ireland. Lacustrine habitations, or stockaded islands, styled *crannógs* or *crannoges* (q.v.), in inland lakes, also appear to have been in use there from early ages. Of articles of metal, stone, clay, and other materials in use among the ancient Irish, a large collection has been formed in the museum of the royal Irish academy at Dublin. It is remarkable that a greater number and variety of antique golden articles of remote age have been found in Ireland than in any other part of northern Europe; and the majority of the gold antiquities illustrative of British history, now preserved in the British museum, are Irish.

In the 6th c. extensive monasteries were founded in Ireland, in which religion and learning were zealously cultivated. From these establishments numerous missionaries issued during the succeeding centuries, carrying the doctrines of Christianity under great difficulties into the still pagan countries of Europe, whose inhabitants they surprised and impressed by their self-devotion and ascetism. Many students of distinction from England and the continent frequented Ireland, and received gratuitous instruction at this period. To these ages has been ascribed the origin of the peculiar style of ornamentation, specimens of which are still extant in Irish manuscripts, and which was long erroneously assigned to the Anglo-Saxons, who now appear to have been indebted to the Irish mainly for Christianity, and entirely for letters. Among the eminent native Irish of these times were Columba (q.v.), or Colum Cille, founder of the celebrated monastery of Iona; Comgall, who established the convent of Bangor, in the county of Down; Ciaran of Clonmacnoise; and Adamnan, abbot of Iona, and biographer of Columba. Of the Irish missionaries to the continent, the more distinguished were Columbanus (q.v.), founder of Bobio; Gallus of St. Gall, in Switzerland; Dichuill, patronized by Clotaire; and Ferghal, or Virgilius, the evangelizer of Carinthia. The progress of Irish civilization was checked by the incursion of the Scandinavians, commencing towards the close of the 8th c., and continued for upwards of 300 years.

Establishing themselves in towns on the eastern coast of Ireland, with the assistance of friendly native tribes, they continued to make predatory expeditions into the interior until their signal overthrow at the battle of Clontarf, near Dublin (1014 A.D.), by Brian, surnamed Borumha, monarch of Ireland. From the close of the 8th to the 12th c., Ireland, although harassed by the Scandinavians, produced many writers of merit, among whom were Ængus, the hagiographer; Cormac MacCullenan, king of Munster, and bishop of Cashel, the reputed author of *Cormac's Glossary*; Cuan O'Lochain; Gilla Moduda; Flan of Monasterboice; and Tighernach, the annalist. The Irish scholars who during these times acquired highest eminence on the continent were Joannes Erigena, the favorite of Charles the bald of France; Dungal, one of the astronomers consulted by Charlemagne; Dichuill, the geographer; Donogh, or Donatus, bishop of Fiesole; and Marianus Scotus. Of the state of the arts in Ireland during the same period, elaborate specimens survive in the shrine of St. Patrick's bell, the cross of Cong, in Mayo (12th c.); the Limerick and Cashel croziers, and the Tara brooch, all displaying minute skill and peculiar style. To much earlier times is assigned the *Book of Kells* (see KELLS), a Latin copy of the four gospels, in the library of Trinity college, Dublin, which Mr. Westwood has pronounced to be the most elaborately executed manuscript of early art now in existence, and of portions of which fac-similes are given in his work *Palaographia Sacra Pictoria*. Of the Irish architecture of the period examples survive at Cashel. The well known round towers of Ireland are believed to have been erected about this era as belfries, and to serve as places of security for ecclesiastics during disturbances. The skill of the Irish musicians in the 12th c. is attested by the enthusiastic encomiums bestowed by Giraldus Cambrensis upon their performances. The Scandinavians have left behind them in Ireland no traces of civilization except coins struck at Dublin, Waterford, and Limerick, in which towns they were, for the most part, subject and tributary to the natives.

The first step towards an Anglo-Norman descent upon Ireland was made by Henry II., who obtained in 1155 a bull from pope Adrian IV., authorizing him to take possession of the island, on condition of paying to the papal treasury a stipulated annual revenue. Political circumstances prevented Henry from entering upon the undertaking till 1166, when Dermod MacMurragh, the deposed king of Leinster, repaired to him, and obtained authority to enlist such of his subjects as might be induced to aid him in attempting to regain his forfeited lands. Dermod, returning to Ireland in 1169, with the aid of his foreign mercenaries, and still more numerous Irish allies, succeeded in recovering part of his former territories, and in capturing Dublin and other towns on the eastern coast. After his death in 1171 the succession to the kingdom of Leinster was claimed by his son-in-law, Richard FitzGisbert, earl of Pembroke, surnamed "Strongbow." In the following year king Henry, with a formidable armament, visited Ireland, received homage from several of the minor native chiefs, and from the chief adventurers, granting to the latter charters authorizing them, as his subjects, to take possession of the entire island, in virtue of the grant made to him by the pope. The chief Anglo-Norman adventurers, FitzGisbert, Le Gros, De Cogan, De Lacy, and De Curci, encountered formidable opposition before they succeeded in establishing themselves on the lands which they thus claimed. The government was committed to a viceroy, and the Norman legal system was introduced into such parts of the island as were reduced to obedience to England. The youthful prince John was sent by king Henry into Ireland in 1184; but the injudicious conduct of his council having excited disturbances, he was soon recalled to England. John, when king, made an expedition into Ireland in 1210, to curb the refractory spirit of his barons, who had become formidable through their alliances with the natives. During the 13th c. the principal Anglo-Norman adventurers succeeded in establishing themselves, with the feudal institutions of their nation, in some parts of Ireland, by the assistance or suppression of native clans. The Fitzgeralds, or Geraldines, acquired almost unbounded power in Kildare, and east Munster, or Desmond; the Le Botillers, or Butlers, in Ormond or west Munster; and the De Burghs, or Burkes, in Connaught. After the battle of Bannockburn, the native Irish of the north invited over Edward Bruce, and attempted to overthrow the English power in Ireland. The court of Rome, at the instigation of England, excommunicated Bruce with his Irish allies; but although his enterprise failed of success, the general result was a comparative collapse of the English dominion in Ireland. The descendants of the most powerful settlers gradually became identified with the natives, whose language, habits, and laws they adopted to so great an extent, that the Anglo-Irish parliament passed, in 1367, the "statute of Kilkenny," decreeing excommunication and heavy penalties against all those who followed the customs of, or allied themselves with, the native Irish. This statute, however, remained inoperative; and although Richard II., later in the 14th c., made expeditions into Ireland with large forces, he failed to effect any practical result; and the power and influence of the natives increased so much that the authority of the English crown became limited to a few towns on the coast, and the district termed "the Pale," comprising a small circuit about Dublin and Drogheda.

In 1534 Thomas Fitzgerald, son of the viceroy of Henry VIII., revolted, but not meeting with adequate support from his Anglo-Irish connections, he was, after a short time, suppressed and executed. Henry received the title of "king of Ireland" in 1541,

by an act passed by the Anglo-Irish parliament in Dublin; and about the same period, some of the native princes were induced to acknowledge him as their sovereign, and to accept peerages. The doctrines of the reformation met little favor either with the descendants of the old English settlers or with the native Irish. About the middle of the 16th c. Shane O'Neill, a prince of the most powerful ancient family of Ulster, attempted to suppress his rivals, and to assume the kingship of that province, in which he was eventually unsuccessful; but after his death in 1567 his successor received the title of earl of Tyrone from Elizabeth. The attempts of the English government in Ireland to introduce the reformed faith and English institutions stirred up great dissensions in Ireland. Among the first to revolt was the earl of Desmond, after whose death, in 1583, his vast estates in Munster were parcelled out to English settlers. Soon after, the chief clans of Ulster took up arms; and in opposing them the forces of Elizabeth, commanded by officers of high military reputation, encountered many reverses, the most serious of which was that in 1598 at the battle of the Yellow Ford, near Armagh, where the English army was routed and its general slain. Philip III. of Spain, at the solicitation of the Irish chiefs, dispatched a body of troops to their assistance in 1601, which, landing in the extreme south, instead of in the north, as had been expected, were unable to effect anything, and were constrained to surrender. Although Elizabeth was supported by numbers of native Irish, the northern chiefs, O'Neill and O'Donnell, held out till the queen's government came to terms with them in 1603, recognizing them as earls of Tyrone and Tirconnell. In 1608 these noblemen, having apprehensions for their personal safety, quitted Ireland unexpectedly, and retired to the continent. Their withdrawal enabled James I. to carry out that project of parcelling out the n. of Ireland to Scottish and English settlers which is usually known as the "plantation of Ulster." The Irish took advantage of the contentions in England to rise in insurrection (1641) and massacre the Protestants. It is believed that nearly 40,000 fell victims to their fury. The country continued in a state of anarchy till 1649, when Cromwell overran it. At the revolution the native Irish generally took the part of James II., the English and Scotch "colonists" of William and Mary, and the war was kept up for four years (1688-92). From this time till 1778 history records little beyond the passing of penal statutes against the Roman Catholics. In 1778 parliament relaxed the stringent pressure of these acts; but the widely spread disaffection which they caused gave birth to numerous societies, resulting in the rebellion of 1798, which was not suppressed till 1800. On Jan. 1 of the following year the legislative union of Great Britain with Ireland was consummated, and from this period the history of the country merges in that of Great Britain.

IRELAND, ARMS OF. The insignia of Ireland have been variously given by early writers. In the reign of Edward IV., a commission appointed to inquire what were the arms of Ireland found them to be three crowns in pale. It has been supposed that these crowns were abandoned at the reformation, from an idea that they might denote the feudal sovereignty of the pope, whose vassal the king of England was, as lord of Ireland. However, in a MS. in the heralds' college of the time of Henry VII., the arms of Ireland are blazoned azure, a harp or, stringed argent; and when they were for the first time placed on the royal shield on the accession of James I. they were thus delineated: the crest is on a wreath or and azure, a tower (sometimes triple-towered) or, from the port, a hart springing argent. Another crest is a harp or. The national flag of Ireland exhibits the harp in a field vert. The royal badge of Ireland, as settled by sign-manual in 1801, is a harp or, stringed argent, and a trefoil vert, both ensigned with the imperial crown.

IRELAND, CHURCH OF, the Irish branch of the Episcopal church of England and Ireland, established by law in Ireland, according to the act of union passed Jan. 1, 1801. The established church of Ireland, considering itself the rightful successor of the mediæval Roman Catholic church, took possession of the dioceses, parishes, and church property, and for a long time retained the divisions then existing. The Roman Catholics, constituting a large majority (77 per cent) of the population, have always regarded as unjust the existence, in their country, of an established Protestant church in connection with that of England. Notwithstanding its small membership the church had, in 1833, 4 archbishoprics, 18 bishoprics, the income from which was estimated at from £130,000 to £185,000. In that year the first inroad was made upon the prerogatives of the established church in the reduction of the archbishoprics to two and the bishoprics to ten. In 1868, on motion of Mr. Gladstone, the English house of commons voted to disestablish the church of Ireland. The house of lords rejected the proposition. But so strong was the expression of public opinion against the continuance of the privileges of the Irish church that the royal commissioners on the revenues and condition of the church of Ireland, recommended in their report, July 27, 1868, important reductions as to its benefices. They suggested, among other changes, the abolition of four bishoprics and one archbishopric, and that all benefices with less than 40 Protestants should be suppressed. At the close of the year 1868 Mr. Gladstone became prime minister and introduced, in Mar., 1869, a new bill for the disestablishment and disendowment of the Irish church, which, after a long and earnest debate, passed both houses of parliament, and on July 26 received the royal assent. The bill, containing 60 clauses, is entitled,

"A bill to put an end to the establishment of the church of Ireland, and to make provision in respect to the temporalities thereof, and in respect to the royal college of Maynooth." The disestablishment was to be total and to take place Jan. 1, 1871, when the ecclesiastical courts and laws were to cease, the bishops to be no longer peers in parliament, the ecclesiastical commission terminate, and a new commission of church temporalities, composed of ten men, appointed, in which the whole property of the Irish church should be vested. Public endowments, including state grants or revenues (estimated at £15,500,000), were to be retained by the state, and private endowments, such as money given from private sources since 1660 (valued at £500,000), were to remain with the disestablished church. The vested interests connected with Maynooth college, with the Presbyterians who were receiving the *regium donum*, and the incumbents, were to be secured. The aggregate of the payments would amount to about £8,000,000, leaving £7,500,000 at the disposal of parliament, and which should be appropriated "mainly to the relief of unavoidable calamity and suffering." A general convention held in Dublin, 1870, adopted a constitution for the disestablished church, according to which the church is to be governed by a general synod, composed of a house of bishops and a house of clerical and lay delegates, meeting annually in Dublin. The house of bishops has the right of veto, but seven members must agree upon it to render it valid. The bishops are chosen by the diocesan convention, but if the convention fail to elect a candidate to a vacant see by a majority of two-thirds of each order, the election falls to the house of bishops. The primate or archbishop of Armagh is elected by the house of bishops from their own order. The property of the church is vested in a permanent representative body, composed of three classes—the *ex-officio* archbishop and bishops, one clerical and two lay representatives for each diocese, and the co-opted members chosen by the *ex-officio* and representative members, and equal in number to the dioceses. One-third of the elected members retire by rotation. The first convention adopted resolutions against the ritualistic practices introduced into the church of England. In 1873 the number of benefices was 1548, of curates 622. The population connected with the church of Ireland, by the census of 1861, was 693,357 or 11.9 per cent of the whole population; in 1871, 683,295 or 10 per cent. As soon as the Irish act passed the temporalities commission took charge of all the property which had belonged to the established church, and sent out forms to be filled up by clergymen and others who had claims for a continuance of income. The whole number who had commuted at the end of 1873 was 6,162. The amount paid for claims up to Feb., 1873, was £8,259,673.

IRELAND, NEW. See NEW IRELAND.

IRELAND, WILLIAM HENRY, 1777–1835; b. London, son of Samuel, an English engraver and author; was educated in France, and apprenticed to a conveyancer. Visiting with his father, 1795, Stratford-upon-Avon, he forged a lease or deed pretending it to be the autograph of the poet, which he said he had found among some old law papers. He perpetrated other forgeries, and produced the plays of *Vortigem* and *Henry the Second* as the plays of Shakespeare, which deceived many literary men. *Vortigem* was acted at Drury Lane theater, and both were published, 1799. He confessed the forgeries, abandoned his profession, and spent the remainder of his life in more reputable pursuits. He wrote several novels, plays, poems, etc. His *Confessions*, 1805, contain an account of all his forgeries.

IRELAND ISLAND, one of the Bermudas (q.v.).

IRELAND—LAND LEAGUE. The year 1879 was memorable in the history of Ireland for having witnessed the beginning of a condition of public distress which eventually assumed the proportions of a famine, and for having seen, based upon this condition, the first movements of the popular disturbances of the following year. The poor harvests of 1879 having rendered it impracticable for the tenantry of Ireland to fulfill their rigorous rental obligations, demands were made upon the landlords for reduction of rent, and public meetings to this end were held in various parts of the country, besides an immense gathering in Hyde park, London, the largest ever held in that place, which was attended by more than 100,000 persons. In Oct. the National Irish Land League was organized by Charles Stewart Parnell, a prominent agitator, who was made its first president. This organization was established to procure a reduction of rents through constant agitation in the first instance; to emphasize and enforce a general refusal to pay rent, if this demand were not complied with; and, finally, to bring about a radical change in the existing system of English land-laws, by which the relation of landlord and tenant should be abolished and in its place established a class of peasant proprietors. The various speakers who devoted themselves to advocating the new scheme were violent and even seditious in their utterances, and three of these—James Bryce Killen, Michael Davitt, and James Daly, proprietor of the Mayo *Telegraph*—were arrested on a charge of having used seditious language at a public meeting held Nov. 2, 1879, at Gurteen, co. Sligo. Meanwhile the distress in the country increased, and during the winter and spring of 1879–80 a condition of famine spread throughout the western part of Ireland, where the most appalling scenes were every day occurrences. Organized efforts for relief were made in England under the direction of the Duchess of Marlborough; and in the United States heavy subscriptions were col-

lected, and large sums of money expended in breadstuffs and provisions, which were sent to the starving Irish. In the height of the generous excitement Mr. Parnell visited America, and traveled over the country, speaking in the principal cities and towns in the interest of the Land League. This movement aroused considerable opposition and ill-feeling, which was emphasized by the course of the New York *Herald*, whose proprietor, after causing his journal to oppose the political enterprise of Mr. Parnell, started a subscription for the suffering Irish, heading the list with the sum of \$100,000. Subscriptions poured in to the "*Herald*" fund with extraordinary liberality, and in a few weeks the amount subscribed reached the sum of half a million dollars, which was placed in the hands of a committee of gentlemen in England and Ireland, and by them distributed. The visit of the U. S. frigate *Constellation* to Ireland, loaded with grain and provisions, the gift of American citizens, was also an incident of this exciting period. The suffering in Ireland was greatly reduced by this timely aid, but the incendiary speeches of the Land Leaguers continued to excite public feeling, and agrarian outbreaks began to occur in different parts of the country. The assassination of the earl of Mayo and other landlords by their exasperated tenants added fuel to the flames, and by the close of the year (1880) it was generally conceded that no landlord's life was safe, if he remained on his estates in Ireland, unless he acceded to the demands of his tenants. But by this time these had grown bolder—mainly through the instigation of the Land League—and whereas before they had been satisfied with a reduction of rent, they now clamored for proprietorship. So serious had the situation become, and so much were English statesmen and politicians impressed with the necessity for radical action, that plans for buying up the English proprietorship in Ireland and distributing it among the native farm-tenants were seriously recommended to parliament, and taken into consideration by some of the leading minds in England. The British government, alarmed at the state of affairs, dispatched troops to the disturbed districts, and announced the policy of first restoring law and order before entering on measures of relief.

IRENÆUS, one of the most important of the ante-Nicene Christian writers, was an Asiatic by birth, but is known in history solely through his connection with the Greco-Gaulish church of southern France, of which he was a bishop. He was a scholar of Polycarp, through whom he may be regarded as having sat at the feet of St. John the apostle and evangelist. Irenæus was a priest of the church of Lyons under the bishop Pothinus, upon whose martyrdom, in the persecution of Marcus Aurelius in 177, he was himself elected to the same see, which he continued to govern for twenty five years. Irenæus is commonly believed to have suffered martyrdom at Lyons in the persecution under Septimius Severus in 202. His principal, indeed almost his only perfect, work is that which is commonly cited as *Adversus Hæreses* (Against Heresies). It is directed against the Gnosticism of his own age, and is most valuable as a picture of the doctrinal and moral condition of that age. Most of his other works also were doctrinal, but they are known only by description or by fragments. The earliest edition of the works of this father is that of Erasmus (Basel, 1526). They have been several times re-edited, the most prized edition being that of the Benedictine, Dom Massuet (Paris, 1710, and Venice, 1734).

IRENE, a celebrated Byzantine empress, was b. in Athens about 752 A.D. Her beauty and talent excited the admiration of the emperor Leo IV., who married her, 769 A.D. She is believed to have poisoned her husband, 780 A.D., after which event she became regent during the minority of her son, Constantine VI., then only nine years of age. A great worshiper of images—in fact, this species of idolatry had during the lifetime of her husband caused her to be banished from the imperial palace—she quickly began to plot for their restoration, and with this purpose assembled a council of bishops at Constantinople, 786 A.D., which, however, was broken up by the troops of the capital. A second council held at Nice in the following year was more successful, and image-worship was re-established in the eastern church. In 788 A.D. her army was defeated in Calabria by Charlemagne, who threatened the Byzantine empire. In 790 A.D. Constantine succeeded in taking the government out of her hands; but seven years after she caused him to be deprived of his eyes, and shut up in a dungeon, where he soon died. Still she was not free from anxieties. Her two favorites, Stauracius and Ætius, were constantly embroiled with each other, and their jealousies only ceased with the death of the former, 800 A.D. She now tried to secure her possession of the throne by a marriage with Charlemagne, but the Frank emperor had apparently no relish for a woman who had committed so many crimes, and the scheme proved abortive. Two years later her treasurer, Nicephorus, rebelled against her, and suddenly seizing her person, banished her to the isle of Lesbos, where she was forced to spin for a livelihood. Here she died of grief, 803 A.D. Irene was a wise, able, and energetic ruler; but her crimes were so great and unnatural that history can speak of her character as a whole only in the language of reprobation. The Greek church, however, on account of her zeal for image-worship, has placed her among its saints.

IRETON, HENRY, an English general of the period of the Commonwealth, was the eldest son of German Ireton, of Attenton, in Nottinghamshire, and was b. in 1610. He studied law at Oxford, but on the breaking out of the civil war offered his services to the parliament. His connection with Cromwell, whose daughter, Bridget, he married

in 1646, greatly advanced his interests. At Naseby he was taken prisoner by Rupert, but rescued some hours after, when Cromwell's Ironsides decided the fortune of the day. Ireton was one of the most implacable enemies of the king, and signed the warrant for his execution. When Cromwell passed over to Ireland to subdue that country he was accompanied by his son-in-law, on whose vigor, judgment, and tact he placed much reliance. Cromwell's presence, however, was soon required in Scotland, and the complete subjugation of Ireland was intrusted to Ireton. His career was brief, but successful. He was, however, unsparing in his severity. On Nov. 15, 1651, he died of the plague before the walls of Limerick. His remains were conveyed to England and interred in Westminster abbey; but after the restoration they were disinterred and burned at Tyburn. Ireton left one son and four daughters.

IRIARTEA, a genus of palms, all South American, having lofty, smooth, faintly ringed stems, and pinnate leaves with somewhat triangular leaflets. The leaf-stalks rise from a sheathing column. The PASHIUBA or PIJIUBA PALM (*I. erorhiza*), common in swamps and marshy grounds in the forests of the Amazon district, is remarkable for sending out roots above ground, which extend obliquely downwards, and often divide into many rootlets just before they reach the soil; the tree as it grows still producing new roots from a higher point than before, whilst the older and more central ones die, so that at last a lofty tree is supported as on three or four legs, between which a man may walk erect with a palm of 70 ft. high rising straight above his head. The outer wood is very hard, so as to be used for harpoons; splits easily, and into perfectly straight laths; is excellent for floors, ceilings, shelves, etc.; and is exported to North America for umbrella-sticks.

IRIDEÆ, or **IRIDA'CEÆ**, a natural order of endogenous plants, mostly herbaceous, although a few are somewhat shrubby. They have very generally either root stocks or corms. The leaves are generally sword-shaped, in two rows, and *equitant* (so placed that one seems to ride on the back of another). The perianth is 6-partite, colored, often very beautiful, in some regular, in others irregular. The stamens are three, with anthers turned outwards. The ovary is inferior; there is one style, with three stigmas, which are often petal-like, and add much to the beauty of the flower. The fruit is a 3-celled, 3-valved capsule. Almost 600 species are known, of which the greater number are natives of warm countries. They are particularly abundant in South Africa. A few are British. *Iris*, *gladiolus*, and *crocus* are familiar examples of the order. Saffron is the principal economical product. Acridity is a prevailing characteristic, and some species are medicinal; but the corms and root-stocks of some are edible.

IRIDIUM (syn. Ir, eq. 99—in the new system, 198—sp. gr. 21.15) is one of the so-called noble metals. It is occasionally found native and nearly pure in considerable masses among the Uralian ores of platinum, but is usually combined with osmium as an alloy in flat scales. It is a very hard, white, brittle metal, which may be melted by the oxyhydrogen blowpipe, or by the heat of a voltaic current. In its isolated form, it is unacted upon by any acid, or by aqua regia, but as an alloy it dissolves in the latter fluid. It forms three oxides, IrO , Ir_2O_3 , and IrO_2 , which pass readily into one another, and thus occasion the various tints which solutions of the salts of this metal assume. It was in consequence of these varying tints that the name of iridium, derived from *iris*, the rainbow, was given to this metal. Three sulphides and chlorides, corresponding to the oxides, have been obtained. This metal was discovered at the same time as osmium, in 1803, by Smithson Tennant.

IRIDOSMINE, a mineral alloy of iridium and osmium. It has a steel-gray color and metallic luster, and occurs in flattened grains about the size of a small pin-head. It is also found as a heavy gray powder. Its hardness is about equal to that of quartz, and its density ranges from 19.2 to 21.12. It is usually associated with platinum and with gold, bearing a small percentage to the latter. According to Dr. Torrey, the earlier assays at the assay office in New York yielded rather less than 1 oz. to \$1,000,000 of gold, but this increased to 7 or 8 oz., and again diminished. The chief use of iridosmine is in tipping the nibs of gold pens.

IRIS, in classic mythology, the daughter of Thaumas and Electra. She is described (in Homer) as a virgin goddess; but later writers state that she was married to Zephyrus, by whom she became the mother of Eros. She was employed, like Mercury, as the messenger of the gods, and to conduct female souls into the shades, as he conducted those of men. She is frequently represented on vases and in bas-reliefs as a youthful winged virgin, with a herald's staff and a pitcher in her hands. There can be no doubt that this myth originated in the physical phenomena of the rainbow, which was personified at first as the messenger of peace in nature.

The broad-colored ring in the eye is called the IRIS. See EYE.—IRIS is also the name of one of the planetoids (q.v.) discovered in 1847.

IRIS, or **FLOWER-DE-LUCE**, a genus of plants of the natural order *irideæ*, having the three outer segments of the perianth reflexed, the three inner arched inwards, and three petal-like stigmas covering the stamens. The species are numerous, chiefly natives of temperate climates. The YELLOW IRIS, or CORN FLAG (*I. pseudacorus*), is a well-known native of moist grounds in all parts of Britain, often spreading over a considerable extent

of land, and conspicuous even at a distance by its tall leaves and large deep-yellow flowers. The STINKING IRIS (*I. foetidissima*) is very abundant in some of the southern parts of England, but does not extend far north. It has vivid purple flowers. The leaves have a very disagreeable smell. The s. of Europe produces a greater number of species, as also does North America. The flowers of most of the species are beautiful. Some of them have received much attention from florists, particularly *I. xiphium*, sometimes called SPANISH IRIS; *I. xiphoides*, or ENGLISH IRIS; and *I. Germanica*, or COMMON IRIS, all corm-rooted species, and all European. Many fine varieties have been produced. The PERSIAN IRIS (*I. Persica*), the SNAKE'S-HEAD IRIS (*I. tuberosa*), and the CHALCEDONIAN IRIS (*I. Susiana*) are also much esteemed. The Persian iris is delightfully fragrant. The roots of all these species are annually exported in considerable quantities from Holland. Many other species are of frequent occurrence in flower-gardens.—The fresh rootstocks of *I. pseudacorus* are very acrid, as are those of many other species. Those of *I. Florentina*, *I. pallida*, and *I. Germanica* are orris root (q.v.). Those of *I. dichotoma* are eaten in Siberia; those of *I. edulis* at the cape of Good Hope.

IRISH (GAELIC) LANGUAGE AND LITERATURE. The Irish (Gaelic) is one of the still living Celtic languages (see CELTIC NATIONS). The alphabet consists of the following eighteen letters—*a, b, c, d, e, f, g, h, i, l, m, n, o, p, r, s, t, u*, corresponding in their forms with the Roman characters of the 5th c. after Christ. In Irish there is no indefinite article; nouns are masculine or feminine, and anciently a neuter gender existed. The nominative and accusative are the same in form, as are also the dative and ablative; the nominative and vocative feminine, and the genitive and vocative masculine, always have similar terminations. Nouns substantive have five, and nouns adjective four declensions. Verbs are active, passive, regular, irregular, impersonal, and defective; their moods are indicative, consuetudinal, past indicative, imperative, infinitive, and conditional; regular active verbs have no subjunctive; the tenses are the present, consuetudinal present, preterite, consuetudinal past, and future; in the tenses of the passive voice there is no distinction of number or person. Prepositions are rarely compounded with verbs or adjectives, instead of which the Irish use prepositions or adverbs placed after the verbs. Adverbial phrases composed of two or more parts of speech are very numerous both in ancient and in modern Irish. The simple conjunctions are few, but there are many conjunctional phrases. Interjections are numerous, and vary throughout the provinces. The regular versification of the Irish consists of four distinct meters, styled Oglachas, Droighneach, Bruilingeacht, and Dan Direach; of the last, there are five species, each distinguished by peculiar features. There are also classes of popular poetry possessing distinct linear and syllabic components. The best authorities on the Irish language are the *Irish Grammar*, by J. O'Donovan (1845); the *Grammatica Celtae* of J. C. Zeuss (1856); and *Irish Glosses* (1860), published by the Irish archæological and Celtic society.

The oldest existing specimens of the Irish language are to be found in sepulchral inscriptions in Ireland, and in the glosses or interpretations affixed to Latin words in documents transcribed by Irish ecclesiastics of the 8th and succeeding centuries, now preserved in some continental libraries. The principal ancient vernacular manuscripts in Ireland are *Leabhar na-h-Uidhre*, and the *Book of Leinster* (12th c.); the *Books of Ballymote, Lecan, and Dun Doighre*, or *Leabhar Breac* (14th c.); all compiled from older writings on historical and miscellaneous subjects. The most ancient manuscripts in Ireland containing original matter in the Irish language are the *Book of Armagh* (9th c.), and the *Book of Hymns*, of a somewhat later date, both ecclesiastical in their contents. The writings extant in the Gaelic language of Ireland consist of ecclesiastical documents, laws, bardic or semi-historic tales, historic tracts, genealogies, historic poems, treatises on medicine, translations from foreign authors, proverbs, compilations of the 17th c., popular poetry, political and satirical poems and songs, composed by native Gaelic writers in Ireland within the last century. Of the ecclesiastical documents the next in importance, after the *Book of Armagh* and the *Book of Hymns*, are the metrical Festologies of Ængus Ceile De (9th c.), the Martyrology of Tallaght (10th c.), and that of Mariamus O'Gorman (12th c.). In this department there are also extant many lives of saints, monastic rules, devotional and religious poems. A large body of old Irish jurisprudence, known as the *Brehon Laws*, is preserved in manuscripts of the 14th and 15th centuries. Of the Irish bardic or semi-historic tales, numbers are extant ranging in date from the 12th to the 18th century. The principal Irish historic tracts are those on the tribute styled *Borumha*, the wars of the Danes with the Irish, and the wars of Thomond. Copious genealogies of the principal native families exist in various manuscripts, and from such sources MacFirbis, a learned Irish antiquary of the 17th c., made an elaborate compilation known as *Leabhar Genealach*, or the "Genealogical Book," now considered a high authority. The chief composers of poems on the history of Ireland were Eochadh O'Flin (10th c.), Gilla Caemhain, and Flan of Monasterboice (11th century). The most important ancient Irish annals are those of Tighernach, of Ulster, of Inisfallen, and of Connacht.

The Irish manuscripts on medicine contain original treatises by native physicians of the 14th and 15th centuries, with commentaries on the then known medical authors of Europe and in the east. The Irish translations from foreign languages are chiefly

versions of mediæval Latin and continental books—historic, scientific, romantic, and religious. Of original adages and proverbial sentences great numbers exist, of various ages. The privileges enjoyed by the Irish poets under the clan system enabled them to devote themselves to the production of elaborate metrical compositions, many of which possessed high excellence, and elicited the praises of the poet Spenser. During the wars against Elizabeth the bards were energetic in stimulating the chiefs to whom they were attached. The merit of the elegiac poem on the deaths of the earls of Tyrone and Tyrconnell by their bard Mac an Bhaird, who accompanied them in exile (1608 A.D.), attracted the attention of the critical lord Jeffrey, who became acquainted with it through Mangan's English version in the meter of the original. Among the native writers in Ireland after the establishment of the English dominion, in the reign of James I., was Dr. Geoffrey Keating, compiler of a history of Ireland in the Gaelic language, and author of religious treatises and poems. About the same period historical and hagiographical compilations were made by the O'Clerighs, the most important of which was that styled the *Annals of the Kingdom by the Four Masters*, extending from the earliest period to 1616 A.D., edited in seven large volumes (Dublin, 1848), with an English version and copious notes, by the late Dr. John O'Donovan, the ablest of Irish scholars. The Gaelic continued to be the language of the native rural population of Ireland during the 17th and 18th centuries, and many religious and romantic pieces were composed in it for popular use. Differing from the English settlers in religious and political sentiments, the native Irish found gratification in satirizing and ridiculing them in the Gaelic language, in which they composed numerous songs in favor of the Stuarts, and denunciatory of the Hanoverians and their adherents. Members of old Irish families who attained high distinction in military service on the continent, retained with pride the Gaelic tongue; it was also commonly spoken by the soldiers in the Irish brigades in France, and in the American army during the war of independence. Various attempts were made since the middle of the last century to print Gaelic documents, but the critical knowledge of the language in its archaic forms having fallen into abeyance, such publications proved entirely unsatisfactory, until the subject was taken up about 1830 by government, during the progress of the ordnance survey of Ireland. From this may be said to date the true Irish school of accurate historic and linguistic learning, which has since produced many valuable volumes, under the superintendence of the antiquarian section of the royal Irish academy and the Irish archaeological and Celtic society. On the works issued by these two bodies, which for many years have included nearly all the most erudite scholars of Ireland, philological and historic students must now depend, as other publications on these subjects are, with few exceptions, illusory and misleading.

The Irish, in its modern forms, is still spoken commonly by the rural classes and native land-owners in Connaught, Munster, the remote parts of Ulster, the s. of Leinster, as well as in the islands off the western coast of Ireland. The provincial dialects vary considerably in words, pronunciation, and idioms. The Irish emigrants have carried their language across the Atlantic, and songs and poems in the Irish language and character occasionally appear in American newspapers. Professorships of the Irish language exist in Trinity college, Dublin; in the Queen's colleges at Belfast, Cork, and Galway; and in the Roman Catholic college at Maynooth. The chief collections of Irish manuscripts are those of the royal Irish academy and Trinity college, Dublin; numbers are also preserved in the British museum, in the Bodleian, and in some private libraries.

IRISH MOSS. See CARRAGEEN.

IRISH SEA, a continuation northward of St George's channel (q.v.), separates the n. of Ireland from the central districts of the United Kingdom. Between the coasts of Louth and Lancaster the Irish sea has a width of 120 m.; its greatest length between St. George's channel on the s. and the North channel on the n. is also about 120 miles.

IRISITE, a resinoid substance which is the principal constituent of the asphaltic mineral *grahamite*, which has been used successfully in making pavements (see PAVEMENT); also for gas-making. It was originally investigated by prof. Henry Wurtz. Grahamite is found in vertical fissures in horizontal rocks in Ritchie co., W. Va., and also at a place about 100 m. w. of Denver, Col. The mean of analyses of grahamite by prof. Wurtz gives: carbon, 78.66; hydrogen, 8.57; oxygen, 12.77; density, 1.145. The other ingredient of grahamite is viscosite (q.v.). Grahamite is black, and has a variable luster; is fusible under pressure, because of the viscosite constituent. It is very soluble in chloroform, benzole, bisulphide of carbon, and warm oil of turpentine. The viscosite is dissolved out of the grahamite by sulphuric ether or light petroleum naphtha. Irisite may be obtained from the residue by means of one of the grahamite solvents above mentioned, filtering and evaporating. When pure it is black, very brilliant, and infusible without decomposition. When its solutions are spread in thin films upon smooth surfaces, the most gorgeous rainbow hues are produced. If a mineral acid be added to a solution of irisite, the latter substance will coagulate, after which it is insoluble in all its former solvents, it having undergone a remarkable change. Analogous to grahamite is the mineral albutite, found in the province of New Brunswick, which also contains a small quantity of irisite and viscosite.

IRITIS is the term applied to inflammation of the iris. See **EYE**. The cavity across which the iris is stretched, and the iris itself, which projects into that cavity, and divides it into an anterior and a posterior chamber, are lined or invested by a membrane which resembles the larger serous membranes of the body, such as the pleura, peritoneum, etc., and consequently the inflammation of this membrane is of the adhesive kind. See **INFLAMMATION**. When it is added that the effusion of lymph may limit or entirely stop the movements of the iris, and may alter the form or even close up the aperture of the pupil, the serious nature of the disease will be at once perceived.

The *objective* symptoms of iritis (those which can be observed by the physician) are: 1. Redness of the eye, arising from vascularity of the sclerotic; 2. Change in the color of the iris. When lymph is effused in the texture of the iris, a gray or blue eye is rendered yellowish or greenish, while in a dark eye a reddish tint is produced. The brilliancy of the color of the iris also disappears. When the inflammation is very violent, or has been unchecked by remedies, suppuration may take place. 3. Irregularity and sometimes immobility of the pupil, produced by the adhesion of the back of the iris to the crystalline lens. The *subjective* symptoms (those of which the patient alone is conscious) are intolerance of light, dimness of vision, and pain in and around the eye.

The causes of iritis are various. The disease may arise from actual injury in surgical operations performed on the eye; from over-exertion, and too prolonged continuous use of the eye (thus it is common among needlewomen, engravers, and watchmakers); or from some constitutional taint, especially syphilis, gout, rheumatism, and scrofula.

The treatment of iritis varies to some extent according to the cause which induces it, but the great remedies are three. 1. *Blood-letting*, for the purpose of moderating the febrile disturbance, and of facilitating the operation of the second remedy, which is, 2. *Mercury*, which used to be given in large doses (such as two, three, or four grains, with a little opium, every four or six hours), but which is preferably given in small doses, such as two or three grains of hydrarg. c. cretâ, with a little hyoscyamus, two or three times in the 24 hours. This dose should be lessened as soon as the mouth begins to be tender, and by that time the lymph will be found to break up, and leave the pupil clear. 3. *Belladonna*. The pupil should be kept well dilated by the application of the extract of belladonna to the skin round the eye, or, far better, by the instillation into the eye of a weak solution of sulphate of atropine, with the view of preventing adhesion of the iris, or of breaking, or, at all events, of stretching and elongating any adhesive bands that may be formed; and thus of preventing any impairment of the movements of the iris, and any irregularity of the pupil after the inflammation shall have abated.

IRKUTSK', a government of eastern Siberia, bounded by the government of Jenisseisk, the government of Jakutsk and the Chinese empire, occupies an area of 307,990 sq. miles. The soil is partly fertile, partly hilly and marshy; the climate in general severe. The Baïkal and Nerchinsk mountains, with their numerous branches, give the country a high alpine character; besides these, the Saïan range extends along the southern borders, and the Jäblonovy or Apple range along the eastern. The principal rivers are the Lena, Shilka, Agún; the largest lake is the Baïkal (q.v.). The productions of the country are rye, wheat, barley, oats, rhubarb, hops; reindeer, sables, ermines, foxes, seals; fish—sturgeon, cod, silure; minerals—gold, silver, lead, jasper, amethysts, topazes, emeralds, yellow amber, rock-salt, and coal. The pop. of the government is (1870) 378,244, and consists of Buriats, Tunguses, and Russians. The inhabitants are for the most part employed in agriculture, and to some extent in fishing and hunting. As a local industry, the manufacture of an excellent oil out of stone-pine nuts deserves notice. The foreign commerce consists in the trade with China, carried on through Troitzko-Savsk and Kiachta (q.v.), and has risen to great importance in recent times.

The government of Irkutsk is divided into five districts—Irkutsk, Verkholensk, Bala-gansk, Nijneudinsk, and Kirensk. The capital is Irkutsk; the other towns are Telma, with a cloth-factory, Troitzko, Savsk, Kiachta, Kirensk on the Lena, Nijneudinsk, and Verholensk.

IRKUTSK, capital of the Russian government of that name, is the residence of the gov. gen. of eastern Siberia, and the seat of a bishop. It is situated on the right bank of the Angara, near its confluence with the river Irkut, in lat. 52° 17' n., and long. 104° 26' e., and is 3,842 m. distant from St. Petersburg. The town is about 1200 ft. above the level of the sea, and enjoys a very healthy climate, though in winter the cold is so severe as to freeze mercury. The streets are straight and wide, but ill-paved, and the houses mostly built of timber. The town possesses 23 Greek churches, 9 hospitals, a theater, 16 schools (including a *gymnasium*), and 86 factories or works. Besides these the town contains a public library, a museum of natural history, and some other public institutions. The pop. is about 32,000, consisting mostly of Russians and Buriats. Irkutsk was founded in 1661 by a Cossack chief named Iwan Pochapof, and owing to its position on the great thoroughfare between eastern and western Siberia, between China and Russia, it soon became the commercial center of Siberia, especially for the tea-trade. The current of the Angara is so rapid that the strongest frosts cover it but seldom with ice. Nevertheless, it is navigable, and constitutes the mainway for the goods

bound for Kiachta by means of lake Baikal, as well as for those coming from eastern Siberia, Russian America, and China to Irkutsk. The former are chiefly furs and metals; the latter, tea, meat, and fish from lake Baikal. The communications between Irkutsk and Jakutsk, and the other northern towns of Siberia, are carried on by the river Lena. The manufactures of Irkutsk are purely local, and supply the half-nomad Buriats and Tunguses inhabiting the adjacent country.

IRNERIUS, or GARNIA, b. Italy, 11th c.; was professor of Roman law in the university of Bologna.

IRON (sym. Fe [Lat. *ferrum*], eq. 28—in the new system, 56—sp. gr. 7,844) occurs more abundantly than any other metal. In its native form it is chiefly found in meteoric stones (see AÉROLITES), and in certain ores of platinum, and is consequently of comparatively rare occurrence, but the so-called iron ores—the oxides, sulphides, etc.—are very widely distributed. The most important of these ores are mentioned below.

Pure iron may be obtained by the ordinary method described below, and also by reducing the peroxide by means of hydrogen gas and heat, when it is obtained in the form of a fine black powder, or by heating the protochloride in a glass tube through which a current of dry hydrogen is passed. In this case, pure iron is deposited as a glistening mirror on the glass.

This important metal will be most conveniently considered under the three heads of

1. *Chemistry of Iron*.—Chemically pure iron is of so little general interest that we shall confine our remarks on the properties of this metal to those which are exhibited by bar or wrought iron. Its color is gray or bluish-white; it is hard and lustrous, takes a high polish, is fibrous in texture, and when broken across, exhibits a ragged fracture. It requires a very intense heat for its fusion, but before melting passes into a soft pasty condition, in which state two pieces of iron may, by being hammered together, be united or welded so completely as to form, to all intents and purposes, a single portion. At a red heat, it may be readily forged into any shape; but at ordinary temperatures it possesses very little malleability, as compared with gold and silver. In ductility, it stands very high, being barely exceeded by gold, silver, and platinum; and in tenacity, it is only exceeded by cobalt and nickel. Its susceptibility to magnetism is one of its most remarkable characteristics. See MAGNETISM. At a high temperature, it burns readily, as may be seen at the forge, or (more strikingly) when a glowing wire is introduced into a jar of oxygen. In dry air, and at ordinary temperatures, the lustrous surface of the metal remains unchanged; but in a moist atmosphere the surface rapidly becomes oxidized and covered with rust, which consists mainly of the hydrated oxide of iron. At a red heat, iron decomposes water, and liberates hydrogen, the oxygen combining with the iron to form the black or magnetic oxide (Fe_3O_4), which occurs in minute crystals. This is one of the ordinary methods of obtaining hydrogen.

The affinities of iron for most of the non-metallic elements are very powerful. The chief of the iron compounds are—

a. *Oxides of Iron*.—Iron forms four definite compounds with oxygen—viz. (1), the *protoxide* (FeO), which is the base of the green or ferrous salts of iron; (2), the *sesquioxide* or *peroxide* (Fe_2O_3), which is the base of the red or *ferrie salts*; (3), the *black* or *magnetic oxide* (Fe_3O_4), which is regarded by some chemists as a compound of the two preceding oxides; and (4), *ferrie acid* (FeO_3). The *protoxide* cannot be obtained in an isolated form, but it forms the base of various ferrous salts, and combines with water to form a hydrate ($FeO \cdot HO$), which, on the addition of an alkali, falls in white flakes.

The most important protosalts of iron, or ferrous salts, are the carbonate, the sulphate, the phosphate, and the silicate.

Carbonate of iron ($FeO \cdot CO_2$) exists naturally in various minerals, and may be obtained artificially by precipitating a soluble protosalt of iron with carbonate of potash or soda, when the carbonate falls in white flakes. On exposure to the air, it absorbs oxygen, and gives off carbonic acid, and is thus converted into the hydrated peroxide. *Sulphate of iron* ($FeO \cdot SO_3 + 7HO$) is obtained by the solution of iron, or its sulphide, in dilute sulphuric acid; in the former case, there is an evolution of hydrogen, and in the latter, of sulphureted hydrogen. The reactions in the two cases are expressed by the equations,

On evaporation of the solution, the salt is obtained in clear bluish-green rhomboidal crystals, containing seven atoms of water. This salt is commercially known as copperas or green vitriol, and its various applications in technology are noticed in the article VITRIOLS, BLUE AND GREEN.

Phosphate of iron is obtained by precipitating a solution of a protosalt of iron with phosphate of soda, when a white precipitate of phosphate of iron is thrown down.

All these salts, especially the carbonate and sulphate, are extensively used in medicine.

Silicate and phosphate of iron occur naturally in several minerals.

The *peroxide of iron*, termed also sesquioxide, red oxide, or ferric oxide, is obtained in an anhydrous form by igniting the protosulphate, and is known in the arts under the names *colcothar*, *crocus of Mars*, or *rouge*, according to the degree of levigation to which

it has been submitted. It is employed for polishing glass, jewelry, etc., and is also used as a pigment. It occurs both in the anhydrous and in the hydrated form in various minerals.

The hydrated peroxide ($2\text{Fe}_2\text{O}_3 \cdot 3\text{HO}$) is obtained by precipitating a solution of a persalt of iron, or of a ferric salt, with an excess of potash, ammonia, or alkaline carbonate. It falls as a yellowish-brown flocculent precipitate, which when dried forms a dense brown mass. This hydrated peroxide of iron, when freshly prepared and suspended in water, is regarded as an antidote in arsenical poisoning. Rust, as has been already mentioned, is a hydrated peroxide, combined with a little ammonia.

The most important of the persalts of iron, or ferric salts, are the neutral and the basic sulphate, whose formulæ are $\text{Fe}_2\text{O}_3 \cdot 3\text{SO}_3$ and $\text{Fe}_2\text{O}_3 \cdot 3\text{SO}_3 \cdot 5\text{Fe}_2\text{O}_3$ respectively, the nitrate ($\text{Fe}_2\text{O}_3 \cdot 3\text{NO}_5$), the phosphate, and the silicate. Of these, the neutral sulphate, the phosphate, and the silicate occur in various minerals. The nitrate, which is obtained by the solution of iron in nitric acid, is a useful medicinal agent.

The *black or magnetic oxide* and *ferric acid*, which has not been obtained in a free state, and is only known as a constituent of certain salts, must be passed over without comment.

b. *Haloid salts of iron*—the chlorides, bromides, and iodides—next require notice. There are two chlorides—viz., a protochloride (FeCl) and a perchloride or sesquichloride (Fe_2Cl_3). The latter may be obtained by dissolving peroxide of iron in hydrochloric acid. The tincture of the sesquichloride of iron is perhaps more generally employed in medicine than any other preparation of this metal. The protiodide is an extremely valuable therapeutic agent.

c. There are probably several *sulphides* or *sulphurets of iron*. The ordinary sulphide is a protosulphide (FeS). It occurs in small quantity in meteoric iron. It may be obtained artificially by the direct union of the two elements at a high temperature, or by the precipitation of a protosalt of iron by sulphide of ammonium. It exists in glistening masses, varying in color from a grayish yellow to a reddish brown. It is insoluble in water, but in moist air becomes rapidly oxidized into protosulphate of iron. With acids, it develops sulphureted hydrogen. The bisulphide of iron (FeS_2) is the *iron pyrites* of mineralogists, and the *mundic* of commerce. Under the latter name, it is used extensively in the preparation of oil of vitriol. There are also other sulphides of less importance.

The *protosalts* and the *persalts*, or the *ferrous* and the *ferric salts*, give totally different reactions with the ordinary tests. The solutions of the former have a greenish color and a peculiar metallic taste, while those of the latter are generally of a brownish-yellow color, and are very acid. Sulphureted hydrogen gives no precipitate with an acid solution of a ferrous salt, while it gives a milky precipitate of sulphur with a solution of a ferric salt. Potash, soda, and ammonia throw down a white hydrated oxide from the former, and a brown hydrated peroxide from the latter. Ferrocyanide of potassium gives with ferrous salts a white precipitate, which soon becomes blue, while with ferric salts it at once produces a blue precipitate, even in a very dilute solution. Tincture of galls (tannic acid) produces no immediate change of color with the ferrous, but a deep blackish-blue color (ink) with the ferric salts. Sulphocyanide of potassium produces no change with the ferrous, but gives a deep blood-red tint with the ferric salts. Succinate and benzoate of ammonia produce no precipitate or change of color with the former, while with the latter, if the solution is not too acid, they throw down pale reddish-brown precipitates.

2. *Manufacture of Iron*.—The increasing use of iron is a prominent characteristic of the present age, and every day sees some new application of it in the arts of life. Although the most useful of the metals, it was not the first known. The difficulty of reducing it from its ores would naturally make it a later acquisition than gold, silver, and copper (q.v.). See also BRONZE, and BRONZE PERIOD. The reduction of the ore known as the black oxide of iron, however, has been carried on in India from a very early time.

In Europe the rich specular and other ores of Spain and Elba were much used during the Roman period; in Greece, also, iron was known, though, as among the Romans, its use was subsequent to that of bronze. We are informed, too, by the Roman historians that this metal was employed by the ancient Britons for the manufacture of spears and lances. The Romans, during their occupation of Britain, manufactured iron to a considerable extent, as is evidenced by the cinder-heaps in the forest of Dean and other places. The rude processes then in use left so much iron in the cinders that those of Dean forest furnished the chief supply of ore to 20 furnaces for between 200 and 300 years. In those early times, the iron ores were reduced in a simple conical furnace, called an air-bloomery, erected on the top of a hill, in order to obtain the greatest blast of wind. The furnaces were subsequently enlarged and supplied with an artificial blast. Charcoal was the only fuel used in smelting till 1618, when Lord Dudley introduced coal for this purpose; but the iron-masters being unanimously opposed to the change, Dudley's improvement died with himself. It was not reintroduced till Abraham Derby, in 1713, employed it in his furnace at Coalbrook Dale. But as this method was not properly understood, the production of English iron declined with the change of fuel, till, in 1740, it was only three-fourths of what it had formerly been. About 10

years after this, however, the introduction of coke gave renewed vigor to the iron-trade, and then followed in rapid succession those great improvements in the manufacture which have given to the history of iron the interest of a romance. The introduction of Watt's steam-engine in 1770, the processes of puddling and rolling invented by Henry Cort in 1784, and the employment of the hot-blast by Neilson of Glasgow in 1830, have each been of inestimable service. The greatest improvement introduced into the iron manufacture in recent times is the process of Mr. Bessemer for the production of steel, patented in 1856 (see BESSEMER PROCESS). The "Siemens-Martin" method of making steel has also of late come into extensive use. An important new process for steel is patented by S. T. Thomas.

Iron ores are abundantly distributed over the globe; the chief kinds being—1. Magnetic iron ore; 2. Red hematite, specular, or red iron ore; 3. Brown hematite or brown iron ore; 4. Carbonate of iron, including spathic ore, clay ironstone, and blackband ironstone.

The ore richest in the metal is the *magnetic* (see MAGNETISM), or *black oxide of iron*. When pure it contains nothing but oxygen and iron, its chemical formula being Fe_3O_4 , which gives 73 per cent of iron by weight. It occurs in dark heavy masses of black crystals, and is found in the older primary rocks. Sweden is famous for this ore, and for the iron produced from it, which is esteemed the best in Europe. The celebrated mines of Dannemora, in that country, have been constantly worked since the 15th century. Russia, too, has great iron works in the Ural mountains, which are supplied with this ore. So, also, have Canada and several of the American states, as Virginia, Pennsylvania, New Jersey, etc. The rock formations in which magnetic iron ore occurs very rarely contain coal, hence it is almost always smelted with wood-charcoal, which, as it contains no sulphur, is one great cause of the superiority of the iron produced from it.

Red hematite differs from the last only in containing proportionally a little more oxygen, its formula being Fe_2O_3 , that is to say, 70 per cent of iron by weight. There are several varieties of this ore, but only two need be referred to. The first of these, *specular iron*, so called from its bright metallic luster, occurs in large and beautiful crystalline masses in the island of Elba, where it has been worked for more than 2,000 years, and is likewise found in many other parts of the world. It is of a steel-gray color, assuming a red tint in thin fragments and when scratched. The other variety is *kidney ore*, whose origin is still a curious problem, as its deposits occur sometimes in veins and sometimes in apparently regular beds. Its characteristic form is in large kidney-shaped nodules, with a fine radiated structure. This shape, however, is only assumed in the cavities of massive deposits. Red hematite is sometimes called blood-stone. It is used for polishing metals, and yields a blood-red powder, used as a pigment. This valuable iron ore is found in many countries, but in few places in greater abundance than at Whitehaven and Ulverstone, in the n.w. of England, where splendid masses of it occur, 15, 30, and even 60 ft. in thickness. These two districts produced, in 1877, about 2,285,000 tons of hematite.

Brown hematite, or brown iron ore, is a hydrated peroxide of iron, and has the same composition as red hematite, except that it contains about 14 per cent of water. It is generally found massive, more rarely crystalline, and a variety occurring in small rounded nodules is called *pea iron ore*. When mixed with earth or clay, it forms the pigments yellow ocher and brown umber. Brown hematite is now an important ore in Great Britain, about 2,000,000 tons being annually raised. It occurs in different geological formations, chiefly in Devonshire, the forest of Dean, South Wales, and in the co. of Antrim in Ireland; also in an earthy form in Northamptonshire. It is the ore chiefly smelted in France and Germany.

Bog iron ore is a variety of brown hematite, usually containing phosphorus, which occurs in marshy districts of recent formation.

Carbonate of iron, when found in a comparatively pure and crystallized state, is known as *spathic*, *spathose*, or *sparry iron ore*; but when impure and earthy, as *clay ironstone* and *blackband ironstone*. Spathic ore was little worked in England previous to 1851, soon after which it was discovered in Somersetshire. It forms mountain masses in various parts of Prussia and Austria, and is now much in demand to yield the spiegeleisen required in the Bessemer process. In its purest form it contains 48 per cent of iron; and in color it varies from white to buff or dark brown, some specimens of it taking a beautiful polish, and looking like marble. The clay and blackband ironstones are essentially mixtures of carbonate of iron with clay, blackband having also a considerable proportion of coaly or bituminous matter. These dull earthy-looking ores occur abundantly in Great Britain, and form, after coal, the greatest of her mineral treasures. Fully one-third of all the ore mined in the country is obtained from the coal-measures, where fortunately both the fuel and the limestone, indispensable for the reduction of the iron, are also found. The ore occurs as balls or nodules in the shales, or in continuous beds. Some of these seams are full of fossil shells, and the ore is then called "musselband" ironstone.

Formerly, the three great iron districts of Britain were South Staffordshire, South Wales, and Central Scotland, each producing nearly equal quantities, and together yielding about four-fifths of the total produce of the country. Now, however, the South

Staffordshire field is becoming exhausted, its produce being only about a fourth of what it was, while that of the South Wales and Scottish districts has increased, and is now yielding annually, the former a million and a quarter, and the latter more than three million tons of ore. North Staffordshire, Shropshire, Derbyshire, and the West Riding of Yorkshire, are the principal remaining districts yielding ores from the carboniferous beds. The iron from the West Riding ore is the best in Britain as regards quality.

There is yet another great iron district, yielding an ore belonging to a more recent formation than the carboniferous—namely, the lias. This deposit, which scarcely more than 30 years ago was unknown, is now producing iron to the enormous amount of 1,375,000 tons per annum. It is the ironstone of the Cleveland hills, in the n.e. of Yorkshire, which, from its resemblance to common sandstone, passed unnoticed till 1847. About that time, isolated blocks of it, found on the sea-coast, were discovered to contain about 30 per cent of iron. On further examination of the district these were proved to be detached pieces of a massive bed, no less than 15 ft. thick, which could be traced for many miles along the sides of the hills. Some idea of the value of this vast deposit of iron ore will be found in the fact, that the ironstone seams of the coal-measures seldom exceed 20, and are worked as low as 8 inches in thickness. Another mass of ironstone of great thickness, also belonging to the lias beds, was more recently discovered in North Lincolnshire. In the oolite, too, beds of brown iron ore have been discovered in several counties, but chiefly in Northamptonshire, where it has been worked with so much spirit, that about a million tons of ore per annum are now raised.

To those remarkable discoveries may be added that by Mr. Rogers of Abercarn, who first detected, some years ago, the value of the spathic ore in the Devonian rocks of Somersetshire, now largely worked. We may state, too, that hematite has recently been mined to some extent in the Shetland islands. About 420,000 tons of what is called "burnt ore" are now yearly obtained in Great Britain from the residue of iron pyrites (sulphide of iron) which has been burned to yield its sulphur for the manufacture of sulphuric acid. Fully 1,000,000 tons of iron ore are now annually imported.

Before proceeding to describe the manufacture of iron, we give two analyses of British ores: the first is by Mr. J. Spiller, taken from a series published in the *Memoirs of the Geological Survey*, and the second is by Dr. Murray Thomson.

It will be noticed that in the case of these ores the impurities are rather numerous. Nevertheless, the modes of preparing and smelting them are somewhat rude and simple, as the low price of iron will not permit of its ores being treated with the same care as the ores of lead, copper, tin, and some other metals.

Iron ore is still reduced in the s. of Europe by the old and imperfect process of the Catalan forge, not unlike a common smith's forge. In Great Britain, however, as well as in all other countries where iron is largely smelted, the blast-furnace is now universally employed, by means of which the metal is obtained in the state of crude or cast iron. For the finer kinds of iron, charcoal is the fuel employed, because, unlike coal or coke, it contains no sulphuret of iron or other injurious ingredients. The Russian and Swedish furnaces smelt with charcoal, and on this, as much as on their pure ores, depends the high reputation of their iron. A solitary charcoal-furnace at Ulverstone in England, and another at Lorn in Scotland, are still working—the only relics of times past, when this was the only fuel employed.

As a preliminary process to the actual smelting in the blast-furnace, clay and blackband ironstones are generally roasted. This is accomplished by breaking the ore into small pieces, spreading it in open heaps on the ground, and mingling it more or less with small coal according to the nature of the ore. Blackband commonly contains enough of carbonaceous matter to burn without the addition of coal. The pile, which may contain from one to several thousand tons of ore, is lighted at the windward end, and burns gradually along, aided by occasional fires in the sides, till the whole heap has undergone

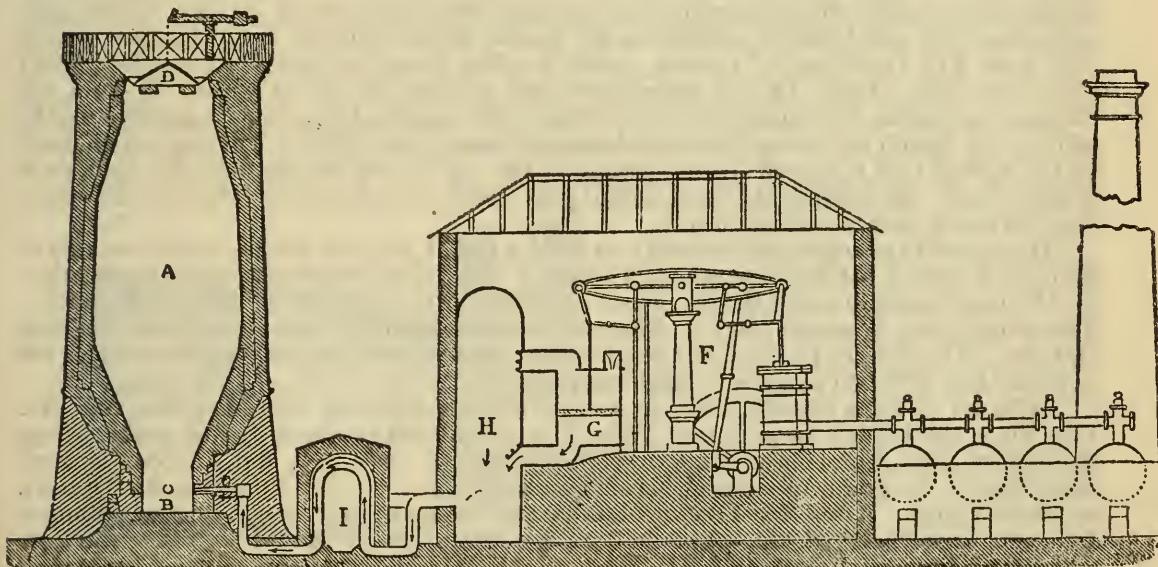

FIG. 1. Hot Blast-furnace.

calcination, the time required for this purpose being generally about a month. Sometimes the operation of roasting is performed in close kilns, instead of open heaps, a mode by which the ore is considered to be more uniformly roasted, and with considerably less fuel. Of late years, the kilns are often heated by the waste gases of the blast-furnace. By calcination, clay ironstone loses from 25 to 30, and blackband from 40 to 50 per cent of its weight, the loss consisting chiefly of carbonic acid and water, but sulphur and other volatile substances are also dissipated in the process. The roasting also converts the protoxide and carbonate of iron into peroxide, which prevents the formation of slags of silicate of iron, such slags, owing to the difficulty of reducing them, causing a loss of iron. In this country rich ores like the magnetic or red hematite are not subjected to calcination, but they are so in Sweden.

The older type of blast-furnace consists of a massive tower of stone or brick-work strengthened with iron binders; the newer plan is to build it of comparatively thin brick-work, and surround it entirely with strong iron plates. In either case an inner lining of refractory fire-brick is given to it, which is separated from the outer portion of the wall by a narrow space filled with sand. Internally they vary much in form, but perhaps the barrel shape is the most prevalent, and most of them contract towards the bottom in the shape of an inverted cone. Recent ones have been built from 80 to 100 ft. in height, instead of not more than 60 as formerly. The blast-pipe, with its tuyere-branches, surrounds the hearth, and on one side there is a recess and openings for running off the metal and slag. See BLAST-FURNACE.

Fig. 1 is a sectional view of a hot blast-furnace, with the blowing-engine and other appliances, which is taken, with some modification, from Mr. Fairbairn's work on iron.

It may be well to state here that one engine usually supplies the blast to several furnaces. A is the body of furnace; B the hearth, above which are placed the tuyeres, C; D is the bell and cone arrangement, around which there is a gangway to enable the workmen to feed the furnace. The blowing-engine is shown at F. Air is forced into the furnace by means of the blowing cylinder, G, from which it passes into the receiver, H, and thence along a pipe into the heating-oven, I. Here a large surface of pipe is exposed, in arch-shaped rows, to the fire, which heats the inclosed air to from 600° to 1000° F. At some temperature within this range it enters the lower part of the furnace by means of the tuyeres, C. Some of the larger blowing-engines discharge 60,000 cubic ft. of air per minute, under a pressure of 3½ lbs. per sq. inch. See BLOWING-MACHINES.

The bell and cone at D is for the purpose of closing the mouth of the furnace so as to save the "waste gases," chiefly carbonic oxide, which are allowed to escape in open-mouthed furnaces (see BLAST-FURNACE). These are conveyed away by pipes from openings just under the cone at D, and are turned to raise steam, heat the blast, etc.

The operation of smelting is thus performed: The roasted ore, coal, and lime (flux) are either hoisted, or, if the nature of the ground permits, moved along a platform or gangway to the gallery near the top of the furnace, and fed into it at intervals through the openings in the side, when the mouth is open, or by lowering the cone D, when it is closed. We may here state that the furnace is kept continually burning except when under repair. The materials are of course raised to a very high heat, and gradually fuse into a softened mass. The clay of the ironstone then unites with the lime to form a coarse glass or slag; the oxide of iron at the same time gives up its oxygen to the fuel, and allows the metal itself to collect on the hearth at the bottom of the furnace, united with from 3 to 5 per cent of carbon, which it takes from the fuel, forming the variety called cast-iron. Every 12, and sometimes every 8 hours, the metal is run off from the furnace, by means of a tap-hole at the bottom of the hearth, into rows of parallel molds, called pigs, which are formed in sand, hence the name "pig-iron." The slag which floats on the melted iron is run off by an opening at the top of the hearth. If the furnace is working well, the slag should be of a light-gray color; a dark-brown or black color shows that too much iron is passing into it.

The quantity of materials necessary to yield a ton of pig-iron may be taken roundly as follows: 2 tons of calcined ironstone; 2½ tons of coal, of which about 8 cwt. are required for the blowing-engine and hot-air pipes; and from 12 to 16 cwt. of broken limestone. The proportions, however, vary in different districts according to the nature of the fuel and ore. The weekly produce of a single blast-furnace varies extremely—from under 100 to more than 500 tons in some of the larger furnaces.

Different districts classify their pig-irons in slightly different ways, but, as a rule, No. 1 to No. 4 are known as gray iron. No. 1 is largest and brightest in the grain, brings the highest price, and is best adapted for fine castings. Nos. 2, 3, and 4 become successively less in the grain, of a duller luster, and lighter in color, but up to No. 3 are known as foundry pigs. After No. 4 the metal ceases to be gray, and though higher numbers are sometimes employed, the other qualities are more usually known as forge, mottled, and white pig-irons. Gray iron has its carbon partly in the chemically combined, but chiefly in the uncombined or graphitic state, and requires a higher temperature to melt it than white iron, though very fluid when melted. White iron has its carbon wholly in the combined state, and is chiefly available for conversion into malleable iron. Hematite pig-iron suitable for making Bessemer steel has an exceptionally high value.

The hot-blast process which has been described above was introduced in 1830 by Mr. James B. Neilson of Glasgow, and has been productive of very remarkable effects on the iron trade. The whole invention consists in simply heating the air blown into the furnace, and yet the saving of fuel by this is about one-half, and the production of iron, since it came into use, has enormously increased. The "cold-blast" is still, however, to a limited extent employed, and produces the strongest iron, though necessarily at a much higher cost. The difference in quality appears to be caused by the greater heat in the case of the hot blast facilitating the passage of impurities into the iron.

Of late years much attention has been given to plans for saving fuel in the blast-furnace. Previous to the introduction of the hot-blast as much as 8 tons of coal, as coke, were consumed for every ton of pig-iron made. Even when this is reduced to under 3 tons of raw coal per ton of pig-iron, fully three-fourths of all the heat produced is still wasted in open-mouthed furnaces. The method of saving the waste gases by closing the mouth of the furnace, as shown in fig. 1, now generally adopted when coke is used, is attended with so much economy, that, in the Cleveland district alone, 600,000 tons of coal per annum are saved by adopting it. There being a difficulty in closing the mouth of the furnace when raw coal is used, Mr. Ferrie of Monkland, a short time ago, patented a self-coking blast-furnace, by which, among other advantages, the gases can be saved. It has now been in use for some years in Scotland, and produces a ton of pig-iron with 34 instead of 53 cwt. of coal previously required. Raising the temperature of the blast to from 900° to 1000° F. has also been attended with a saving, and so likewise, in some districts, has an addition to the height of the furnace.

We pass now to the consideration of malleable or wrought iron. It differs from cast-

iron in being almost free of carbon. The great object in the processes adopted for the conversion of cast into malleable iron, accordingly, is to deprive the former of its carbon. But it is also very desirable to get rid of deleterious ingredients, such as silicon, sulphur, and phosphorus, which latter are generally present in minute quantities in the cast-iron. The ordinary processes for the manufacture of malleable iron are *refining*, *puddling*, *shingling* or *hammering*, and *rolling*. The refinery is shown in section in fig. 2. It consists of a flat hearth, A, covered with sand or loam, and surrounded with metal troughs, B, through which a stream of water is constantly flowing, to keep the sides from melting. C are the tuyeres in connection with the blowing-engine. The cast-iron is melted with coke on the hearth, and a blast of air kept blowing over it, which causes its carbon to unite with the oxygen of the air, and pass off as carbonic oxide gas. Oxygen also unites with silicon to form silica, and with iron to form the oxide. The silica of the sand uniting with oxide of iron, produces a slag of silicate of iron. The refined metal is finally run out in cakes on a bed of cast-iron, kept cool by a stream of water. Being only partially decarbonized by this process, it is next broken up for the puddling furnace. About 10 per cent of iron is lost in the refinery.

Fig. 3 shows a puddling furnace in longitudinal section. B represents the hearth; A, the grate or fire-place; and C, the chimney, which has a damper at the summit to regulate the draught.

The grate is separated from the hearth by means of a bridge, D, which prevents the direct contact of the fuel with the iron. White pig-iron, or at least such kinds as contain carbon in the combined state only, are best suited for puddling, because they become pasty, and so more easily worked than gray iron containing graphitic carbon, which does not soften into this condition previous to fusion. It is only in some districts that the "refining" process is much used, in others a portion only of the puddling

furnace charge is refined; and in making inferior kinds of malleable iron, the pig-iron is not previously refined at all. There are two ways of puddling now practiced: the first or older way, best applicable to refined iron, is called *dry puddling*, and in it the decarburization is produced chiefly by a strong current of air passing through the furnace; the second, or newer process, is called *wet puddling* or *boiling*, in which case the oxidizing of the carbon is effected chiefly by hematite, magnetic ore, basic slags, and other easily reduced materials, but to some extent also by the air.

The operation of puddling, though differing in its details according to circumstances, is in a general way conducted as follows: A charge of from $4\frac{1}{2}$ to 5 cwt. of metal, including some hammer slag and iron scale, is placed on the bed of the furnace while still hot from previous working. In about half an hour, when the furnace is in working order, the charge is melted, and is then stirred or "rabbled" for a considerable time, when it begins to "boil" by the formation and escape of carbonic oxide, which forms jets of blue flame all over the surface. Gradually, as the carbon of the pig-iron is more and more oxidized, pasty masses of malleable iron separate, and these are removed in balls commonly weighing about 80 lbs., but sometimes larger. About an hour and a half is required to work off a charge, and it takes from 22 to 26 cwt. of pig-iron to produce a ton of malleable iron. Siemens's regenerative gas-furnace, in which inferior fuels can be utilized, is applied to puddling as well as to other metallurgical processes; but our space is too limited to give any of its details, or to describe the more recent revolving puddling furnace of Mr. Danks, which is the most promising of any of the attempts yet made to puddle iron by mechanical means.

The process immediately following the puddling or boiling is called "shingling," and consists in hammering the puddled balls with either the helve or steam-hammer, or in passing them through a *squeezier* till they are sufficiently consolidated, and the greater part of the cinders forced out. For a description of the steam-hammer, which is much used for heavy forgings as well as for shingling, see that head. Puddled balls which

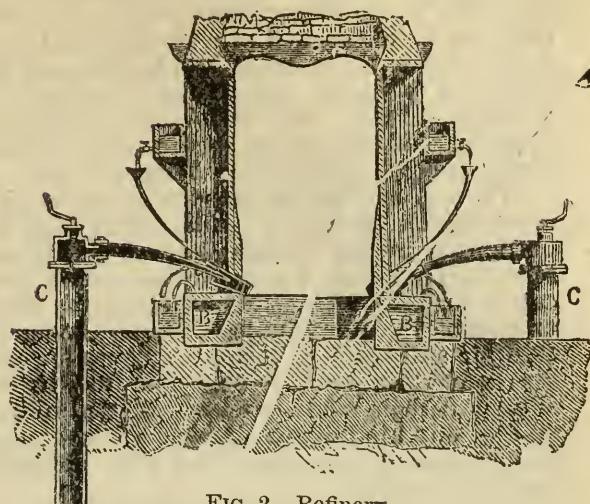

FIG. 2.—Refinery.

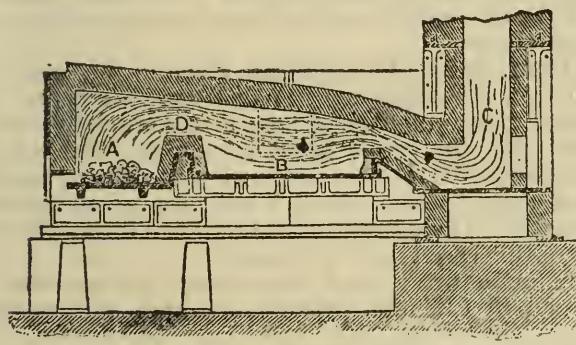

FIG. 3.—Puddling Furnace.

have undergone shingling are called *slabs* or *blooms*. These are next passed through heavy rollers termed "forge" or "puddle-bar rolls," and reduced to the form of a flat bar. For all the better kinds of iron the bars thus treated are cut into short lengths, piled together, reheated in a furnace, and again passed through the forge rolls. Once more the iron is cut, piled, and heated, and then passed through the "mill-train," consisting of what are termed the "bolting" or "rough rolls," and finally through the "finishing rolls." Both these sets of rolls in the case of plates and sheets are plain, but in the case of bars are grooved, so as to form them into the required shape, such as flat, square, round, octagonal, or T-shaped iron.

There is still another important variety of iron, viz., *steel*, the manufacture of which remains to be described. Steel differs from malleable iron in containing a varying proportion of carbon, usually from .5 to 1.8 per cent. When rich in carbon, it closely resembles cast-iron in composition, except that it is more free from impurities. Steel can be made by adding carbon during the direct reduction of a pure iron ore in a furnace or crucible, but the results of this method are scarcely ever uniform. The finer kinds of steel are still made by the old cementation process—that is, by the roundabout plan of first converting cast into malleable iron, by depriving the former of its carbon, and then adding carbon again by heating the iron with charcoal (see BLISTER STEEL). In making any kind of steel, however, the getting rid of silicon, phosphorus, and sulphur is as important, and a matter of more difficulty than the securing of any required proportion of carbon.

As blistered steel is full of cavities, it is necessary to render it dense and uniform, especially for the finer purposes to which steel is applied. By one method it is converted into what is called "shear steel." This is done by breaking the bars of blister steel into short lengths, heating them in bundles, and partially welding with a forge-hammer. The rod so formed is heated again, and now brought under the action of the tilt-hammer. Here, by a succession of blows, it is formed into bars, which are much more compact and malleable than blister steel, and consequently better fitted for edge-tools and the like. If the single-shear steel is doubled upon itself, and again welded and drawn into bars, it is called double-shear steel. By another method, viz., that of melting the blister steel in fire-clay crucibles, and casting it into ingots, "cast-steel" (q.v.) is made. This is the best kind of steel, being finely granular, homogeneous, dense, and well adapted for the finest cutting instruments.

Steel is now largely made directly from pig-iron by puddling, much in the same way as that process is applied to the production of malleable iron (see KRUPP'S STEEL). By another plan (Uchatius's process), pig-iron is granulated and heated in a crucible with the oxides of iron and manganese, and fire-clay, the result being cast-steel. This process has succeeded well in Sweden. The Siemens-Martin process consists in melting pig-iron along with malleable iron and Bessemer steel scrap, about 7 per cent of spiegeleisen being added towards the end of the process. The operation is conducted in the Siemens regenerative furnace, and the product in this case is also cast-steel.

There are also several modes of manufacturing steel direct from the ore, such as by the old way in the Catalan forge, and by Chenot's process, in which hydrocarbons are used.

Bessemer's method of producing malleable iron directly from pig-iron is altogether a failure. Steel, however, is successfully and largely made by his process, which consists in blowing air through molten pig-iron till the whole of the carbon and silicon is removed by oxidation, and then introducing into the melted iron a given quantity of spiegeleisen (a peculiar kind of cast-iron), containing a known percentage of carbon (see BESSEMER PROCESS).

It would appear from the results of recent experiments made on the large scale at Middlesborough, that Messrs. Thomas & Gilchrist have succeeded, by a comparatively simple device, in practically eliminating the phosphorus from Cleveland pig-iron during the conversion of the latter into steel in the Bessemer converter. The great importance of this discovery will be at once understood when we state that the Cleveland iron is the cheapest in Great Britain, and that the Cleveland ore yields one-fourth of all the iron made in the country. Hitherto it has not been remunerative to make steel from this pig-iron on account of the exceptionally high percentage of phosphorus it contains, and the difficulty there has been of removing an ingredient so deleterious to steel. Success, however, has at length been achieved by obtaining, through the use of lime and oxide of iron, a basic slag in the converter, and by lining this vessel with bricks made chiefly of magnesian limestone fired at a very high heat. A basic lining is thus given to the converter instead of the ordinary siliceous one, which is acid, and so a base is furnished with which the phosphoric acid can combine without the certainty of the lining being eaten away by the basic slag, as would be the case when this lining is siliceous. It is only as respects the nature of the slag in the converter, and the kind of lining used for this vessel, that Thomas & Gilchrist's mode of making steel, as far as it has yet been tried, differs from Bessemer's; except that for the latter a high-priced pig-iron is required. Of course steel can be made by the new process from other low-priced irons besides Cleveland.

We will now take a glance at the properties of each of the three principal kinds of iron, and the purposes to which it is chiefly applied. Cast-iron, as the crudest, cheapest, and most fusible, is used for the heavy portions of engineering work, such as bed-plates for machines, cylinders, columns, cisterns, low-pressure boilers, water and gas pipes,

rollers, girders, and the like. A large quantity is consumed in the manufacture of "hollow-ware," which includes pots, pans, and other cooking-vessels. For all kinds of ornamental objects, again, it is almost exclusively used, because here its property of being readily cast into molds gives it a great advantage on the score of cheapness.

Malleable iron differs considerably in its properties from cast-iron. The latter is practically incompressible, but it can be comparatively easily torn asunder. Malleable iron, on the contrary, possesses great tenacity; it is, moreover, very malleable and ductile, especially at a high temperature, so that it can be rolled into sheets as thin as paper, or drawn into the finest wire. Further, it possesses the valuable property of welding—that is, two pieces can be completely united together by hammering at a white heat. Malleable iron is largely employed for the innumerable variety of articles included under the general term "hardware," such as locks, keys, hinges, bolts, nails, screws, wire-work, and the so-called tin-plate, which is merely sheet-iron dipped in melted tin. It is the mainstay of the railways and the electric telegraph, and has almost displaced timber as a material for steamships and sailing-vessels. It is also much used for roofs and bridges of large size. Rolled armor-plates for war-ships and fortifications are now made of malleable iron from 5 to 22 in. thick.

Steel possesses several valuable properties which do not belong to either cast or wrought iron. It is harder, denser, and whiter in color. It is also more elastic, takes a higher polish, and rusts less easily. Like malleable iron, it is also weldable. But its most characteristic property consists in its admitting of being tempered at will to any degree of hardness. If, for instance, a piece of steel be heated to redness and plunged into water, it is made hard and brittle; but if it be again heated and slowly cooled, its original softness is restored. By gently reheating the steel it will acquire a gradation of tints indicating various degrees of hardness, beginning with pale straw color, and passing successively to full yellow, brown, purple, and finally to blue. The straw color is the result of a temperature of about 440°, and the blue of about 570° F., the former being the hardest and the latter the softest tempering.

The use of steel is no longer confined to such small articles as files, edge-tools, knives, and other cutlery. By means of improved machinery and processes, steel is at present manufactured on a scale that was little dreamed of thirty years ago, so that such objects as field-guns, heavy shafting, tires, rails, boiler-plates, and the like are now being made of this material. The superior tensile strength of steel, which is about double that of malleable iron, gives it a great advantage where lightness is required. Large numbers of steamships are now being built of steel.

In 1740 the entire quantity of iron made in Great Britain is believed not to have exceeded 25,000 tons; in 1802 the annual make was estimated at 170,000; in 1828, at 702,584; and in 1839, at 1,512,000 tons. In 1854, the first year of the carefully collected statistics now published annually by the mining record office, the produce was 3,069,838, and from that time to the present it has gradually risen to nearly 7,000,000 tons. A very large amount of this pig-iron is converted into malleable iron, as there are now upwards of 7,000 puddling furnaces in the country. In the United States about 2,830,000 tons of pig-iron were made in 1872, but the make had fallen in 1876 to 2,093,236 tons. On the continent the iron manufacture is rapidly extending in France, Belgium, Prussia, Austria, Sweden, and Russia. It is remarkable that as much as 250,000 tons of steel were made in 1875 both in Germany and France by the Bessemer and other processes, a large quantity being also made in other countries. Notwithstanding the activity of the iron-trade abroad, the produce of Great Britain is still about one-half that of all other countries put together.

Siemens's regenerative gas-furnace is now so much used in the making and melting of steel, as well as for other purposes, that it is desirable to give a short description of it here. No furnace yet designed can be compared with it in respect to economical consumption of fuel. It consists of two parts: one of these contains the "regenerators," or, as Dr. Percy calls them, the "accumulators;" the other, which may either be quite near or more than 100 ft. apart, contains the "gas-producers" or source of the heat. In the regenerative portion, when the furnace is to be used for the production of iron or steel, there is a melting hearth or bed like that represented at B in fig. 3. Immediately below this hearth there are two pairs of arched chambers filled with fire-bricks placed sufficiently far apart to let air or gases pass freely between them, and at the same time expose a large surface to absorb heat. One pair of these chambers or regenerators communicates by separate flues with one end of the hearth, the other pair with the opposite end of it. Thus we have in duplicate, so to speak, a chamber through which gas and another through which air can be admitted. The furnace being in operation; while the gas and air are being admitted to the hearth through, say, the left pair of these chambers, the highly-heated products of combustion pass through the open brick-work of the corresponding pair on the right before reaching the chimney. What would pass up the chimney as waste heat in an ordinary furnace is thus absorbed by the bricks of the regenerators. After a given time—usually from 30 to 60 minutes—by means of suitable pipes and valves, the arrangement, or if we may so call it, the current, is reversed. Gas and air are now sent through the freshly-heated pair of regenerators, while the "waste heat" in turn passes into the other pair. In this way, by reversing the valves at intervals, hot currents of gas and air, in suitable proportions, are always reaching the hearth where combustion is effected at a very high temperature.

The gas-producer, of which there are commonly four in a block, is a rectangular chamber with a sloping front and grate of firebars, on which, by means of a feeder, a thick layer of fuel is maintained. This fuel is mainly converted into carbonic oxide, hydrogen, and hydrocarbons—all combustible gases—and together forming the "gas" we have referred to in describing the regenerator. Almost any kind of fuel, however poor, may be used for these gas-producers, which are connected by means of a pipe with the generators.

3. *Iron in its Physiological and Therapeutic Relations.*—Iron is an essential constituent of the coloring matter of the blood-corpuscles of all vertebrate animals; and according to the best authorities, one part by weight of iron is found in 230 parts of blood-corpuscles, and the total quantity of this metal in the blood of a man weighing 140 pounds is about 38 grains. It is the presence of iron in the blood that communicates to the ashes of that fluid their reddish-brown color, the iron being found in them, as the peroxide. The ashes of the hair, of birds' feathers, of the contents of eggs, of the gastric juice, of milk, and indeed of most animal fluids contain traces of this metal.

Nothing is known with certainty regarding the chemical condition of the iron in the animal body, that is to say, whether it is present as a protoxide, a peroxide, etc. It is introduced into the system with the food and drink, and any excess beyond what is required is discharged with the excrements. When an insufficient quantity is contained in the nutriment, chalybeate medicines become necessary. The iron that is set free within the system by the constant disintegration of blood-corpuscles is carried out of the system partly by the urine, partly by the coloring matter of the bile, which is highly ferruginous, and probably is in part eliminated by the hair. The exact part which the iron plays in the body is uncertain; but it is most probable that the power which the blood-corpuscles possess as oxygen carriers is mainly due to the presence of this substance.

When from any cause the blood-corpuscles are reduced in number, the state known as *anaemia* (q.v.) is produced, which is accompanied by general weakness and deranged functions. In this condition of the system the iron compounds are of incomparably more service than any other remedies. In chlorosis (q.v.), which is closely allied to anaemia, in amenorrhœa; and in certain painful nervous affections, the salts of iron are of especial service. The forms in which iron may be prescribed are very numerous, and vary considerably in their utility, according to the readiness with which they get taken up into the blood. Amongst the most generally used ferruginous medicines may be mentioned the tincture of the sesquichloride, the saccharine carbonate, the compound iron mixture (containing the carbonate), the sulphate, the potassio-tartrate, several citrates (especially the citrate of iron and quinine), etc. A course of chalybeate waters (q.v.) may often be prescribed with great advantage, when the patient cannot bear the administration of iron in its ordinary medicinal form.

IRON (ante). The processes of converting the ore into metallic iron are of two kinds—direct and indirect. In the direct process the ore is converted by one operation or a few operations into wrought iron. This method, employed by the ancients, is still used in some parts of the world, as in India and Central Asia, Africa, and South America. With some modifications and improvements it is practiced also in Europe and the United States, and yields the best iron, but at a greater expense than by the indirect process, which consists in first making pig-iron by smelting the ore in a blast-furnace with fluxes, by which means the metal is more readily obtained, and then reducing the product by puddling and other processes, or by certain manipulations converting the pig-iron into cast-steel.

The following table, taken with the preceding from the annual report of the secretary of the American Iron and Steel Association, presented May 20, 1880, shows in tons of 2,000 lbs. the production of all kinds of iron and steel in the United States from 1872 to 1879:

IRON, a co. in s.e. Missouri; bounded n.e. by Iron mountain and Pilot Knob; 500 sq.m.; pop. '70, 6,278. It is mountainous, and has extensive forests of oak, pine, walnut, etc. Iron ore is abundant, and gold, lead, nickel, and other metals are found. The staple products are grain and wool. The St. Louis and Iron Mountain railroad passes through it. Pilot Knob is in this county, a conical hill 1500 ft. above the sea, and 560 ft. above the plain.

IRON, a co. in s. Utah, extending through the state from e. to w.; intersected in the e. by the Colorado; 9,200 sq.m.; pop. '80, 4,013. The Wasatch mountains cross it in the west. The staple is wool; but wheat, maize, hay, and potatoes are produced. Much of this county is covered with arid plains, and requires irrigation. It abounds in iron and other minerals. Capital, Parowan.

IRON BARK TREE, a name given in Australia to certain species of *eucalyptus* (q.v.), and particularly *E. resinifera*, on account of the extreme hardness of the bark. These trees attain a height of 80 or 100 ft., and a circumference near the base of 20 to 25 feet. The timber is very valuable for ship-building, and for other purposes in which hardness and durability are required. It withstands vicissitudes of weather for a great number of years without injury.

IRON-CLAD OATH, an oath of allegiance prescribed by statute of the United States, for those taking office under the national or state governments, in accordance with the provisions of the 14th amendment to the constitution. The oath as administered reads as follows:

"I, _____, residing at _____, do solemnly swear that I have never voluntarily borne arms against the United States since I have been a citizen thereof; that I have voluntarily given no aid, countenance, counsel, or encouragement to persons engaged in armed hostility thereto; that I have neither sought, nor accepted, nor attempted to exercise the functions of any office whatever under any authority or pretended authority in hostility to the United States; that I have not yielded a voluntary support to any pretended government, authority, power, or constitution within the United States, hostile or inimical thereto. And I do further swear that, to the best of my knowledge and ability, I will support and defend the constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I take this obligation freely, without any mental reservation or purpose of evasion; and that I will well and faithfully discharge the duties of the office on which I am about to enter. So help me God."

Sworn to before me, this — day of —, 188—. }

U. S. Commissioner.

This oath is still administered to officers under the U. S. government, but its application has been restricted by special acts of congress, relieving, in certain instances, classes and individuals from the effect of its provisions.

IRON-CLAD SHIPS. See ARMOR PLATES, *ante*.

IRON CROSS, a Prussian order of knighthood, instituted on Mar. 10, 1813, by Fredrick William III., and conferred for distinguished services in the war which was then being carried on. The decoration is an iron cross with silver mounting. The grand cross, a cross of double the size, was presented exclusively for the gaining of a decisive battle, or the capture or brave defense of a fortress.

IRON CROWN, the crown of the ancient Longobardian kings, given, according to an unauthenticated tradition, by pope Gregory the great to queen Theodolinda, and preserved till lately in the cathedral of Monza. Henry, in 1311, is the first German emperor who is known to have worn it. It was removed by the Austrians to Vienna after 1859, but was presented to the king of Italy in 1866. The outer part of the crown consists of a golden hoop, with enameled flowers and precious stones, in form like an ancient diadem, within which is a thin plate or fillet of iron, which is declared by a tradition long opposed by the church at Milan, but adopted by the congregation “*dei sacri riti*” at Rome, to have been hammered from one of the nails of the true cross. When Napoleon I. was elected king of Italy in 1805, he took this relic and crowned himself with it, disdaining to receive it from the hands of a bishop; and at the same time he founded an order of knighthood, taking its name from the iron crown. The order—forgotten after the fall of Napoleon—was restored and remodeled in 1816 by the emperor Francis I., who gave it the name of the Austrian order of the iron crown.

IRON MASK, THE MAN WITH THE. The story of the prisoner so called, confined in the Bastile and other prisons in the reign of Louis XIV., has long kept up a romantic interest. The first notice of him was given in a work entitled *Mémoires Secrets pour servir à l’Histoire de Perse* (Amst. 1745–46). According to this writer, he was the duke of Vermandois, a natural son of Louis XIV. and De la Vallière, who, having given a box on the ear to his half-brother, the grand dauphin, had to expiate it with imprisonment for life. The assertion was without foundation, for the duke of Vermandois died in camp in 1683; but the confidence with which it was made caused a deep sensation, and the romance of Mouhy, *L’Homme au Masque de Fer*, which immediately followed (Hague, 1746), was read with all the more avidity that it was prohibited. Voltaire, in his *Siecle de Louis XIV.*, treats the anecdote historically. According to him, the prisoner was young, and of a noble figure. In journeying from one prison to another, he wore a mask, and was at last transferred to the Bastile, where he was treated with great distinction; and so on.

The first authentic information with regard to the iron mask was given by the Jesuit Griffet, who acted for nine years as confessor in the Bastile, in his *Traité des différentes Sortes de Preuves qui servent à établir la Vérité dans l’Histoire* (Liège, 1769). He brought forward the MS. journal of Dujonca, the lieut. of the Bastile, according to which Saint-Mars arrived, on Sept. 18, 1698, from the isle de Sainte-Marguerite, bringing with him in a litter a prisoner whom he had already had in custody at Pignerol. The prisoner's name was not mentioned, and his face was always kept concealed by a mask of black velvet. The journal mentions his death on Nov. 19, 1703, and that he was buried in the cemetery of St. Paul. This is confirmed by the register of burials for the parish of St. Paul's, where the prisoner is mentioned under the name of Marchiali.

After long silence Voltaire returned to the subject in his *Essai sur les Meurs*, but he brought forward nothing new. In the seventh edition of the *Dictionnaire Philosophique* he related the story anew, under the head *Anna*, corrected his errors as to time from the journal of Dujonca, and concluded with the assurance that he knew more about the matter than Griffet, but chose, as a Frenchman, to be silent. An addition to the article, apparently by the editor of the work, freely states the opinion that the mask was an elder brother of Louis XIV. The writer makes Anne of Austria to have had this son by a favorite, and being thus undeceived as to her supposed barrenness, to have brought about a meeting with her husband, and in consequence bore Louis XIV. Louis is held to have first learned the existence of this brother when he came of age, and to have put him in confinement, to guard against any possible unpleasant consequences. Linguet, in the *Bastille Dévoilée* (“The Bastile Exposed”), ascribes this paternity to the duke of Buckingham. Saint-Michel published a book in 1790, in which he relates the story of the unfortunate being, and points to a secret marriage between queen Anne and cardinal Mazarin. What is remarkable is that the court continued to manifest an interest in the matter, and took every means to keep the identity of the prisoner in the dark. When the Bastile fell the prisoner's room was eagerly searched, and also the prison register; but all inquiry was vain. The abbé Soulavie, who published *Mémoires de Maréchal Richelieu* (Lond. and Par. 1790), tries to make out from a document written by the tutor of that unfortunate prince that the iron mask was a twin-brother of Louis XIV. A prophecy had announced disaster to the royal family from a double birth, and to avoid this, Louis XIII. had caused the last born of the twins to be brought up in secret. Louis XIV. learned of his brother's existence only after the death of Mazarin, and that brother having discovered his relation to the king by means of a portrait, was subjected to perpetual imprisonment. This view of the matter was that almost universally prevalent till the time of the revolution. It is also followed in Zschokke's German tragedy, and in Fournier's drama, founded on the story.

The first conjecture of what till recently seemed to be the truth is contained in a letter dated 1770, written by a baron d'Heiss to the *Journal Encyclopédique*. The same is repeated by Louis Dutens in his *Intercepted Correspondence* (1789), who declares that there is no point of history better established than the fact that the prisoner with the iron mask was a minister of the duke of Mantua. This minister, count Matthioli, had pledged himself to Louis XIV. to urge his master the duke to deliver up to the French

the fortress of Casale, which gave access to the whole of Lombardy. Though largely bribed to maintain the French interests he began to betray them; and Louis XIV., having got conclusive proofs of the treachery, contrived to have Matthioli lured to the French frontier, secretly arrested, April 23, 1679, and conveyed to the fortress of Pignerol, which was his first prison. The conclusion of D'Heiss and Dutens, that Matthioli was the iron mask, though acute, was only a conjecture. But the documents since discovered and published by M. Roux-Fazillac in his *Recherches historiques et critiques sur l'Homme au Masque de Fer* (Par. 1800), by M. Delort in his *Histoire de l'Homme au Masque de Fer* (Par. 1825), and M. Marius Topin in his *Man with the Iron Mask* (1869), seemed to leave little doubt on the subject, and the public had apparently made up its mind that the secret was at last discovered; but a still more recent work by a French officer, M. Th. Iung, *La Vérité sur le Masque de Fer (Les Empoisonneurs) d'après des Documents inédits des Archives de la Guerre et autres dépôts publiés, 1664-1703* (Par. 1873), has conclusively shown that Matthioli could not have been the mysterious prisoner, and endeavors to prove—we would almost venture to say, succeeds in proving—that the man in the iron mask was the unknown head of a wide-spread and formidable conspiracy, working in secret for the assassination of Louis XIV. and some of his ablest ministers. The severity of M. Iung's labors with reference to this subject will be understood when it is stated that in the course of his researches he had to examine some 1700 volumes of dispatches and reports in the bureau of the ministry of war.

IRON-MONGERY, a term applied to the small manufactures of iron or hardware kept for general sale in shops.

IRON MOUNTAIN, a famous deposit of iron ore in Washington co., Mo., 40 m. s.w. of St. Genevieve, on the Mississippi, and connected with St. Louis by railroad. The ore is rich and pure. It is magnetic, having distinct polarity, and in some places acts strongly on the needle. The main body of the ore has a thickness of 50 ft.; its depth is unknown, but the amount is immense. In 1871 262,477 tons, and in 1872 371,474 tons were shipped by the Iron Mountain company. The deposit has been fully described by Dr. Litton in the second annual report of the geological survey of Missouri, 1855, and by prof. Raphael Pumpelly and Dr. Adolph Schmidt.

IRONS, otherwise called **BILBOES**, are shackles of iron into which the ankles of a prisoner are fixed, and which slide on a long iron bar. Refractory sailors and soldiers, who evince violent behavior, and become unmanageable, are commonly put in irons, several being placed side by side along the same bar. In cases of extreme violence the wrists may be similarly treated, but instances of this latter punishment are rare. The punishment of "putting in irons" is more common in the navy than in the army.

IRONS, WILLIAM JOSIAH, b. England, 1812; graduated at Oxford; was made prebendary of St. Paul's, London, 1860; and chosen Bampton lecturer, 1870. He is the author of several valuable theological treatises.

IRONTON, a city of Lawrence co., Ohio, on the Ohio river, 142 m. above Cincinnati and 100 s.e. of Columbus; pop. '70, 5,686. It is on a plain at the base of lofty hills, which contain iron ore and bituminous coal. It is the terminus of the Iron railroad, 13 m. long. It has 10 churches, 2 national banks, a high school, 5 weekly newspapers, a large number of furnaces, rolling-mills, iron-foundries, and machine-shops. The chief article of export is iron, the iron trade amounting to \$7,000,000 a year. The city is lighted with gas, and furnished with water by the Holly works.

IRONWOOD, a name bestowed in different countries on the timber of different trees, on account of its great hardness and heaviness.—*Metrosideros vera* belongs to the natural order *myrtaceæ*, and is a native of Java, and other eastern islands. It has ovato-lanceolate, shortly stalked, smooth, sharp-pointed leaves; and axillary, many-flowered, stalked cymes. Its wood is much valued by the Chinese and Japanese for making rudders, etc., and is imported into Britain in small quantities under the name of ironwood. The bark is used in Japan as a remedy for diarrhea and mucous discharges.—*Mesua ferrea*, a tree of the natural order *guttiferae*, is a native of the East Indies, and is planted near Buddhist temples for the sake of its fragrant flowers, with which the images of Buddha are decorated. The flowers resemble small white roses, and contrast singularly with the deep crimson buds and shoots. The timber, known as ironwood, is very hard, as is that of *M. speciosa*, another tree of the same genus and region.—The wood of *reipsis undulata*, of the order *diosmaceæ*, is called white ironwood at the cape of Good Hope. It is very hard and tough, and is chiefly used for axles, plows, and other agricultural implements.—The wood of *olea laurifolia*, a species of olive, is called black ironwood in the same country, and is used for the same purposes, and for furniture.

IRONY (Gr. *eirōneia*, from *eirōn*, a dissembler) is the name given to that peculiar style of thought and expression by which words are made to convey a meaning exactly opposed to their literal sense. When skillfully used irony is one of the most crushing and irresistible figures of rhetoric. Instances will readily occur to every reader of history and literature. One of the most celebrated is that recorded in Scripture, where Elijah taunts the discomfited priests of Baal on Mount Carmel. The great master of irony in ancient times was Socrates, who, as has been happily said, raised it to the dignity of a philosophic method.

IROQUOIS. See INDIANS.

IROQUOIS (*ante*), or SIX NATIONS, a confederacy originally consisting of the five tribes, Mohawks, Oneidas, Onondagas, Cayugas, and Senecas, to whom in 1712 were added the Tuscaroras. The league was then called the Six Nations. They inhabited the central and western part of New York, and numbered about 15,000. Each tribe was divided into families, and governed by sachems, but all matters of common interest were settled in a general meeting of all the sachems of the confederacy. They were the most powerful, enterprising, and intelligent of all the Indian tribes. They encouraged other nations to join them, and in the early part of the 17th c. had conquered all the neighboring tribes. They were alternately at war and in alliance with the Dutch, French, and English. In the war of the revolution they took sides with the English under the brave leaders Brant of the Mohawks and Red Jacket of the Senecas, destroying with fire and sword several white settlements. After the war, treaties were made at different times for the cession of their lands, until, 1796, the Indian title was extinguished to the whole region from lake Champlain to the St. Lawrence, and most of the Iroquois emigrated to other places. The Mohawks settled on Grand river, Ontario, Canada, numbering now 2,000. Some from the Tuscaroras and other tribes joined them. In 1820 some of the Oneidas settled on a reservation in Green Bay, Wis., and some of the Senecas in Indian territory. Some of the Oneidas and Senecas removed in 1820 to Canada. The Cayugas in 1795 sold their lands in New York, and joined other tribes with whom they intermarried, a few living together at the Cattaraugus reservation in Erie, near Buffalo. In 1855 the Iroquois group in New York, Wisconsin, Arkansas, and Missouri numbered about 6,000. The languages of the Iroquois, though in grammar and vocabulary related, are distinct. Most of the Protestant denominations have had missions among the Six Nations from the beginning of the century. *The Book of Common Prayer* has been printed in Mohawk, and portions of the Bible in Mohawk and Seneca. The principal works on the Iroquois published are *Cusick's Sketches of the History of the Six Nations*, 1826; *Colden's History of the Five Nations*, 1727 and 1805; *Schoolcraft's Notes on the Iroquois*, 1826; *Stone's Life of Brant*, 2 vols., and *Life of Red Jacket*, 1841.

IROQUOIS, an eastern co. of Illinois, bordering on Indiana, intersected by the Iroquois river, and partly drained by the Kankakee river; 1100 sq.m.; pop. 70, 25,782. It is traversed by the Chicago division of the Illinois Central, Toledo, Peoria, and Warsaw, and Chicago, Danville, and Vincennes railroads. Capital, Watseka. The surface is level, mostly prairie. The soil is generally fertile. The staple products are oats, maize, hay, cattle, and pork.

IRRATIONAL NUMBERS, a term applied to those roots of numbers which cannot be accurately expressed by a finite number of figures. For instance, $\sqrt{2}$ is an irrational number. If the diameter of a circle is one foot, the circumference is an irrational number. Irrational numbers have been defined to be numbers which are incommensurable with unity. They are also commonly termed surds.

IRRAWA'DI (said to mean, like Mississippi, "father of waters"), the great river of Farther India, is believed to rise in Thibet, near lat. 28° n., and long. 98° e., terminating in lat. $16^{\circ} 20'$ n., and long 96° e. Its course is pretty nearly due s., and has been estimated at 1200 m. in length. After receiving the Ning-thee, the Mogonny, the Bhamo, and the Lungtchuen, it begins to form its delta about 17° n., which, between the Rangoon on the e., and the Bassein on the w., comprises 10,000 sq.m. of forest and pasturage, curiously intersected by an inextricable network of the smaller branches of the stream. With regard to facilities of communication, the Irrawadi appears to be decidedly superior to the Indus and the Ganges, being navigable, even at low water, for vessels of 200 tons, as far as Ava, which is 400 m. from the sea, and for canoes as far as Bhamo, which is 180 m. higher up. The Irrawadi successively traverses China, Burmah, and Pegu. As the region last mentioned, forming the lowest part of its basin, is a province of British India, the Irrawadi, as a whole, may be said to be virtually under the control of England. In both our Burmese wars, it constituted the line of advance for our armies.

IRREDUCIBLE CASE occurs in the solution of cubic equations (q.v.) by Cardan's method when p is negative, and $\frac{p^3}{27}$ greater than $\frac{q^2}{4}$ (abstracting from the sign). These

conditions render $\sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}$ an imaginary quantity, and thus Cardan's formula fails in its application. The difficulty is got over by the aid of trigonometry.

IRREL'EVANT, a term used in Scotch law to denote that what is said or put forward by an opponent in an action has no bearing on the subject, even if it were true. The corresponding term, in English law, is that the pleading containing the irrelevant matter is demurrable.

IRRIGA'TION (Lat. *watering*), a method of producing or increasing fertility in soils by an artificial supply of water, or by inundating them at stated periods. Irrigation was probably first resorted to in countries where much of the land must otherwise have remained barren from drought, as in Egypt, where it was extensively practiced nearly 2,000 years B.C., and where great systems of canals and artificial lakes were formed for

the purpose. Extensive works, intended for the irrigation of large districts, existed in times of remote antiquity in Mesopotamia, Persia, India, China, and some other parts of the east; and in such of these countries as have not entirely lost their ancient prosperity, such works still exist. In many parts of the world the necessity of irrigation, at least at certain seasons of the year, is so strongly felt that the agriculture even of comparatively rude tribes depends on the facility with which it can be accomplished. Some plants also require a very abundant supply of water, and irrigation has become general where their cultivation prevails. This is particularly the case with rice, the principal grain of great part of Asia. Irrigation is supposed to have been introduced into Britain by the Romans, but was very little practiced till the beginning of the present century. In Europe, irrigation prevails chiefly in the s., where it was extensively practiced by the Romans, from whom it was adopted by the Lombards; and it is most extensively practiced in Lombardy, and in some parts of Spain, and in the s. of France, so that the great plains and valleys of the Po, Adige, Tagus, Douro, and other rivers, are almost entirely subjected to a systematic irrigation, which prodigiously increases their fertility. The extent of irrigated land in the valley of the Po is estimated at 1,600,000 acres, and the increase of rental thus caused at £830,000.

Irrigation in Britain, and in most parts of Europe, except Lombardy, is almost exclusively employed for the purpose of increasing the produce of grass by converting the land into water-meadows. The value of it, even for this one purpose, does not seem to be sufficiently understood. Poor heaths have been converted into luxuriant meadows by means of irrigation alone. But in the countries in which irrigation is most extensively practiced the production of all crops depends on it.

The irrigation of land with the sewage water of towns is, under another name, the application of liquid manure. In no small degree the water of rivers and of springs depends on its organic and mineral constituents for its fertilizing properties, so that the application of it is not in principle different from that of liquid manure; but it must be borne in mind that the mere abundance of water itself is of great importance for many of the most valuable plants, as the most nutritious substances brought into contact with their roots are of no use to them unless in a state of solution; whilst it is an additional recommendation of irrigation, that the supply of water most favorable to the growth of many valuable plants, is destructive of some which in many places naturally encumber the soil, as heath, broom, etc. The water which is used for irrigation should be free from mud and such impurities as mechanically clog the pores of leaves, or cover up the *hearts* of plants, and interfere with their growth. Irrigation is far from being so extensively practiced in Great Britain as seems desirable. The extent of water-meadows in England is stated to be not more than 100,000 acres. They are mostly confined to the w. and s. of England. Individual farms, irrigated with sewage water, are to be met with in Nottinghamshire, Staffordshire, Lancashire, Cheshire, and in one or two counties in Wales. The most successful instance, however, of sewage irrigation in Great Britain is to be found near Edinburgh, where an extensive tract of meadows, lying between Portobello and Leith, yields a rent of £20 to £40 an acre; the grass is cut from 3 to 5 times a year, and as much as 10 tons an acre have been obtained at a cutting. See SEWAGE, MANURE.

The method of forming and laying out water-meadows will be easily gathered from the following sketch of the different species of irrigation as practiced in this country.

1. *Bed-work Irrigation*.—This method can only be conveniently applied to ground which is nearly level. It consists in laying out the ground into sloping beds or ridges, from 30 to 40 ft. wide, according to the nature of the soil, having their upper ends lying in a gentle slope from one side to the other of the meadow. Along the upper ends of the beds is drawn the drain or *conductor*, which brings the water from the reservoir or river, as the case may be; and this conductor must be tapered off towards its further end, in order that the diminished supply of water may still overflow. From this conductor, small drains, called *feeders*, are led down along the crown of each ridge. In the lowest part of the meadow, a main-drain, which must be made nearly as large as the conductor, is cut across the lower ends of the beds, and the water, after having served the purpose of irrigation, is led into it by means of small drains cut in the furrows. The feeders should, like the conductor, taper towards their further extremity, both for the purpose of retarding the velocity of the water, and of preserving a continual overflow along their whole length. On the contrary, the small drains should gradually widen towards their lower extremity, where they meet the main-drain. The dimensions and inclination of the conductor and feeders should be so regulated to the water-supply, that the beds can be wholly laid under water to the depth of about one inch. The expense of bed-work irrigation ranges from £20 to £40 per acre.

2. *Catch-work Irrigation* differs materially from the former; it can be applied to land whether level or not, costs only £4 per acre, and, in the opinion of many, is quite as effective. The conductor formed as before is led along the highest side of the field, then with the aid of a level, a succession of perfectly level gutters (which, of course, must be winding) are drawn across the field in the same direction as the conductor, and not more than ten yards from each other; these are crossed by feeders running from the conductor to the lowest side of the field, thus forming a kind of checkwork. The main-drain is made as before, and the feeders, which taper towards their lower extremity, serve for small drains. This plan is more effective than the former, when the supply of

water is limited; and as it can be applied to a hillside as well as to a level field, its application is rapidly extending.

3. *Subterraneous Irrigation* is only applicable to perfectly level fields, and consists, first, of ditches being formed all round the sides. At right angles to these, drains or conduits are drawn across the field in parallel lines. When the land is to be irrigated, water is let into the ditches, and thence to the cross-drains, till it rises to the level of the surface; and when the ground is to be laid dry, the side-ditches are emptied by sluices. The bottom of the ditches is below the level of that of the cross-drains, so that they serve both as conductor and main-drain.

The first two methods of irrigation are only applied to pasture-lands, and the third to fens and drained morasses, which are apt to become parched in summer; the last method would be very valuable for land under green crop in cases of drought.

The management of water-meadows requires great skill and care, but we can only here mention the chief points to be attended to, which are these: the water, if limited in quantity, must be confined to a part which it can effectually irrigate; too much water or too rapid a flow tends to wash away the soil; the meadow may be kept under water for a fortnight at a time, in Nov., but the time should be diminished till April or May, when regular watering should cease; after the grass is cut or eaten down, the water may be let on for a few days; and it is necessary that between the times of watering the land should be laid perfectly dry. Special precautions are necessary in winter, to guard against any bad effects resulting from frost, etc.

IRRIGATION (ante). Some of the ancient works for irrigation were stupendous. The canal of the Pharaohs, which connected Pelusium with the Red sea, was an irrigating canal. There existed a work in Arabia, probably long before the time of Solomon, which, in some respects, excelled all works of the kind, modern or ancient, and corresponds well with the fact that the Arabians were among the first mathematicians. In Yemen, Arabia, there was an immense reservoir for holding water for irrigating the valley of Mareb. This reservoir was made by a dam 2 m. long and 120 ft. high. It was constructed of immense blocks of ashlar, and was so durable as to serve the purpose for which it was built more than 2,000 years. It then gave way, scattering ruin in the course of the torrent which it let loose. It must be borne in mind that one of the best examples of modern engineering is a dam in France across the Furens which is 164 ft. high, but only 328 ft. wide at the top. This work almost sinks into insignificance when compared to the ancient Arabian dam. It may, perhaps, be presumed that there is some exaggeration in the statement regarding the ancient work, but a reasonable allowance must leave it as one of the most stupendous engineering works of which we have any record. The plains of Assyria and Babylonia were intersected with a system of canals both for irrigation and navigation. In many of them the water was raised by mechanical means somewhat like that practiced at present in Egypt. The ancient Peruvians and Mexicans constructed immense aqueducts for irrigation purposes. The system of irrigation practiced in Lombardy at the present time, and derived from the ancient Romans, is the cause of the wonderful fertility of that country. The distribution of the waters of all the rivers of Lombardy is held by the government, and is rented for periods of time to the horticulturists and agriculturists. Channels are made for leading the water from the rivers, and from these secondary channels are constructed, about 24 ft. apart. In summer the water is allowed to flow only a few hours during each week, but from Oct. to April the flow is steadily kept up, except during grass-cutting. The lands thus irrigated well repay their owners for the outlay by the increased rent received, which is about one-third more, while the yield is double. The cultivation of rice can be successfully carried on only with irrigation, and the best lands are therefore found on the alluvial flats bordering rivers. The land is intersected by ditches, along which there are embankments supplied with gates, so that the water in the ditches may be raised above the level of the fields, and flowed upon them at pleasure. The rice is planted in trenches and lightly covered, and then the water is let on and kept there for from 4 to 6 days, or when the grains swell and begin to sprout. It is then let off till the sprouts are 2 or 3 in. above the ground, when it is let on again for about the same space of time. Then it is drained off, and after a time the rice is cultivated with a hoe. In from 6 to 8 weeks the water is again let on for 2 weeks, for the first 4 days to a considerable depth, after which it is gradually let off. See RICE. Considerable attention is paid to irrigation in our western territories and California. The facilities are usually great, as elevated mountain streams may generally be used as sources, whence the water finds its way by gravity wherever it is directed.

IRRITABILITY in plants, a term employed to designate phenomena very interesting and curious, but than which none connected with vegetable life are more imperfectly understood. Such are the phenomena of what is usually called the *sleep* (q.v.) of plants; the motion of the spores (q.v.) of many cryptogamic plants by means of cilia; the motions of *oscillatoriae*, *diatomaceæ*, and others of the lowest *algæ*; the successive approaches of the stamens of *Parnassia palustris* to the pistil; the movements of the leaves of the *moving plant* (q.v.) of India; and those caused by agitation or by the touch of a foreign body in the leaves of *sensitive plants* (q.v.) of the *dionæa* or Venus's fly-trap, etc., in the stamens of the barberry, *schizanthus*, etc., and in the stigmas of *mimulus*,

etc. Many explanations have been proposed of these phenomena, but none satisfactory. Of the existence of anything analogous to the nervous system of animals, which has been imagined, there is not the slightest proof, closely as some of the phenomena resemble those of animal life. The explanations which have been proposed are no better than mere guesses. See MUSCLES.

IRRITANCY (Lat. *irritus*, of no effect), a term in Scotch law to denote something in the nature of neglect or injury which destroys or makes void an existing right; in English law it is called forfeiture. Thus, there is the irritancy of a feu-right from non-payment of the duty for two years.—**IRRITANT CLAUSE**, in a Scotch entail, is a clause which makes void certain prohibited acts of the heir of entail, such as selling the property.

IRRITANTS. Those medicines which when applied to the skin or mucous membranes produce irritation are commonly called irritants. The term has been sometimes vaguely applied to medicines which produce irritation of nerves in distant parts when taken internally, as instanced in the action of strychnine upon the spinal cord, but such use is confusing; the better term to apply to strychnine is that of nervous stimulant. In one sense, however, irritants are nervous stimulants, because they act upon the nerves, and when these are paralyzed or divided the irritants lose their power. There is diversity in the action of irritants. Most mineral or miner-acid irritants cause disorganization, as corrosive sublimate, nitrate of silver, caustic potash and soda, also sulphuric, nitric, hydrochloric acids; but these agents are called also caustics. It would perhaps be more proper to apply the term irritant to such substances as create irritation without acting chemically, although disorganization or death of the parts might follow their continued application. The imponderable agents are irritants. Heat is an irritant, and may be considered as a mechanical or kinetic irritant. Light is also an irritant to the retina, and in diseases of the eye is often a powerful one. Electricity is an irritant when applied in certain forms, but may be used as a mild stimulant, just as heat may be employed to disorganize and to excite excessively, or to irritate or to gently stimulate.

IRRIGATION is the term applied to any morbid excitement of the vital actions not amounting to inflammation; and it is often, but not always, a cause of that condition.

In cases of irritation, remarkable sympathetic symptoms are often observed. Thus, irritation of a calculus occasions intense sickness and vomiting. But of all sources of sympathetic morbid affections of this class, irritation of the stomach and intestines is at once the most common and the most important. The ordinary sick headache is the most frequent form of this sympathetic affection; but in certain morbid conditions, and especially in the puerperal state, the symptoms may be such as pretty closely to resemble those of acute inflammation of the peritoneum, the heart, the pleura, or the membranes of the brain. It is to Dr. Marshall Hall that the credit is mainly due of pointing out those cases in which irritation so closely resembles inflammation. He has shown that blood-letting affords a certain means of diagnosis in these cases. In true inflammation, 30 or 40 oz. of blood may be taken before there are any symptoms of faintness; while in irritation, the loss of a very few ounces (9 or 10) of blood will cause the most decided syncope.

IRISH', a river of Siberia, an affluent of the Obi (q.v.).

IRVINE, a royal and parliamentary burgh, seaport, and market t. of the co. of Ayr, Scotland, is situated on both banks, but principally on an eminence on the right bank of the river Irvine, which is here crossed by a handsome stone bridge, about a mile above the embouchure of the river in the firth of Clyde. It is 11 m. n. of Ayr, and 29 m. s.w. of Glasgow by railway. The harbor has now become so much sanded up, as only to admit vessels of about 100 tons burden. The "academy" is one of the most flourishing educational institutions in the w. of Scotland. Ship-building, and the manufacture of book-muslins, jaconets, and checks, are among the branches of industry. Formerly, many women were employed in sewing muslins. The shipping trade for vessels under 100 tons burden is considerable. Irvine unites with Ayr, Campbeltown, Oban, and Inveraray, in sending a member to parliament. Pop. '71, 6,866.

IRVINE, WILLIAM; 1742-1804; b. Ireland; d. Philadelphia. He graduated at the Dublin university, was surgeon of an English ship of war in the English and French war, at the close of which, 1763, he emigrated to America, settling at Carlisle, Penn. In the revolution he joined the colonies, and was appointed by congress colonel of the 6th Pennsylvanian regiment. At the battle of Three Rivers, Canada, he was made prisoner, but exchanged May, 1778. He was made brig.gen. May 12, 1779. In 1781-83 he had command at fort Pitt of the troops for the defense of the western frontier, and 1785 was appointed for the state an agent to examine the public lands and devise a mode for their distribution to the soldiers. In 1787 he was made a member of the old congress, and of the convention to revise the constitution of Pennsylvania. In 1794 he was member of congress, and was appointed to the command of the troops to suppress the "whisky rebellion." He was president of the society of the Cincinnati.

IRVING, Rev. EDWARD, was b. in the town of Annan, Dumfriesshire, Aug. 15, 1792; studied at the university of Edinburgh, and, after completing his curriculum for the min-

istry, became assistant (in 1819) to Dr. Chalmers, then a minister in Glasgow. His sermons did not prove very popular. Chalmers himself was not satisfied. In 1822 Irving received a call to the Caledonian church, Hatton garden, London, which he accepted. His success as a preacher in the metropolis was such as had never previously been witnessed. After some years, however, the world of fashion got tired of Irving; but it was not till his more striking singularities of opinion were developed that fashion finally deserted him. At the close of 1825 he began to announce his convictions in regard to the second personal advent of the Lord Jesus, in which he had become a firm believer, and which he declared to be near at hand. This was followed up by the translation of a Spanish work, *The Coming of the Messiah in Majesty and Glory*, by Juan Josafat Ben Ezra, which professed to be written by a Christian Jew, but was, in reality, the composition of a Spanish Jesuit. Irving's introductory preface is regarded as one of his most remarkable literary performances. In 1828 appeared his *Homilies on the Sacraments*. He now began to elaborate his views of the incarnation of Christ, asserting with great emphasis the doctrine of his oneness with us in all the attributes of humanity. The language which he held on this subject drew upon him the accusation of heresy; he was charged with maintaining the sinfulness of Christ's nature, but he paid little heed to the alarm thus created. He was now deep in the study of the prophecies; and when the news came to London in the early part of 1830, of certain extraordinary manifestations of prophetic power in the w. of Scotland (see IRVINGITES), Irving was prepared to believe them. Harassed, worn, baffled in his most sacred desires for the regeneration of the great Babylon in which he dwelt, branded by the religious public, and satirized by the press, the great preacher, who strove above all things to be faithful to what seemed to him the truth of God, grasped at the new wonder with a passionate earnestness. Matters soon came to a crisis. Irving was arraigned before the presbytery of London in 1830, and convicted of heresy; ejected from his new church in Regent's square in 1832; and finally deposed in 1833 by the presbytery of Annan, which had licensed him. His defense of himself on this last occasion was one of his most splendid and sublime efforts of oratory. The majority of his congregation adhered to him, and gradually a new form of Christianity was developed, commonly known as Irvingism, though Irving had really very little to do with its development. Shortly after his health failed, and in obedience, as he believed, to the Spirit of God, he went down to Scotland, where he sank a victim to consumption. He died at Glasgow, Dec. 8, 1834, in the 42d year of his age.—See Carlyle's *Miscellaneous Essays*, and Mrs. Oliphant's *Life of Edward Irving* (London, 1862).

IRVING, PETER, 1771-1838; b. N. Y., brother of Washington. He studied but did not practice medicine. In 1802 he was editor and proprietor of the *Morning Chronicle*, a Democratic journal which advocated the election of Aaron Burr to the presidency. He was associated with his brother in the publication of *Knickerbocker's History of New York*. He resided in Europe, 1809-36.

IRVING, THEODORE, LL.D.; b. N. Y., 1809; graduated at Columbia college, 1837; visited Europe, 1828; and in Madrid, Paris, and London attended lectures and studied literature. He studied law in London and New York. In 1836-49 he was professor of history and belles-lettres in Geneva college, N. Y., and subsequently for 3 years was professor of belles-lettres in the Free academy of New York. In 1854 he was ordained a minister of the Episcopal church; became rector of St. Andrew's parish, Richmond, Staten island, and, 1874, rector of St. John's school for young ladies in New York. He published *The Conquest of Florida by De Soto*, and *The Fountain of Living Waters*, a devotional work.

IRVING, WASHINGTON, a distinguished American author, was b. in the city of New York, April 3, 1783. He was the youngest son of William Irving, who had emigrated from Scotland, and settled in New York as a merchant before the revolution. Washington Irving at the age of 16 entered a law office; but he profited largely by his father's well-stocked library, Chaucer and Spenser being his favorite authors. New York, at this period, was a small town of about 50,000 inhabitants, many of whom were descendants of the original Dutch settlers, having quaint manners and customs, of which Irving was a curious observer. In 1804, with the excuse of a tendency to pulmonary disease, he visited, and traveled extensively in Europe; returned to New York in 1807, and contributed a series of genial and humorous essays to a periodical called *Salmagundi*. In 1809 he wrote *A History of New York, from the beginning of the World to the end of the Dutch Dynasty*, by Diedrick Knickerbocker, a burlesque chronicle, written in so quiet a vein of humor that it has sometimes been taken for a veritable history.

Having no inclination for law, he engaged in commerce with his brothers as a silent partner, but devoted his time to literature, and in 1813 edited the *Analectic Magazine*, in Philadelphia. At the close of the war in 1815 he visited England, where he was warmly welcomed by Campbell, whose biography he had formerly written, and was introduced by him to Walter Scott. While he was enjoying his English visit his commercial house failed, and he was suddenly reduced to poverty, and the necessity of writing for his bread. The *Sketch-book*, portions of which had appeared in New York, was offered to Murray, and afterwards to Constable, but was refused by both of these celebrated publishers. After an unsuccessful attempt of the author to publish it on his own account, Murray, on Scott's recommendation, took the *Sketch-book*, paying £200 for the copyright,

which he afterwards increased to £400. It had a charm in its beauty and freshness, and was a surprise as the work of an American, and was therefore received with great favor. Irving went to Paris, and in 1822 wrote *Braebridge Hall*, and in 1824 the *Tales of a Traveler*. He was then invited by Everett, the American ambassador to Spain, to accompany him to Madrid, to translate documents connected with the life of Columbus. With these materials he wrote his *History of the Life and Voyages of Columbus* (1828); *Voyages of the Companions of Columbus*; *The Conquest of Granada*; *The Alhambra* (1832), a portion of which was written in the ancient palace of the Moorish kings; *Legends of the Conquest of Spain* (1835); and *Mahomet and his Successors* (1849). In 1829 Irving returned to England as secretary to the American legation. In 1831 he received the honorary degree of LL.D. from the university of Oxford; and next year returned to America, where he was received with great enthusiasm. A visit to the Rocky mountains produced his *Tour on the Prairies*. He also contributed sketches of Abbotsford and Newstead abbey to the *Crayon Miscellany*, and from the papers of John Jacob Astor wrote *Astoria* (1837), and the *Adventures of Captain Bonneville*; also a series of stories and essays in the *Knickerbocker Magazine*, collected under the title of *Wolfer's Roost*. In 1842 he was appointed minister to Spain. In 1846 was published his *Life of Goldsmith*; and his great work, the *Life of Washington*, was published in 1855-59. An edition of his works in 15 vols. reached a sale of 250,000 vols. He spent the last years of his life at Sunnyside, in his own "Sleepy Hollow," on the banks of the Hudson, near Tarrytown, with his nieces, where he died suddenly of disease of the heart, Nov. 28, 1859. He was never married.

IRVING, WILLIAM, 1766-1821; b. N. Y., brother of Washington. He was an Indian trader on the Mohawk river, 1787-91; and in 1793 a merchant in New York. In that year he married a sister of James K. Paulding, and was associated with him and Washington Irving in the publication of *Salmagundi*, contributing to it most of the poetical articles. He was a member of congress 1813-19, but resigned on account of ill health.

IRVINGITES, the common but improper designation of a body of Christians who object to any designation which implies sectarianism, and therefore use no other name than the *Catholic Apostolic Church*. In the winter of 1829-30, the rev. Edward Irving (q.v.), then a minister of the Scotch church, Regent square, London, delivered a series of lectures on spiritual gifts, in which he maintained that those which we are in the habit of calling "extraordinary" or "miraculous" were not meant to be confined to the primitive church, but to be continued through the whole period of the present dispensation. About the same time, as if to confirm the views of the great preacher, there occurred at Port-Glasgow, in the w. of Scotland, certain strange phenomena. It was alleged that miraculous acts of healing had happened, and that the gift of tongues had reappeared. After what seemed to be a sufficient investigation on the part of some of the members of Mr. Irving's church, it was concluded that the manifestations were genuine. Similar manifestations shortly after occurred in his own church, which were also pronounced to be genuine. They were held to be of two kinds: 1st, speaking in tongues, and 2d, prophesying. As the former bore no resemblance to any language with which men were conversant, it was believed to be strictly an "unknown tongue," the Holy Ghost "using the tongue of man in a manner which neither his own intellect could dictate, nor that of any other man comprehend." The latter, "prophesying," consisted chiefly of "exhortations to holiness, interpretations of Scripture, openings of prophecy, and explanations of symbols." After some time, Irving was deposed from his office for heresy by the church of Scotland, but meanwhile the religious opinions with which his name is associated had been assuming a more definite and ecclesiastical shape. The final result was the *Apostolic Catholic Church*, the constitution of which is briefly as follows:

There are, as in the apostolic times, *four* ministries: 1st, that of "apostle;" 2d, that of "prophet;" 3d, that of "evangelist;" and 4th, that of "pastor." The apostles are invested with spiritual prerogatives; they alone can minister the Holy Ghost by the laying on of hands; to them the mysteries of God are revealed and unfolded to the church; and they decide on matters of order and discipline. Nothing that transpires in any church in the way of "prophetic utterance" can be authoritatively explained save by them; and the various "angels of the churches" are bound to bring all such utterances under their cognizance, in order that they may be rightly interpreted. The function of the "prophet" has been already indicated. The work of an "evangelist" mainly consists in endeavoring to "bring in" those who are without. The "angel" of the Catholic Apostolic church corresponds with the bishop of other Christian denominations. The ministers of each full congregation comprise an angel, with a fourfold ministry (consisting of elders, prophets, evangelists, and pastors), and a ministry of deacons to take charge of temporal matters. This ministry is supported by tithes, the people giving a tenth of their income for the support of the priesthood. Church affairs are managed by a council of ministers of all classes, whose selection and arrangement are conceived to have been foreshadowed in the structure of the Mosaic tabernacle.

The Catholic Apostolic church does not differ from other Christian bodies in regard to the common doctrines of the Christian religion; it only accepts, in what it considers to be a fuller and more real sense, the *phenomena* of Christian life. It believes that the wonder, mystery, and miracle of the apostolic times, were not accidental, but are essential to the divinely instituted church of God, and its main function is to prepare a people

for the second advent of Christ. A very special feature of the Catholic Apostolic church is its extensive and elaborate symbolism. In regard to the sacrament of the Lord's Supper, the doctrine of the objective presence is held, but both transubstantiation and consubstantiation are repudiated.

The Catholic Apostolic church has established itself in England, Scotland, Canada, the United States, Prussia, France, Switzerland, Ireland, Belgium, Russia, Denmark, Sweden, Australia, and India.

IRWIN, a co. in s. Georgia, bounded n.e. by the Ocmulgee, and intersected by the Allapaha; 850 sq.m.; pop. '80, 2,696. It is level and sandy, and extensively covered with pine forests. It produces some oats and maize. Capital, Irwinville.

IRWIN, JARED, 1751-1818; b. Mecklenburg co., N. C; at an early age removed with his parents to Georgia. In the revolution he was active against the tories and the Indians. After the war he was chosen to the state legislature, was a member of the convention which adopted the constitution in 1789, president of the state constitutional convention of 1798, president for many years of the senate, and governor of Georgia, 1790-98 and 1806-9. Removing to Pennsylvania, he was member of congress from that state, 1813-17.

ISAAC ("he will laugh"), a Hebrew patriarch and pastoral chief, was the son of Abraham and Sarah, and half-brother of Ishmael. His birth happened when both his parents were advanced in age. The incidents of his life, as recorded in Genesis, are well known. He died at Hebron, aged 180 years, leaving two sons, Jacob and Esau.—Isaac's character has always been very differently interpreted. What has been called by some his mild and gentle disposition, simple pastoral piety, others have termed weakness and want of character. His (for the most part) blameless ways, however, call forth our love and esteem. The Midrash ascribes to him, in allusion to Gen. xxiv. 63, the institution of the afternoon prayer.

ISAAC (*ante*) was distinguished for obedience to his father, combined with resignation to the will of God. These traits of character were conspicuous in his quiet submission to being bound upon the altar. This event has had various explanations, and its account has been viewed in different lights. It has been denied that it was a divine voice which called for the sacrifice. The usual view, however, holds to the obvious meaning of the narrative. Among different explanations in this view, may be noted the following, which reads this history in the light which the completed Scriptures throw backward upon it. It was needful that Abraham, as the father of the faithful, should exercise such trust in God as would make him, in that day of darkness and idolatry, the founder of a godly line and an example to believers even in distant times. It was therefore requisite that he should have his knowledge of God's plans increased in order that it might furnish a foundation for great and conspicuous faith. This was done chiefly by means of the land in which he sojourned, and of Isaac his son. The promise that the land should be given to his descendants was one of the first stones of the foundation on which his faith was built; to this was added the assurance that a son should be born to him in his old age. When, 25 years after his entrance into Canaan, this second promise was fulfilled, the living son, the heir of the promises, became the means of a great increase to Abraham's knowledge, and confirmation of his faith. He was taught not only that Isaac represented the Messiah, the Divine deliverer, who was to descend from him, but also that the Messiah by offering up himself unto death would make atonement for the sins of men. Therefore his offering of Isaac was demanded, and made actual through all its stages to the moment when his life was on the point of being taken; and was then completed by the substitution of the victim which Abraham was directed to slay instead of his son. Thus Isaac manifested a Christlike obedience and submission even unto death; while the actual death inflicted on the other victim represented the completion of the sacrifice to which his greater son would deliver himself up. Abraham's own experience also was made representative of God's great sacrifice in salvation. He went through all the anguish that a father's heart could experience in inflicting death on a beloved son without actually striking the final blow, and even this he had so fully intended to strike, and had come so near striking it, that he must have passed through almost all the bitterness of which his soul was capable. Thus was he taught, as fully as possible before the event, the feelings of Christ and of the Father which have since been indicated by the Scripture words, "Father, if it be possible, let this cup pass from me;" "My God, why hast thou forsaken me;" "God spared not his own Son, but delivered him up for us all." In this way also Abraham was brought to exercise faith concerning the resurrection of the dead, as completely as was possible before the actual resurrection of Christ; so that the New Testament says of Abraham that he offered up his son on whom the promises rested, "accounting that God was able to raise him up even from the dead; whence also he received him in a figure. It is probable that no single view likely to be reached by modern thought solves all the mystery or presents all the Divine truth involved in this scene from a remote antiquity."

Isaac's love for his wife, prominent in the scriptural record, is obscured by only one act, in which evidently he was betrayed into cowardly selfishness in persuading his wife to deny the conjugal relationship between them, because, as he afterwards acknowledged, he said, "Lest I die for her." Yet this great fault of his life is hardly to be regarded

as a *bétrayal* of a real character which had been habitually concealed, but rather as an exceptional overwhelming of his better nature by the power of ungovernable fear. In this respect he may have resembled his father, who sinned twice in the same way, yet not in accordance with his usual character, but in glaring contrast to it. In his youth Isaac was thoughtful, in manhood increasingly reflective, and through all his life prayerful and devout. In his treatment of his children he was unwisely partial; and as, while he preferred one son, Rebecca favored the other, it is probable that they both promoted that alienation between the brothers which afterwards so unhappily increased. In disposition he was peaceful and forbearing, preferring to suffer wrong rather than contend violently for his rights. In business relations he was upright; in agriculture he was successful, and became exceeding rich in servants, flocks, and herds. In old age he was disquieted with bodily infirmity and domestic grief. He died full of days, and is one of those concerning whom the certain revelation has been put on record that he has a place in the kingdom of heaven.

ISAAC I., COMNENUS, Emperor of Constantinople, was the first of the family of the Comneni who attained to that dignity. His father Manuel, his brother John, and himself were employed in important military and civil capacities by Basil II. (976-1025); but during the reign of the latter's imbecile and tyrannical successors, in whose eyes it was criminal for any one to excel in wisdom and ability, Isaac was exposed to considerable danger. Such, however, was his prudence, and the affection of the people for him, that the emperors unwillingly suffered him to live unmolested; and on the deposition of Michael VI. (1056-1057), Isaac was elevated to the vacant throne. On his accession he found the affairs of the empire in what was by this time their normal condition; rebellion within, aggression without, and the treasury exhausted. He succeeded in establishing a system of great economy in all branches of the administration, and in order still further to lighten the taxes on the people, called upon the clergy to contribute their share. But the clergy, then as now, refused to endure the imposition of any such burdens, and the patriarch Michael is reported to have even threatened him with deposition. But death delivered Isaac of this formidable opponent, and the clergy were compelled to submit. In 1059 he repelled the Hungarians, who had encroached upon his possessions in the n.w.; but soon afterwards, to the great grief of his subjects, he was attacked by a violent fever, and believing his dissolution approaching, appointed his famous general, Constantine Ducas, as his successor. He, however, recovered from his illness, but resigning the crown, retired to a convent, where he lived for two years in the odor of sanctity, and died in 1061. He was one of the most virtuous emperors of the east, and to great learning, wisdom, and prudence, united an administrative ability and energy, that would, had his reign been of longer duration, have gone far to regenerate the effete Byzantine empire. Nor was he deficient in literary attainments. We still possess by him *Scholia*—hitherto unedited—on Homer, his favorite author; further, a work, *Characteristics*, scil., of the Greek and Trojan chiefs mentioned in the *Iliad*; and finally, a treatise *On the Works of Homer*.

ISAAC II., ANGELUS; 1154-1204; a Byzantine emperor. Delivered by a popular revolution from death, to which he had been condemned by his kinsman, Andronicus Comnenus, emperor of Constantinople, he obtained the throne, 1185. His vices and incapacity rendered him unpopular, and he was dethroned by his brother, Alexis III., 1195, and deprived of his sight, but restored by the crusaders who took Constantinople, 1203. He was again dethroned by Alexis Ducas, and put to death.

ISAAC, LEVITA, a distinguished Jewish rabbi, b. at Wetzlar, Germany, 1515. He joined the Roman Catholic church with his son, 1546. He was professor of Hebrew and Chaldee at Louvain, and in 1551 at Cologne. He was the author of several learned grammatical works, and also translations. His name after his conversion was John Isaac Levi. The date of his death is unknown.

ISABELLA, a central co. of Michigan, intersected by the Chippewa river; 576 sq.m.; pop. '70, 4,113. The surface is generally level, and largely covered with forests of pine and sugar-maple. Productions: wheat, oats, maize, hay, and potatoes. The Flint and Père Marquette railroad passes through the n.e. part. Capital, Mt. Pleasant.

ISABELLA of Castile, queen of Spain, b. on April 23, 1451, was the daughter of John II., king of Castile and Leon, and in 1469 married Ferdinand V., surnamed "the Catholic," king of Aragon. On the death of her brother, Henry IV., in 1481, she ascended the throne of Castile and Leon, to the exclusion of her elder sister Joanna. She had won the support of great part of the states of the kingdom during her brother's life, and the victorious arms of her husband compelled the consent of the rest (see FERDINAND). Isabella was a woman of remarkable energy and talent, and possessed no inconsiderable beauty and much winning grace, although proud, ambitious, and deficient in true womanly gentleness. She was always present in meetings of council, and insisted on the use of her name along with that of Ferdinand in all public documents. She died at Medina del Campo, on Nov. 26, 1504, after having exacted from her husband, of whom she was always jealous, a promise, confirmed by oath, never to marry again.

ISABELLA II. (MARIA ISABEL LUISA), ex-queen of Spain, the elder daughter of Ferdinand VII. by his fourth wife, Maria Christina, of the Two Sicilies, was b. at Madrid, Oct. 10, 1830, and by a decree which set aside the Salic law in Spain, and was confirmed by the cortes, Mar. 29, 1830, became the heiress-apparent to the throne, which she ascended on the death of her father in Sept., 1833, her mother being appointed queen-regent. An insurrection in favor of her uncle, Don Carlos (q.v.), who, according to the Salic law, would have succeeded to the throne, immediately broke out in the north-eastern provinces, and raged with great violence for seven years, but was ultimately suppressed by the aid of Britain, France, and Portugal. During this tumultuous epoch, effective internal administration was impossible, and it was necessary to conciliate as far as possible all parties, in order to prevent desertions to the Carlists. Before the revolt had been crushed, which was conclusively effected in 1839, politicians had begun to divide into two classes, the *moderados*, or "conservatives," and the *exaltados*, or "liberals;" and though the queen-regent sided with the former party, she found it necessary to enlarge the liberal constitution of 1834, and ultimately (1837) to re-establish the constitution of 1812. The attempts of the moderados to inaugurate a more narrow policy in 1839 failed, and Maria Christina was forced to flee to France, leaving the regency and the care of the young queen to Espartero (q.v.). On Nov. 8, 1843, the queen was declared by the cortes to have attained her majority; and this was followed soon after by the return of the queen-mother, the military dictatorship of Narvaez, and an anti-liberal policy. The question known as the "Spanish Marriages," which at that time agitated the different courts of Europe, was settled by French influence, the queen marrying her cousin, Don Francisco d'Assisi, eldest son of Ferdinand VII.'s youngest brother (Oct. 10, 1846); while her sister, Maria Ferdinand Luisa, espoused the Duke of Montpensier, the fifth son of Louis Philippe. This marriage of the queen, based wholly upon the political interests of the party in power, has been fruitful of domestic annoyances, estrangements and reconciliations rapidly succeeding each other. After eight years of authority, during which he had repressed all liberalism with an iron hand, and foiled the intrigues both of the Carlists and the king-consort, Narvaez gave place to Murillo (Jan., 1851), who began by promising liberal reforms, and agreed to a concordat with the pope. A change to almost purely absolute government in 1853, was followed by the banishment of many chiefs of the constitutional party, and a formidable rising of the army took place. The queen-mother fled to France, and Espartero was once more put at the head of an administration in which liberal principles held sway. But the queen disapproving of his policy, he resigned in favor of O'Donnell, July 14, 1856, who was soon after supplanted by Narvaez; and the latter, in turn, had (Oct., 1857) to make way for a liberal government. In July, 1858, O'Donnell was restored to power, and with the exception of a brief interval in June, 1865, in which Narvaez was president of the council, maintained himself in the premiership till his death, Nov., 1867. The chief foreign events of Isabella's reign were—repeated negotiations of the United States with Spain, with the view of purchasing the island of Cuba; the rectification of the Pyrenean frontier; the successful war with Morocco (q.v.); the annexation and subsequent evacuation of St. Domingo (see HAYTI); and the discreditable squabbles with the republics of Chili and Peru. The nation became more and more impatient under the despotic rule of the last years of Isabella's reign; and at length, in Sept., 1868, a revolution broke out, which ended in the formation of a republican provisional government, and the flight of Isabella to France. In 1870 she renounced her claim to the throne in favor of her son, Alfonso (chosen king in 1874). She returned to Spain in 1878.

ISABELLA THE CATHOLIC, ORDER OF, a Spanish order of knighthood, founded by Ferdinand VII., in 1815, as a reward of loyalty, and for the defense of the possessions of Spanish America. It is now conferred for all kinds of merit. The sovereign is the head of the order, which is divided into the three classes of grand crosses, commanders, and knights.

ISABELLA OF ENGLAND. See EDWARD II. and III., *ante*.

ISABEY, JEAN BAPTISTE, 1767-1855; b. France. He was a pupil of the celebrated painter David, and began his profession by making crayon portraits, but devoted most of his life to miniature-painting, in which he became very eminent. His picture of Napoleon, 1802, reviewing his troops, gained for him great renown, and he became the emperor's miniature-painter. The members of the imperial family, the marshals and other dignitaries of the empire, sat to him, and he was invited to visit Alexander of Russia. His *Tableaux des Maréchaux* and the *Conference of Vienna* are fine large historical paintings.

ISÆUS, b. probably at Chalcis, though claimed by Athens. The dates of his birth and death are unknown, though it is certain that he became eminent as an orator the last half of the 4th c. b.c. He was the son of Diagoras. In his youth he was at one time dissipated and extravagant, but afterwards reformed. He went when young to Athens, studied oratory under Lysias and Isocrates, and taught with success a school of rhetoric of which Demosthenes was a pupil. He was the fifth in order of the 10 Attic orators, and is mentioned by Plutarch, in his *Lives of the Ten Orators*, as the author of 64 orations. Only 11 are extant. They are all forensic, and treat mostly of subjects relating to disputed wills. His style, though elegant and vigorous, lacks the perspicuity

and simplicity of his master Lysias. An English translation by sir William Jones was published in London in 1794, with a commentary and notes critical and historical.

ISAIAH (Heb. *Yeshayahu*, "Salvation of God"), the most sublime of the Hebrew prophets, was the son of one Amoz. He uttered his oracles in the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. Regarding his outward life, almost nothing is known. He appears to have resided at Jerusalem, in the vicinity of the temple, was married, and had three sons, given him, he says, "for signs and for wonders in Israel." The period of his death is not known, but according to a rabbinical legend, apparently accepted by the writer of the Epistle to the Hebrews (xi. 37), (Sanh. 103 b, etc.), he was sawn asunder by order of king Manasseh, who abhorred his oracles (cf. Jos. Ant. x. 31). If this statement is well founded, Isaiah must have been nearly 100 years old when he was thus barbarously murdered.—The prophecies of Isaiah, viewed in their literary aspect, do not exhibit a continuous unity of design; they consist of a series of "visions" beheld at different times, and arranged neither exactly in chronological nor material order. The compiler or editor of the whole is believed by many not to be Isaiah himself. Verse 38th of chap. xxxvii. is regarded by the majority of scholars of note as conclusive proof of a later hand. The grand controversy, however, is not concerning the arrangement of these prophecies, but concerning their authorship. Did they all proceed from one and the same person, or are different authors discernible? Orthodox critics maintain the unity of authorship, and assert that Isaiah, if he did not edit, certainly wrote the whole 66 chapters. The first who doubted this was the German scholar Koppe (1779-81), who suspected that the last 27 chapters (40 to 66) were the work of a later hand. He was followed by Döderlein, Eichhorn, and Justi, and the same view has been substantially adopted by Paulus, Bertholdt, De Wette, Gesenius, Hitzig, Knobel, Umbreit, and Ewald. The chief arguments against the Isaiah-authorship are: 1. That the subject-matter of these burdens relates to what happened long after Isaiah's death, 100 years at least, viz., the redemption of the Jews from captivity, consequent upon the overthrow of the Babylonian monarchy by the Medo-Persian army. 2. That the writer speaks of the exile as something present, and of the desolation of Judah as a thing that had already taken place. 3. That Cyrus is mentioned by name, and an intimate knowledge exhibited of his career. 4. That an extraordinarily minute acquaintance with the condition and habits of the exiles is shown. 5. That the sentiments are far more spiritual. 6. That the style is totally different, being more smooth, flowing, rhetorical, and clear. To these objections, Hengstenberg, Hävernick, Keil, Henderson, Jahn, Möller, Alexander, and others have replied more or less satisfactorily. Their principal argument is the predictive character of prophecy. In these prophecies, we have the first distinct and vivid announcements of a Messianic deliverer (whence Isaiah has been called the "Evangelical prophet"). As, however, they are found chiefly in the last 27 chapters (the supposed work of a deutero-Isaiah), it has been made a question, by those who do not believe in prophecy in the usual sense, whether the "deliverer," who redeems the people by his own sufferings, is a literal prediction of Jesus Christ on the part of the prophet, or only a personification of the sanguine hope of deliverance that animates his patriotic and religious soul.

The style of Isaiah possesses an astonishing richness and variety. It reaches the pinnacle of grandeur, and melts into the softest pathos. Ewald, a master of aesthetic as well as of philologic criticism, attributes to him "the most profound prophetic excitement and the purest sentiment, the most indefatigable and successful practical activity amidst all perplexities and changes of outward life, and that facility and beauty in representing thought which is the prerogative of the genuine poet. . . . In the sentiments which he expresses, in the topics of his discourses, and in the manner of expression, Isaiah uniformly reveals himself as the kingly prophet" (*Propheten des Alten Bundes*, vol. i. p. 166, etc.). Among the chief commentators on Isaiah are Jerome, Aben-Ezra, Abarbanel, Vitrunga, Lowth, Henderson, Calmet, Hitzig, Rosenmüller, Gesenius, Hengstenberg, and Alexander.

ISAIAH, PROPHECY OF (ante). The reasons alleged by some critics, within this century, for denying that Isaiah wrote the last 27 chapters of the book called by his name are: 1. As, according to a tradition mentioned in the Talmud, the order in which the three great prophets were arranged was originally Jeremiah, Ezekiel, and Isaiah, it is to be inferred that Isaiah was placed last because of a suspicion which somewhere existed that the latter part had been written after Ezekiel. To this it is answered that the inference would not be warranted even if the alleged order of arrangement were certain; but that it is not certain or probable is shown by a witness earlier than the Talmud, that is, the author of *Ecclesiasticus*, who refers to the three prophets in the order in which they now stand—Isaiah, Jeremiah, and Ezekiel. 2. The writings of the prophets who lived after Isaiah, and before the captivity, do not show an acquaintance with the second part of the prophecy. To this it is answered: (1) that the fact would not prove the non-existence of the second part when these prophets wrote; and (2) that in fact, as will hereafter be more fully shown, Jeremiah and other prophets of the time specified, do quote this second part (yet the objector insists that, on the contrary, it contains quotations from them). 3. The last part differs from the first in style and religious views. To this, other critics reply that no differences exist which are inconsistent with unity of authorship;

that the first part contains the germs of the principal things exhibited in the second; and that the style of the latter part greatly resembles that of the former, although it naturally rises in fulness and sublimity as the scope of the prophecy is enlarged. 4. Isaiah lived more than a century before the captivity in Babylon, and did not once foretell it; but as the author of the second part narrated so fully the special condition of the Jews at that time, and the general oriental relations, even calling Cyrus by name, he must have been an eye-witness of what he described. The answers to this are: (1) This reasoning, which is simply the assumption that absolute prediction is impossible, will appear without force to those who take notice that the prophet ascribes all the predictions which he records to God as their author, who claims the prerogative of foretelling the future, and exercises it in regard to Cyrus, Babylon, and the Jews, for the express purpose of revealing himself to those who did not know him. (2) If the reason alleged proved that the second part of the prophecy was written after, or at, the captivity, it would equally prove that it was written after, or at, the coming and crucifixion of Jesus Christ; for these events are described in it as clearly as is the deliverance of the Jews by Cyrus. (3) In the first part of the prophecy Isaiah does foretell the captivity in Babylon. In chapter i. he promises a restoration and redemption which admit of a primary reference to the return from captivity; in vi. he speaks of a time when the cities of Judah would be wasted without inhabitant, the houses be without man, the land be desolate, and the men be removed far away; xxxix., he tells Hezekiah: "Behold, the days come, that all that is in thy house, and that which thy fathers have laid up in store until this day, shall be carried to Babylon: nothing shall be left;" xiii., xiv., he foretells that the Lord would stir up the Medes against Babylon, would set Israel in their own land, and that in the day of their deliverance they should say concerning Babylon: "How hath the oppressor ceased, the golden city ceased!"

PROOFS THAT THE LAST 27 CHAPTERS WERE WRITTEN BY ISAIAH.—I. *External*.—1. There is evidence that several of the prophets who wrote before the Jewish captivity were familiar with this part of Isaiah, alluded to it and quoted it. While the full force of this evidence can be felt only after a careful comparison of many passages in the original language, part of it can be at once appreciated. Isaiah iii. 1, 7 says: "There shall no more come into thee the uncircumcised and the unclean. How beautiful upon the mountains are the feet of him that bringeth good tidings, that publisheth peace;" and Nahum, who wrote about 660 B.C., says: "Behold upon the mountains the feet of him that bringeth good tidings, that publisheth peace. O Judah, the wicked shall no more pass through thee." Isaiah xlvi. 8 says to Babylon: "Thou that art given to pleasures, that dwellest carelessly; that sayest in thine heart, I am, and none else beside me;" and Zephaniah, about 625 B.C., applies the same language to Nineveh: "This is the rejoicing city that dwelt carelessly, that said in her heart, I am, and there is none beside me." An examination of the contexts will show, it is believed, that Isaiah is the earlier writer from whom the others quote. Consequently it is plain that the latter part of his prophecy existed long before the captivity. 2. The book of Ezra and the second book of Chronicles give the decree of Cyrus liberating the Jews, in which he says: "All the kingdoms of the earth hath the Lord God of heaven given me, and he hath charged me to build him a house in Jerusalem." On the supposition that Daniel and other Jews had at Babylon the book of Isaiah containing these last chapters, the action of Cyrus, on being made acquainted with their declarations concerning himself, was simply that which an intelligent and upright man would naturally feel stirred up to perform. But on the supposition that the book contained only the first 39 chapters, then for the great historical facts of the return of the Jews to their own land, of the grant to them of royal treasures for rebuilding their temple, and of the conqueror's official acknowledgment of obligation to God, whom he had not known, no sufficient reason is assigned. 3. The book of Isaiah as it stands in the Hebrew canon has 66 chapters. If it had, at first, contained only 39, an addition of 27 chapters of any sort, and especially of the 27 now forming the latter part, could not have been made to it, at any subsequent time, without some record, or proof, or intimation remaining concerning the agent, author, process, or time. But in this case nothing of the kind has ever been seen or heard of. 4. The book of Ecclesiasticus, written in Hebrew after 300 B.C., in eulogizing the succession of Scripture characters, speaks of Isaiah as "the prophet who was great and faithful in his vision; in his time the sun went backward, and he lengthened the king's life. He saw by an excellent spirit what should come to pass at the last, and he comforted them that mourned in Zion. He showed what should come to pass forever, and secret things ere ever they came." This description, affirming Isaiah's prophetical eminence in Hezekiah's time, speaks chiefly of things contained in the last 27 chapters, and links them firmly with the first part, characterizing the xl. and lxi. when it says: "he comforted them that mourned in Zion;" the xlii. when it speaks of "showing secret things ere ever they came;" and the close of the book, when it points to things that "should come to pass forever." This short passage, therefore, shows that the writer of Ecclesiasticus had the book of Isaiah in its integrity as we have it now. 5. In the Septuagint translation of the Old Testament, made about 250 B.C., the book of Isaiah consists of 66 chapters. At that time, therefore, the whole book must have been in circulation as it is now. 6. When the Savior went into the synagogue at Nazareth there was delivered to him "the book of the prophet Esaias," and, having opened it, he found the place where it

was written: "The Spirit of the Lord is upon me, because he hath anointed me to preach the gospel to the poor." This passage is part of the lxi. chapter. When the treasurer of Candace was returning from Jerusalem he read in his chariot Esaias the prophet; and the passage that he asked Philip to expound—"He was led as a sheep to the slaughter"—is in the liii. chapter. Paul, in Romans, affirms "Esaias saith, 'Lord, who hath believed our report?'" This also is part of the liii. chapter. Again he declares: "Esaias is very bold, and saith, 'I was found of them that sought me not. . . . All day long I have stretched out my hands to a disobedient and gainsaying people.' This is in the lxv. chapter. From the New Testament, therefore, it is plain that the book of Isaiah at the time of Christ contained these 27 chapters as it contains them now.

II. Internal.—Two items only of the internal proof that Isaiah was the author of the whole book can here be given. 1. The first chapter is an introduction, not merely to the first part, but to the whole book, and in its closing verses bears a marked resemblance to the last 27 chapters. After its condemnation of Judah and Jerusalem for their sins, it promises a future purification and redemption, and ends with declaring that incorrigible sinners shall be destroyed. "Zion shall be redeemed with judgment, and her converts with righteousness. And the destruction of the transgressors and of the sinners shall be together." The last 27 chapters contain three sections, of 9 chapters each, all promising a future salvation, and all ending with declaring the destruction of the wicked. The first section, referring primarily to deliverance from captivity and idolatry, says: "Go ye forth of Babylon, utter it to the end of the earth, say ye: The Lord hath redeemed his servant Jacob. . . . There is no peace, saith the Lord, to the wicked." The second section, referring especially to a spiritual salvation, says: "Peace, peace to him that is far off, and to him that is near, saith the Lord; and I will heal him. . . . There is no peace, saith my God, to the wicked." The third section promises the new heavens and the new earth, which are to continue forever, and intensifies the declaration of destruction to the wicked. And as the introduction, in the first chapter, closes with declaring that the mighty sinner and his work "shall both burn together, and none shall quench them," so the whole book closes with the dreadful sentence: "Their worm shall not die, neither shall their fire be quenched; and they shall be an abhorring unto all flesh." 2. Through the book of Isaiah—the first part and the last—there is a series of prophecies concerning the Messiah which demonstrates the unity of the whole. Some of these are the following: in chap. ii. the prediction springs at once to the last days, when the mountain of the Lord's house shall be established in the top of the mountains, and men shall learn war no more; in chap. vii. it promises the birth of a virgin's son, who should be named Immanuel, as a sign of the son of Mary; in the ix. it glorifies the way of the sea, beyond Jordan, Galilee of the nations, and proclaims joyful tidings concerning the child that should be born, one of whose names would be the mighty God, and whose government and peace should increase forever; in the xi. it declares that a rod should come forth out of the stem of Jesse, on whom the Spirit of the Lord should rest; in the xxxii. it announces that there should come a man as a hiding-place from the wind, and a covert from the tempest; in the xxxv. it affirms that the wilderness and the solitary place should be glad, and the ransomed of the Lord return and come to Zion with songs and everlasting joy upon their heads; and in the last 27 chapters it expands all these promises, beginning with the voice of the forerunner in the wilderness, revealing the glory of the suffering Messiah, and foretelling the new heavens and the new earth.

ANALYSIS.—The book contains two prophetic parts with intervening chapters in which history and prophecy are closely combined. *Part I.* contains 35 chapters. Chapter i. is introductory, as has been said, to the whole book; ii.—iv. announce the Messiah's kingdom and judgments on transgressors; v. pronounces condemnation on Israel and Judah under the emblem of a cherished vineyard that yields only evil fruit; vi. records the prophet's vision of the glory of the Lord, and foretells a mingling of judgments and mercy; vii. promises a child, as a sign from the Lord, whose birth would soon be followed by the desolation of the land of the two hostile kings; viii. denounces judgments on Israel and Judah under the emblem of the prophet's son whose name signifies, "Hasten the spoil, rush on the prey;" ix. foretells the birth and the divine nature of the Messiah; x. describes the advancement and defeat of the Assyrians; xi., xii., portray the blessings of the Messiah's kingdom; xiii.—xxiii. contain a series of "burdens," to be borne by Babylon, Philistia, Moab, Damascus and Israel, Ethiopia, Egypt, Assyria and Israel, Egypt and Ethiopia, the desert of the sea, Dumah and Arabia, Jerusalem and Shebna, and Tyre; xxiv.—xxvi. announce judgments and sorrow on account of sin, followed by the blessings and joy of salvation; xxvii. represents the punishment of Assyria and Egypt under the emblems of the Leviathan and the dragon of the sea; xxviii.—xxx. proclaim judgments on Israel and Jerusalem mingled with mercies; xxxi. promises the Messiah under various emblems; xxxii., xxxiv., foretell judgments on the nations, mingled with mercy to the people of God; xxxv. closes the first part with a glorious prediction of the Messiah. *Intermediate chapters* (xxxvi.—xxxix.) in which history is combined with prophecies that were fulfilled immediately, except that, in mercy to Hezekiah, the captivity threatened was deferred. *Part II.*, consisting of 27 chapters, and comprising prophecies concerning the whole work of redemption from the rebuilding of Jerusalem to the new creation, is subdivided into three

sections of 9 chapters each. *Section 1* (chapters xl.-xlviii.), in which both the Messiah and Cyrus are promised as deliverers, with the latter, as first to come, emphatically named and described in the central place. *Section 2* (xlix.-lvii.), promising the Messiah alone, assigns his sufferings, death, and consequent glory the central place. *Section 3* (lviii.-lxvi.), exhibiting the glory only of the Messiah, gives the central place to Zion as the bride.

ISAMBERT, FRANÇOIS ANDRÉ, 1792-1857; b. France. He distinguished himself greatly at the bar by his defense of the free colored people of the French West Indies. He assisted in forming the French geographical society, and the society for the abolition of slavery. He was a voluminous writer. Among his works were a *Manual for the Publicist and Statesman*; *The Religious Condition of France and Europe*; *A History of Justinian*; *History of the Origin of Christianity*; a translation of the works of Josephus and of the *Ecclesiastical History* of Eusebius, besides numerous articles contributed to periodicals.

ISANTI, a co. of Minnesota, intersected by the St. Francis or Rum river; 490 sq m.; pop. '75, 3,901. The surface is diversified with forests and lakes. The soil is fertile, producing wheat, oats, maize, grass, and potatoes. Capital, Cambridge.

ISAR, or Iser, a river of Germany, rises in the Tyrol, to the n. of Innsbruck, and, entering Bavaria, flows generally in a n. and n.e. direction, and joins the Danube at Deggendorf, after a course of about 180 miles. Munich and Landshut are situated upon its banks. In the first part of its course, it is an impetuous mountain torrent; and even after it leaves the Alps it has many rapids and islands, but for a great part of its course it is navigable for boats. Much wood is floated down the Isar from the mountains.

ISAURIA, a tract of country in Asia Minor on the n. side of Mt. Taurus between Phrygia, Lycaonia, Cilicia, and Pisidia. The Isaurians were a wild and half barbarous people, living by plunder and rapine, and greatly annoyed the Roman and Byzantine rulers. They have displayed an indomitable spirit from the earliest times. When opposed by superior numbers they fled to their mountain fastnesses. They were equally formidable at sea, and with their Cilician neighbors ravaged the eastern seas with their piracies. In 78 B.C. they were reduced to a temporary submission by the Romans, but soon renewed their raids, keeping their neighbors in constant alarm. The Romans endeavored to surround their country with a chain of fortresses. In the 3d c. they formed one nation with the Cilicians, and one of their number proclaimed himself Roman emperor, but was put to death. In the 8th c. two of their number, Zeno and Leo III., obtained the throne of the eastern empire. The capital, Isaura, at the foot of Mt. Taurus, the only important city, was a large, rich, and well-fortified place. It was burned, together with its inhabitants, by the Isaurians when unable to withstand the siege of Perdiccas. The country was rocky and barren, producing chiefly the vine, which was cultivated with care.

ISCHIA (the ancient *Aenaria*), an island situated between the bay of Naples and that of Gaeta. It is about 37 sq.m. in extent, and has a population of 28,000 inhabitants. Ischia is a favorite place of summer resort, and is noted for the excellence of its mineral waters and numerous springs, the great richness of its soil, the exquisite flavor of its fruits and wines, and the enchanting character of its scenery. Its highest point is the volcanic Monte Epomeo, 2,574 ft. above the level of the sea, of which the eruptions have been numerous and disastrous; that of 1302 was of two months' duration, and occasioned a serious loss of life and property. The lake of Ischia appears to occupy an extinct crater of the volcano, and abounds in fish.

ISCHL, a small t. of upper Austria, surrounded on all sides by gardens, is finely situated on the river Traun, amid magnificent alpine scenery, 28 m. e.s.e. of Salzburg. It is the chief town of the district called the Salzkammergut (q.v.). The situation of Ischl, and the salt baths, which were established here in 1822, have attracted to it vast numbers of visitors. The emperor and many of the Austrian nobility have built villas here, and the town has also acquired celebrity from having been the scene of various diplomatic conferences. Pop. '69, 6,842. Much salt is manufactured here.

ISE'0, LAKE, or LACUS SEVINUS, a lake of northern Italy, situated between the provinces of Bergamo and Brescia. Its extreme length from n. to s. is about 20 m.; its average breadth, 6 m.; and its greatest depth, 984 feet. On its banks is situated the town of Iseo. The lake is fed by the rivers Oglio and Borlazzo. The surrounding scenery is highly interesting, broken into picturesque heights, and studded with fine villas, vineyards, and olive-gardens.

ISÈRE, a river of the s.e. of France, rises in Savoy, at the western base of Mt. Iseran, flows in a general s.w. direction through Savoy, and through the departments of Isere and Drome, and joins the Rhone 8 m. above Valence. Its entire length is about 190 m., for the last 50 of which it is navigable, but not without difficulty, as its channel is interrupted by shoals and islands.

ISÈRE, a department in the s.e. of France, is bounded on the n. and w. by the river Rhone, on the e. by the department of Savoie, and on the s. and s.e. by those of Drome and Hautes-Alpes. Arca, 3,200 sq.m., of which nearly a half is in arable land, and a

fifth in wood. Pop. '76, 581,099. The surface is level in the n.w., but becomes mountainous as one proceeds s., where the scenery is very imposing. Mt. Olau, on the south-eastern border, is 12,664 ft. high. The chief rivers, besides the Rhone, are the Isère, from which the department derives its name, and its affluents the Drac and Romanche. The department of Isère is one of the richest of France in mineral productions. Mines of iron, lead, copper, and coal are worked, and gold and silver occur. The vine is carefully cultivated in the valleys; 5,324,000 gallons of wine are said to be produced annually. Arrondissements, Grenoble, La Tour du-Pin, St. Marcellin, and Vienne; capital, Grenoble.

ISERLOHN', an important manufacturing t. of Prussian Westphalia, is situated in a picturesque and mountainous district, on the Baar, a tributary of the Ruhr, 18 m. w. of Arnsberg. The industry of Iserlohn is chiefly directed to the manufacture of hardware of various kinds, especially of brass and bronze articles. Pop. '75, 16,868.

ISERNIA (anc. *Aesernia*, a city of the Samnites), a t. of Italy, in the province of Campobasso, is situated in a commanding position on the crest of a hill, 24 m. w. of Campobasso, and is surrounded by scenery of romantic beauty. The modern town consists chiefly of one long and narrow street, and is surrounded by walls. Among numerous other antiquities is a subterranean aqueduct, hewn in the solid rock, which still supplies the fountains and manufactories with water, and remains unimpaired throughout its entire course of one mile. Isernia was much injured by an earthquake in 1805, when some of its finest buildings were ruined. Woolens, paper, and earthenware are here manufactured. Pop. 8,584.

ISHIM, a river of Siberia, an affluent of the Obi (q.v.).

ISHMAEL (Heb. *Yishmael*, "God will hear"), the first-born of Abraham, by Hagar, the Egyptian handmaid of his wife Sarah. His character is found foretold before his birth by an angel, who met Hagar sitting by a well in the wilderness on the way to Shur, whither she had fled to avoid the harsh treatment of her mistress: "And he will be a wild [literally, "a wild ass-"] man; his hand against every man, and every man's hand against him; and he shall dwell in the presence of all his brethren" (Gen. xvi. 12). Expelled from his father's house, along with his mother, when he was about the age of 15, he went into the southern wilderness, where he grew up to manhood, and became famous as an archer. Scripture represents Ishmael in a not unfavorable light, and it was predicted that he should become a great nation. This "great nation" is commonly believed to be the Arabian; and there is no good reason for doubting that at least the northern Arabs—the wild Bedouins who roam over the great wastes between the peninsula of Sinai and the Persian gulf—may, to a certain degree, be the descendants of Ishmael. There is, however, not a shadow of reason, as all scholars now admit, for the notion that the founders of the great Joktanite and Cushite monarchies in the s. of Arabia were of Ishmaelite origin; and the description given in Scripture of the character and habits of Ishmael and his descendants does not in the least apply to these monarchies. The Bedouins of northern and central Arabia, on the other hand, are full of Ishmaelite traditions. Mohammed asserted his descent from Ishmael, and the Mohammedan doctors declare that Ishmael, and not Isaac, was offered up in sacrifice—transferring the scene of this act from Moriah in Palestine to Mt. Arafát near Mecca.

I'SIAC TABLE, a monument much esteemed and quoted by archaeologists previous to the discovery of hieroglyphics, being a flat rectangular bronze-plate, inlaid with niello and silver, about 4 ft. 8 in. long, by 3 ft. in height. It was sold by a soldier of the constable de Bourbon to a locksmith, and bought of the same by cardinal Bembo in 1527, passed after his death to Modena, and finally to Turin, where it is now deposited. It consists of three rows of figures of Egyptian deities and emblems. Its object was supposed to have been votive, or even to have been the nativity of the emperor Trajan; but it is now recognized as a very late or spurious monument.—Winckelmann, Op. iii. 113, v. 450; Wilkinson, sir G., *Mann. and Cust.*

ISIDORE OF CHARAX, b. at Charax on the Tigris; was a geographer, living in the 1st c. A.D. He wrote a work describing the Romans, Greeks, and Parthians, extracts from which are found in Pliny, and fragments published in modern times give much information concerning Asiatic geography.

ISIDORE OF SEVILLE (*ISIDORUS. HISPALENSIS*), one of the most distinguished ecclesiastics of the 6th century. He is particularly remarkable as among the earliest representatives of the church of Spain, and of that great movement in the western church by which the doctrinal and moral system of Christianity was brought into harmony with the habits and institutions of those various races and nationalities which, by successive immigrations and wars, were eventually erected into the Hispano-Gothic kingdom, which exercised so powerful an influence on what is called Latin Christianity. He was born about 560 or 570, at Carthagena, where his father, Severianus, was prefect. Two of his brothers, Fulgentius and Leander, were, like himself, bishops, the first of Carthagena, the second succeeding himself in the see of Seville. The episcopate of Isidore is rendered notable by the two half-ecclesiastical, half-civil councils of Toledo in 619 and in 633, which were held under his presidency, and the canons of which may almost be said to have formed the basis of the constitutional law of the Spanish

kingdoms, both for church and for state, down to the great constitutional changes of the 15th century. He also collected with the same object all the decrees of councils and other church laws anterior to his time. His death, which occurred in 636, forms one of the most remarkable scenes in early Christian history. When he became sensible of the approach of death, he summoned his flock to his bedside, exhorted them to mutual forbearance and charity, prayed their forgiveness for all his own shortcomings in his duty, and directed all his property to be distributed among the poor. His works, which are in the most various departments of knowledge—theological, ascetical, liturgical, scriptural, historical, philosophical, and even philological—were first published in 1580; but the most complete edition is that of Arevali, 7 vols. 4to (Rome, 1797-1803). We are indebted to Isidore for many fragments of Greek and Latin authors, among the number several of whom hardly any other remains have been preserved.

ISIDORIAN DECRETALS, also called **FALSE DECRETALS**, a spurious compilation of the 9th c., which, by a singular combination of circumstances, obtained currency in the western church, and continued for several centuries to enjoy unquestioned authority. Up to the 9th c., the only authentic collection of decretals, that of Dionysius Exiguus, commenced with the decrees of pope Siricius in the end of the 4th century. The so-called Isidorian decretals stretch back through the predecessors of Siricius up to Clement himself, and comprise no fewer than 59 decrees or epistles anterior to the time of Siricius. In a later part of the Isidorian collection, moreover, are interpolated nearly 40 similar documents, unknown till the time of that compilation. All these documents are presented not merely as authentic, but as the genuine productions of the particular popes to whom they are attributed. The subject-matter of these decretals is most diversified, comprising the authority and privileges of the pope, the whole system of the hierarchy, with the relations of its several orders to each other and to the common head. In all, there is a strong and systematic assumption of the papal supremacy; but it is at the same time more than doubtful whether the direct object of the author was the exaltation of the papal prerogative. It is much more likely that the object was to protect the rights of bishops against the arbitrary rule of the metropolitans. Dean Milman thinks it probable that the author believed that he "was not asserting for Rome any prerogative which Rome herself had not claimed" (*Latin Christianity*, ii. 378). Catholic historians, indeed, go further, and while they admit and denounce the clumsy fraud, contend that the easy and universal acceptance which the decretals met, furnishes the strongest presumption that the discipline which they have elaborated and methodized, was already in full possession, although without the formal and written law which the daring adventurer attempted to provide in the decretals of the early pontiffs.

It is curious that the author, the place, and the date of this singular forgery are still matter of uncertainty. It is certain that it did not come from Rome; and the most probable conjecture assigns its origin to Mentz, at some time between the years 840 and 847. It was introduced under the name of Isidore of Seville, as a part of the genuine collection known as his, and was believed to have been brought from Spain by Riculf, the archbishop of Mentz. It is hardly possible, in an age of discussion like ours, to doubt that, when the decretals first appeared, even the most superficial inquiry, or the slightest critical investigations of the historical sources, would have sufficed to detect the fraud. "It is impossible," says dean Milman, "to deny that at least by citing without reserve or hesitation, the Roman pontiffs gave their deliberate sanction to this great historic fraud;" and yet it is equally impossible to fix the limit beyond which, in an age so uncritical, literary or historical credulity might not be carried without provoking its susceptibility, or disturbing its peace.

From the first circulation of the false decretals down to the 15th c., no doubts were raised regarding them. Nicholas of Cusa and cardinal Turrecremata were the first to question their genuineness; but after the reformation, the question was fully opened. The centuriators of Magdeburg demonstrated their utterly apocryphal character. A reply was attempted by Father de la Torre; but the question may be said to have been finally settled by Blondel.—See Milman's *Latin Christianity*, ii. 370-80; Walther's *Kirchenrecht*, p. 155; Gfröer's *Kirchengeschichte*.

I'SINGLASS. See **GELATINE**.

I'SIS, the name of an Egyptian deity, the sister and wife of Osiris, called by that people *Iles*, daughter of *Seb* or Chronos, and *Nu* or Rhea; according to other versions, of Hermes and Rhea, born on the 4th day of the Epagomenæ, or five days added to the Egyptian year of 360 days. After the murder of Osiris by Typhon, and the throwing of him in a coffin into the Tanitic mouth of the Nile on the 17th Athyr, Isis was informed of the deed by the Pans and Satyrs, and went into mourning at Coptos; and hearing from some children where the chest had been thrown, proceeded to seek for it in company with Anubis, and discovered it inclosed in a tamarisk column in the palace of Malcander, at Byblos; and sitting down at a fountain in grief, was discovered by the ambrosial scent of her hair, and invited to the court by the queen Astarte, to nurse her children. One of these she fed with her finger, and endeavored to render immortal by placing him in flames, while she herself, under the form of a swallow, flew round the column and bemoaned her fate. Having obtained the column Isis took out the chest of Osiris, wrapped it in linen, and lamented so deeply that the youngest of the queen's sons died

of fright. She then set forth with the chest and eldest son to Egypt, dried up the river Phaedrus on her way, and killed with her glances the eldest son, named Maneros, who had spied her secret grief in the desert. Having deposited the chest in a secret place she proceeded to Buto to Horus; but Typhon discovered the chest, and divided the body into 28 or 26 portions, and scattered it over the country. These the goddess again sought, and found, except the phallus, which had been eaten by fish; and wherever she found any of the limbs, she set up a tablet, or sent an embalmed portion, deposited in a figure of the god, to the principal cities of Egypt, each of which subsequently claimed to be the true birthplace of Osiris. After the battle of Horus and Typhon, Isis liberated Typhon, and had her diadem torn off, and replaced by one in the shape of a cow. She was the mother of Haroris by Osiris before her birth, and of Harpocrates after the death of Osiris. She buried Osiris at Philæ. The monarch Rhampsinitus played at dice with her in Hades. Her soul was supposed to have passed into the star Sothis or Sirius. Her worship was universal throughout Egypt; she was particularly worshiped at Philæ and at Bubastis, where a special festival was celebrated to her; and her tears were supposed to cause the inundation of the Nile. Another festival was celebrated to her at the harvest.

In the monuments she is called the goddess-mother, the mistress of heaven, sister and wife of Osiris, and nurse of Horus, the mourner of her brother, the eye of the sun, and regent of the gods. In her terrestrial character, she wears upon her head the throne which represented her name; in her celestial, the disk and horns, or tall plumes. She is often seen suckling Horus; sometimes she has the head of a cow, indicating her identity with the cow Athor, of whom the sun was born. Occasionally she is identified with other female deities, such as Pasht. On her head she wears the vulture symbol of maternity. Her attributes were assumed by the queens of Egypt, and Cleopatra sat and gave responses in the character of the youthful Isis.

The worship of Isis was introduced into Rome by Sulla (86 B.C.) from Tithorea, and shared the fate of that of other Egyptian deities, being associated with that of Serapis, Anubis, and others, and the temples from time to time destroyed. It flourished under the Flavians and Hadrian. At this time Isis was represented with a sistrum or rattle, a bucket, and a dress with a fringed border, knotted at the chest. On the Alexandrian coins, Isis appears as *Pharia*, before the Pharos, holding a full sail. The festivals, seclusion, rules of chastity, attracted many followers, but the worship was not altogether considered reputable by the Romans. It was more extended and respected in Asia Minor and the provinces, but fell before Christianity (391 A.D.). Isis was worshiped as the giver of dreams, and in the twofold character of restorer of health and inflicter of diseases.

The myth of Isis, as given by Plutarch, appears to be a fusion of Egyptian and Phenician traditions, and the esoterical explanations offered by that writer and others show the high antiquity and unintelligibility of her name. She was thought to mean the cause, seat, or the earth, to be the same as the Egyptian Neith or Minerva, and Athor or Venus; to be the Greek Demeter or Ceres, Hecate, or even Io. Many monuments have been found of this goddess, and a temple at Pompeii, and a hymn in her honor at Antioch. The representations of her under the Roman empire are most numerous, Isis having, in the pantheistic spirit of the age, been compared with and figured as all the principal goddesses of the Pantheon.—Plutarch, *De Iside*; Herod. ii. c. 59; Ovid, *Met.* ix. 776; Bunsen, *Egypt's Place*, i. p. 413; Wilkinson, sir G., *Mann. and Cust.*, iii. 276, iv. 366; Birch, *Gall. Ant.* p. 31.

ISIS. See THAMES.

ISKANDEROON', or **ALEXANDRETTA**, a seaport of Asiatic Turkey, on the coast of Syria, is situated on a gulf of the same name, 60 m. w.n.w. of Aleppo, of which it is the port. Its harbor is the best on the Syrian coast; but the town itself, though much improved within late years, is still poor and miserable. Numerous vessels of large tonnage, and with cargoes the value of which is considerably upwards of a million sterling, annually enter and clear the port. Galls, silk, cotton, and fruits are exported; and the chief imports are rice, corn, salt, and goods of British manufacture. Pop. 1000.

ISKELIB, or **ESKILUP**, a t. of Asiatic Turkey, in the vilayet of Anatolia, near the Kizil-Irmak, about 260 m. e. of Scutari. There are several mosques and a ruinous castle on the top of a bold and naked limestone rock. In the neighborhood are sepulchral caverns, some of which are sculptured. Pop. estimated at 9,000.

ISLA, JOSÉ FRANCISCO DE, 1703-81; b. Spain; a Jesuit preacher and satirist, a man of acute wit and intense humor. He ridiculed a religious festival at Salamanca and a royal pageant at Pampeluna by an ironical eulogy so artfully disguised that at first it was regarded as an honest adulation, but upon its burlesque character becoming known, he was compelled to leave the city. His most important satire was *The Life of the Popular Preacher, Fray Gerundio*, in whose adventures he held up to public contempt the ignorance and audacity of the itinerant friars of the time. It was condemned in 1760 by the inquisition on the clamor of the lower clergy, but his popularity saved him from personal persecution. His poem *Cicero* is rich and pungent in sarcasm. A copy of it was presented to the Boston athenæum in 1844, with some of his autograph letters.

IS'LA DE LEON', a narrow island in the Atlantic, s. of Spain, separated from the mainland by the strait of Santi Petri. It is 10 m. long; pop. 10,000. On it are the cities of Cadiz and Isla de Leon. It is fortified, has several convents, 2 hospitals, and an observatory.

IS'LA DE NÉGROS, one of the group of islands in the Malay archipelago, known as the Philippines. It is 140 m. long, and averages 25 m. in width, its total area being 3,827 sq.m., with a pop. of 255,827, in scattered Spanish settlements, mostly on the n. shore.

ISLA DE PINOS, an almost circular island, of 800 sq.m. and 900 inhabitants, is the largest of the numerous satellites of Cuba, lying off the s. coast of the queen of the Antilles, pretty nearly on the meridian of the capital, Havana. It is celebrated for its excellent climate, exuberant fertility, rich mines, and valuable timber.

ISLÀM, or ESLÂM (Arab.), the proper name of the Mohammedan religion; designating complete and entire submission of body and soul to God, his will and his service, as well as to all those articles of faith, commands, and ordinances revealed to and ordained by Mohammed the prophet (see MOHAMMEDANISM). Islam, it is held, was once the religion of all men; but whether wickedness and idolatry came into the world after the murder of Abel, or at the time of Noah, or only after Amru Ibn Lohai, one of the first and greatest idolaters of Arabia, are moot-points among Moslim (a word derived from *Islam*) theologians. Every child, it is believed, is born in Islam, or the true faith, and would continue in it till the end were it not for the wickedness of its parents, "who misguide it early, and lead it astray to Magism (see GUEBRES), Judaism, or Christianity." See MOHAMMED KORÂN.

ISLAMABAD'. See CHITTAGONG.

ISLAND (Ang. Sax. *igland*, "properly, eye-land, a spot of land surrounded by water, as the eye in the face"—Wedgewood; Ice, *ey*, Dan. *øe*, meaning isle, and akin to eye; the *s* in island crept in through the influence of Fr. *isle*, derived from Lat. *insula*), in geography, land surrounded with water. New Holland is sometimes regarded as a continent, and sometimes as an island; so that the distinction of the terms is somewhat vague; even the great eastern and western continents are surrounded with water. In the ocean between New Holland and Asia, and to the eastward, islands are more numerous than anywhere else in the world. There, also, the largest islands are found. Excluding New Holland, the largest islands in the world are Borneo and Greenland; after these, New Guinea, Madagascar, Sumatra, and Great Britain. Islands are often in groups, and when the number is great, the assemblage is called an archipelago. Some islands have the appearance of intimate geological connection with the continents near which they are situated, and some of such connection with each other that they seem as if they were the remaining parts of a former continent; others, generally of a more circular form, have their geological character more complete in itself. In the South seas there are two very distinct classes of islands, the one mountainous, and often with active volcanoes; the other low and flat, formed of coral. See CORAL ISLANDS.

ISLAND, a n.w. co. of Washington territory, comprising the two islands Whidby and Camano, and bordering on the strait of Juan de Fuco; pop. '70, 626. Whidby is 40 m. long, but quite narrow, and noted for its fertility and salubrity. The staple products are grass, barley, wool, and potatoes. The county is partly covered with forests. Capital, Coupeville.

ISLAND POND, a village of Essex co., Vt., on a small lake of the same name; pop. 300. It is on the Grand Trunk railroad, 149 m. from Portland. It has 3 churches, a newspaper, flouring and lumber mills, and a custom-house. It is on the boundary between the United States and Canada.

ISLANDS OF THE BLESSED were, according to a very old Greek myth, certain happy isles situated towards the edge of the western ocean, where the favorites of the gods, rescued from death, dwelt in joy, and possessed everything in abundance that could contribute to it.

ISLAY, an island on the w. coast of Scotland, belonging to the group of the Inner Hebrides, and to the co. of Argyle, lies w. of the peninsula of Kintyre, from which it is distant about 15 m., and s.w. of the island of Jura, from which it is separated by a strait called the sound of Islay. Greatest length, 24 m.; greatest breadth, 17 m.; area, about 220 sq.m.; pop. '71, 8,143. In the n. the island is hilly, and along the eastern shore runs a ridge rising from 800 to upwards of 1500 ft. in height. The central and western districts are undulating or flat. Agriculture has of late years been greatly improved; the number of acres under cultivation is about 22,000, and abundant crops, both white and green, are produced. There are eight distilleries on the island, which produce about 400,000 gallons of whisky annually. Chief exports: black-cattle, sheep, and whisky. Lead and copper ores have been worked in mines in the interior, but not shipped to any considerable extent.

ISLE LA MOTTE, an island 6 m. long in lake Champlain, forming the township of Isle la Motte, Grand Island co., Vt. It is 30 m. n. of Burlington. Pop. '80, 504.

ISLE OF DOGS. See Dogs, ISLE OF, *ante*.

ISLE OF FRANCE. See MAURITIUS, *ante*.

ISLE OF MAN. See MAN, ISLE OF, *ante*.

ISLE OF WIGHT, ENGLAND. See WIGHT, ISLE OF, *ante*.

ISLE ROYALE, a co. of Michigan, including the island of the same name, together with several smaller islands, in lake Superior, n.w. of Keweenaw point. Isle Royale island, 40 m. long, is extensively covered with trees, and abounds in copper and other minerals. The county is remarkable for the interesting discoveries made of the relics of a prehistoric people to whom the use of copper was known. Some of their excavations, propped up with huge wooden supports, now dropping to decay, show a wonderful knowledge of the art of mining. Their tools were of stone and copper, and many of them are found on the island. Siskwit bay is a small settlement of miners employed in the copper-mines of a New York company. Capital, Minong. Pop. '80, 55.

ISLES, LORDS OF THE. The lords of the Isles are famous in poetry and romance, but no proper historical account of them has yet been written, and it is difficult to discriminate between truth and fable in the various notices which have been preserved. The western islands of Scotland, or Hebrides, as they were afterwards called, originally a portion of the domains of the Scots and Picts, were afterwards subdued by the Norwegians. When Scotland became consolidated into one monarchy, its kings endeavored to wrest the islands from the Norsemen; and during the contest which ensued, the various chiefs sometimes professed allegiance to the king of Scotland, and sometimes to the king of Norway, or their own more immediate superior, who ruled in Man. The Scottish supremacy was finally established by the victory of Largs, in the reign of Alexander III., and the final cession of the islands by Magnus, son of Haco, king of Norway, made in the year 1266. By that treaty, all the islands of the Scottish seas, except those of Orkney and Zetland, were surrendered to Scotland. Man was conquered by the English during the wars of the succession, but the other islands remained subject to the Scottish sovereigns. The first name which generally appears in the lists of the lords of the Isles, as distinct from the kings of Man, is Somerled; and the great chiefs who afterwards held the islands and portions of the mainland near them, claimed descent from this powerful lord. He appears prominently in Scottish history in the middle of the 12th c., during the reigns of David I., and his grandson and successor, Malcolm IV. How he acquired his great authority is not precisely known. Even the race to which he belonged is uncertain; probably, like most of his subjects, he was of mixed descent, Norwegian and Celtic. His sister was married to Malcolm Mac-Heth, the head of the great Celtic family of Murray, who has been confounded by most Scottish writers with the impostor Wimund, and whose true history has been explained by Mr. E. W. Robertson in his *Scotland under her Early Kings*. In the year 1164 Somerled landed on the coast of Renfrew, at the head of his subjects of Argyle and the Isles, and was defeated and slain. His dominions seem to have been divided among his three sons—Dugal, Angus, and Reginald or Ronald. The descendants of Dugal became lords of Argyle and Lorne; and those of Reginald, lords of the Isles. Reginald is said to have been succeeded by Donald, and Donald by Angus Mor, who was the father of Angus Og. We know from Barbour that Angus of the Isles, "lord and leader of Kintyre," gave his fealty to Bruce when most hardly pressed at the beginning of his reign, receiving him into his castle of Dunaverty, and that he afterwards fought under the great king at Bannockburn. This chief is the hero of *The Lord of the Isles*, but his name, as Scott tells us, "has been euphonie gratiā, exchanged for that of Ronald." John of the Isles, son of Angus, married, first, his cousin, Amy of the Isles, and secondly, Margaret, daughter of king Robert II.; and among his descendants by these marriages are said to be the McDonalds of Sleat, Keppoch, Glengarry, and Clanranald. During the troubled and disastrous reign of David II., John of the Isles was able to maintain himself in a state of practical independence of the Scottish crown. He was at last, however, obliged to submit. He met David at Inverness in 1369, and gave hostages for his fidelity. His successor was Donald, his eldest son by Margaret of Scotland, and the most powerful of all the Island lords. He set the kings of Scotland at defiance, and made treaties as an independent sovereign with the kings of England. He married Margaret, daughter of Euphemia, countess of Ross. Margaret's brother, Alexander, earl of Ross, by his marriage with the daughter of the regent Albany, left an only child, who became a nun. Donald claimed the earldom in his wife's right; and when this claim was refused by the regent, he prepared to maintain it by force. Taking possession of Ross, he marched at the head of a large army from Inverness, through Murray and Strathbogie, entered the Garioch, and threatened to destroy the burgh of Aberdeen. At Harlaw (q.v.), near Inverurie, he was encountered on St. James's eve, 1411, by a Lowland army much inferior in number, commanded by Alexander Stewart, earl of Mar. The action was fiercely contested, and, though not decisive in itself, the lord of the Isles retreated, and all the advantages of the combat remained with Mar. This engagement, famous in history and song, probably saved the Lowlands of Scotland from Celtic supremacy. Donald was soon afterwards obliged to surrender the earldom of Ross, and to submit to the regent. He was succeeded by his son, Alexander. This lord, like other great Scottish nobles, was seized and imprisoned by James I., who was determined to allow no rule in Scotland except his own. When restored to liberty, he again broke out into

insurrection, but his army was routed; and in order to obtain pardon, he appeared at the altar of the church of Holyrood, and kneeling half-clothed before the king, presented his sword, and implored forgiveness. After a short imprisonment he was again pardoned. Upon his mother's death, he assumed the style of earl of Ross, and seems to have been in possession of the earldom. He was succeeded as earl of Ross and lord of the Isles by John, his eldest son. John, like his predecessors, acted as if he were an independent sovereign rather than a vassal of the king of Scots. He entered into a confederacy with the earls of Douglas and Crawford, the one, the most powerful nobleman in the s., the other, in the center of Scotland; and had they acted together with promptness and determination, the house of Stewart might have ceased to reign. In Oct., 1461, at his castle of Artornish, on the coast of Argyle, he granted a commission to his kinsman Ronald, and Duncan, archdeacon of the Isles, to enter into a treaty with Edward IV. of England. By that treaty, which was concluded in the following year, he agreed to become liegeman to Edward, and to assist him in conquering Scotland. He was attainted more than once, and finally was obliged to resign the earldom of Ross, which was annexed to the crown. This took place July 10, 1476, and John was at the same time created lord of the Isles. He is said to have died in 1498. After his decease, the title of lord of the Isles was assumed by Donald the bastard, son of Angus of the Isles, an illegitimate son of John, lord of the Isles; and several chiefs were attainted in 1503 and 1505 for supporting his claims. In July, 1545, another Donald, styling himself earl of Ross and lord of the Isles, presiding in a sort of Highland parliament, granted commission to the bishop elect of the Isles and another person to enter into a treaty with the earl of Lennox, then acting for Henry VIII. of England. This document is given by Mr. Tytler, the historian of Scotland, who remarks that "it is a diplomatic curiosity, not one of the Highland chieftains, eighteen in number, being able to write his name." In a paper addressed by the Highland commissioners to the privy council of England, they speak of their constituents as "the auld enemies to the realm of Scotland," the very name by which the Scottish parliament was wont to speak of the English. Various persons, claiming to be descendants of John, earl of Ross, assumed the style of lord of the Isles; but the title does not appear to have been recognized after his decease, except as annexed to the crown. The eldest son of the Scottish sovereign has generally used the style of lord of the Isles, along with his other titles.

ISLES OF SHOALS, a cluster of 8 barren rocky islands in the Atlantic ocean off the coast of New Hampshire, 10 m. s.e. of Portsmouth. The two largest are Appledore, containing 400 acres, and Star, 150. On these are large hotels for visitors, who resort there for the sea air, boating, and fishing. A steamer runs daily from Portsmouth. On White island is a revolving light 87 ft. above the sea. These islands are inhabited by a few fishermen.

ISLINGTON, a suburb of London, but so closely connected with it as to form part of it, is situated 2 m. n. of St. Paul's. Pop. in 1851, 95,329; in 1861, 155,341; in 1871, 213,778; it is remarkable for the number of its religious, educational, and benevolent institutions.

IS'LIP, a village of Suffolk co., Long island, N. Y., 44 m. e. of Brooklyn, is on Great South bay, and on the South Side railroad. It is a summer resort. It has 3 churches, 2 academies, several mills, and a shipyard. Pop. 1500. The total population of the township, containing the large villages of Bay Shore and Sayville, is 5,815.

ISMAEELIAH, or **ISMAËLIANS**. See ISMAILIS, *ante*.

ISMAIL, a t. and river port in the Russian government of Bessarabia, on the n. bank of the Kilia branch of the Danube, about 40 m. from the mouth of that river. It was taken and destroyed by Suvorof in Dec., 1790; came into possession of Russia in 1812; was assigned to Moldavia by the treaty of Paris, 1856; and was transferred to Russia again by the Berlin Congress of 1878. It carries on an important trade in corn, as well as a considerable general trade. Pop. above 20,000.

ISMAILIA. See SUEZ CANAL.

ISMAILIS, is the name of a very advanced "free-thinking" Mohammedan sect, of the Shiïte branch of Islam (see SHIITES), which sprang up in the 9th c. A.D., and spread throughout Mohammedanism. Recognizing Ali alone as the rightful successor of the prophet, they held Abu Bekr, Omar, Othman, Moawia, to be usurpers, and counted their imams, or representative prophets, from Ali only. The seventh imam was one Ismaïl, who lived about 150 Hedjrali (772 A.D.), the son of Jafar Assadik, or rather of his son, Mohammed. He was supposed to be the righteous prophet, the only orthodox, spiritual head. The notion of the imam, in general, is that of an ever-living, though, at times, hidden, supreme guide of the people, who, after a time, is restored to humanity, or at least to the believing part of it. A prayer, preserved to us by Ibn Chaldun, will best show the peculiar notion connected with this belief, to which no small part of Islam confessed. Every evening, a certain number of imamieshs prayed: "O imam, appear unto us! Humanity is awaiting thee; for righteousness and truth have perished, and the world is gone down in darkness and violence. Appear unto us, that we may, through thee, return unto God's mercy." It was thought, in fact, that Ali himself had reappeared in every imam, and that he would descend again, some day, "from the

clouds," to unite all believers, and to restore the pure faith. The real importance of this sect, which had existed unobserved for some time, dates from Abdallah Ibn Mai-mun, whose father had been executed for professing materialistic doctrines, and trying to turn people away from the doctrines of Islam. Abdallah seems to have practically carried out his father's notions, but more cautiously. He is described by the Arabic writers as an utterly irreligious and unscrupulous materialist or "Zendik." The Messiah, whom he preached, stood higher than Mohammed himself, and though he did not exactly reject the Koran *en bloc*, he yet contrived to allegorize and symbolize away nearly all its narratives and precepts. But the systematic way in which Abdallah went to work, in trying to undermine, and eventually to abrogate, all Islam, and, as his biographers have it, to replace it by materialism, atheism, and immorality, is very remarkable indeed.

He established missionary schools; and the instructions given to the young missionaries were artfully designed to win over not merely all the different Mohammedan sects, both Sunnites and Shiites, but also Jews and Christians. The missionary's (*dai's*) first task was to win for himself the perfect confidence of the proselyte to be, by the affectation of great orthodoxy, and by a vast display of pious learning, chiefly Koranic. The disciple is by degrees to be cross-examined on difficult passages, on their "spiritual meaning," and on some points touched upon belonging to the physical sciences. Only matters of acknowledged obscurity and uncertainty are chosen as subjects of discourse, matters the real understanding of which belongs exclusively to the "aristocracy of learning." Generally, the youth is so deeply impressed with the erudition displayed, the expectations raised, the mystery, and the rest, that he will follow gladly to the end. But, at times, the missionary meets with a less docile subject, a man who may be accustomed to discussions on these topics, who may have pondered over these things himself: the *dai* shall appear to accommodate himself to such a one's views, applaud all he says, and thus ingratiate himself with him; all the while taking care to show himself well informed on those points which may be in favor with his disciple, and that mode of faith which he professes. All this is to be done very carefully, lest the other might "suspect and betray." The ordinary individual, on the other hand, is, after the first preliminaries, to be told that religion is a secret science, that most people know nothing of it, or utterly misunderstand it, that if the Moslems knew what degree of science God has imparted to the imams, by quite a special favor, there would no longer be any dissensions among them. The disciple, whose curiosity has by that time been fully roused, is then to be instructed in a few allegorical interpretations of both the practice and theory of the Koran; and when he is convinced of the desirability to know more, and everything that the master knows, the latter is merely to point out to him that all this knowledge belonged of right to all Islam, but that the wickedness and perverseness of those who followed the wrong successor, has caused all dissension and infidelity in the community of the believers. It is the imams who are the dispensers of the right interpretation, not people's own reason and judgment.

For the religion of Mohammed, they were to tell the disciple at this stage, was not a thing easy to comprehend. It did not mean to flatter the senses, or to dazzle by outward signs. It was on the contrary, a difficult, the most difficult matter. Only angels of the first rank, or a prophet specially chosen, or a faithful servant whose heart God had searched and found true, were worthy of bearing this most precious of all burdens. By these and other speeches, the ordinary disciple is soon brought to revere and to admire the *dai* beyond all other men around him, upon whom he henceforth only looks as inferior beings and infidels, and his desire of knowing more or all becomes passionate. But hitherto the procedure has been discreet. All that was desired in this first preliminary stage, was to unsettle the man's faith. The preparatory questions put to the neophyte were so contrived as completely to puzzle and bewilder him (e.g.—Why did God take seven days to the creation of the world? Why are there 12 wells and 12 months? What is the figure of your soul?); and if the missionaries themselves proceeded to answer them, it was by allegorizing interpretations of the Koran, the Sunnah, and the laws. But they used the common artifice of stopping short just in the middle of an explanation, for they said, when pressed to continue: "These things are not lightly to be communicated; God always requires a pledge first. If you will swear it to my hands, with the most solemn and inviolable oaths, never to divulge our secret, never to give any assistance to our adversaries, never to lay a trap for us, and never to speak to us unless for the purpose of telling us the truth, then I will tell you more." When, if the neophyte has taken the requisite oath—and it is only at the very commencement of the initiation that oaths are of any moment to the Ismaili—he is further asked to contribute a certain sum of money, as a pledge for his sincerity. Should the convert, however, exhibit the slightest degree of reluctance either in swearing or in paying, he is instantly given up by the *dai*—"a prey to the never-to-be-solved doubts of his heart."

Thus far the *first* preliminary degree. In the *second*, the missionary begins to initiate the neophyte's mind into the doctrines of the Imamat—i.e., to prove to him, by arguments and proofs best adapted to his mind, how the understanding of God's religion can only be accomplished by following the revelations given to and communicated by certain special delegates; whose names are communicated to him in the *third* degree. There are, he is told, seven such imams, as there are (according to the Koran, Sur. 65, 12)

seven planets, seven heavens, seven earths—viz., Ali, Hassan, Husein, Ali Zein Alabidin, Mohammed Albakir, Jafar Assadik, Ismail. In the *fourth* degree, the proselyte learns that the number of the prophets, whose task it was to abrogate at different periods the ancient forms of faith, and to substitute new laws, is also seven, like that of the imams; that each of them had a “companion,” to whom he confided his whole dispensation and its sacred meanings, and that the latter communicated the same in a secret manner, and by oral tradition, to another man after him, who again handed it down to a successor; until, after a string of seven such “successors,” or *samet* (silent ones), in contradistinction to the prophet (*natik*) or speaking, teaching one, a new imam is born. The traditional chain has thus never been broken. After seven times seven such successions of prophets and their “silent” successors—during which seven religions were successively abrogated—there appeared the last and crowning prophet, who abrogated all the religions that were before him, and who is the “chief of the last century”—the last *natik*. These seven are: (1) Adam, with his companion (“Soos”) Seth; (2) Noah, with Sem; (3) Abraham, with Ismael; (4) Moses, with Aaron. The last of the seven “silent ones” that followed him was John, the son of Zachariah. The 5th is Jesus, the son of Mary, with Simon “Kepha”—by them supposed to be Arabic = purity. The 6th of the “speaking prophets” is Mohammed, the son of Abdallah; with him was Ali, the son of Abu Talib; and he was followed by six other “silent ones,” who transmitted to each other the secret mysteries of his religion; the last of whom was Ismael, the son of Jafar Sadik. The 7th of the prophets is the “chief” or “master of the century.” In him culminate and are completed all those sciences which are called “the sciences of the primeval ones.” It is he who has first fully opened up the inner and mystic meaning of the words of faith; from him, to the exclusion of every one else, their explanation is to be received. He, and he alone, is to be followed, obeyed, and trusted in all things. By utterly submitting to his words and teachings alone, man is in the right path. All the prophets and all their teachings without exception before him are abrogated through him and by him.

In the *fifth* degree, the Koran and its precepts are made the subjects of discussion. It is proved to the convert how utterly wrong and foolish it is to interpret the words in their usual sense. Here, again, great subtlety is brought to bear upon the disciple. If he be a Persian, he is told that the Arabs are the oppressors of his country, upon which, with other humiliations, they have also imposed the slavish worship of this book. If he be an Arab, his mind is wrought up against the Persians, who, he is told, have appropriated to themselves the pontificate and the sovereignty that by rights belonged to the Arabs. He is then instructed in a multitude of mystical relations of things depending upon numbers.

The practical religious instruction begins with the *sixth* degree, into which the neophyte only enters when fully prepared in his mind to deny all positive religion, and when he has given the most undoubted pledges of his discretion and silence. Every Koranic precept is now allegorized. Prayer, tithes, pilgrimage, legal purity, and other religious observances, are cautiously and systematically interpreted to mean certain spiritual things only. These precepts, the missionary explains, have only been established “as enigmas by the philosophical prophets and imams, who saw in them the only means of keeping the common people in dependence, of exciting them to actions useful to society, of preventing them from hurting each other, and to commit gross crimes.” But by slow degrees, the philosophers, Plato, Aristotle, Pythagoras, and their systems are introduced to the neophyte. They and their systems are contrasted with the prophet and the imams, and their dicta. The result is represented as by no means flattering to the latter. He is distinctly shown the absurdity of a blind belief in so-called historical traditions; it is made clear to him how hearsays and legends differ from reason and the full and free action of the logical faculties: in this way the open contempt with which the imams themselves are then spoken of, no longer shocks the disciple to any very great extent.

The *seventh* degree paves the way for the negation of God’s unity, which is fully carried out in the *eighth*. Here the Demiurgos, i.e., a second god, but little inferior to the Supreme Being, is the real creator of all things. The first cause, or the “pre-existing,” has neither hands nor attributes; no one is to talk of him, or to render him any worship. Much as this part of the doctrine has given cause to discussions within the bosom of the Ismailis themselves, it is yet scarcely doubtful that it is the notion of the Demiurgos that has crept in here. Hamza himself speaks of this “pre-existence” as the Word, or *Logos* (q.v.), although nothing can be more obscure than the manner in which this most abstruse dogma is either explained or denied by the different doctors. The Koran and the “word of God” are then taken in hand, and explained to the proselyte in a fashion very different from the one he had been accustomed to before. The resurrection, the end of the world, the supreme judgment, the distribution of rewards and punishments, are treated as allegorical or mystical symbols of the revolutions of the stars and the universe, which follow each other periodically, and of the destruction and reproduction of all things terrestrial, such as physical science and philosophy teach. The *ninth* and concluding degree of initiation frees the proselyte from all and every restraint with regard to his belief. He may, and some do, adopt the system of Manes (see LARES), of the Magi (q.v.), of Aristotle or Plato, or he may proceed eclectically with

them all. As to the notions previously instilled into his mind with regard to the prophets or the imams, he is now led to look upon all those "inspired" people as without exception inferior to Mohammed ben Ismaïl, the chief and doctor of the last period. The disciple learns, at this stage, that no miracle has ever been performed by any one of them; that the prophet is merely a man distinguished by his purity and the perfection of his intelligence, and that this purity of his intelligence is precisely what is called "prophecy." God throws into the prophet's mind what pleases him, and that is what is understood by "Word of God." The prophet clothes this Word afterwards with flesh and bones, and communicates it to the creatures. He establishes by this means the systems of religious institutions which appear to him the most advantageous for the ruling of men; but these institutions and behests are but temporary, and intended for the preservation of order and worldly interests. No man who *knows* need practice any single one of them; to him, his *knowledge* suffices.

As to Mohammed, the son of Ismaïl, of whom the proselyte is told at first that he will reappear in this world—he is afterwards represented to him as merely destined to reappear in his doctrine, by means of the propagation of his pure philosophy by the mouth of his disciples and apostles. As to the Arabs themselves, the missionaries teach that God abhors them, on account of their having killed Husein, the son of Ali, and that he has therefore taken from the caliphs the Imamat, as he took from the Israelites the prophetic succession, when they had killed their prophets.

Thus the creed of the Ismailis had been gradually built up. Many changes were introduced into it at different times, and among them this very important one: that the person of Mohammed, the son of Ismail, itself was changed for another, a descendant of Abdallah, the son of Maimun Kaddah.

The two principal writers on this subject are Makrizi and Nowaïri; to the latter of whom the greater part of the foregoing information is due. He has preserved for us at length the very curious oath imposed upon the proselytes at the beginning of the initiation; and also certain instructions reserved for the missionary himself, which simply teach him to "be all things to all men." The following is a characteristic sample: "Then, again, there will be those to whom you must preach the belief in a living Imam. Say Mohammed ben Ismaïl is alive at this moment. Be very gentle and very modest with them; pretend to despise gold and silver; make them recite 50 prayers a day; recommend them to abstain from lying and other vices, also from wine. These people are of the utmost use to us. Leave them in their special creed, only just telling them some of the mysteries of the number Seven; but break their spirit by the surcharge of prayer. These will be our best proofs against any assertions of an advanced disciple, if he should betray us. Furthermore, these people, when properly managed, are sure to leave you at their death all their money, as they would, during their lifetime, give you everything they possessed without a murmur. The more advanced you may at once inform of the abrogation of Mohammedanism by our Imam—of the worthlessness of the Koran and its laws in their literal sense. To the still higher disciples you may confide the entirely spiritual nature of the Imam's 'life' in such a manner that their belief in the dogma of the resurrection is practically destroyed by it. From this stage you will conduct some to the renunciation of the belief in the existence of those heavenly beings, the 'angels,' and the creation of Adam as the first man on earth, while there were many before him. Having arrived at this point, you will find it marvelously easy to destroy the dogma of the existence of God and the mission of angels to the prophets, and to substitute for all this our own truth—i.e., the eternity of the universe. The last step is the abolition of both Mohammed ben Ismaïl and Ismaïl, who are only the 'gates' to knowledge."

So far the doctrines of the Ismailis, who, doubtless, aimed—apart from an original desire of purifying and allegorizing Mohammedanism, and elevating it to a philosophical system—at political power. How far one of their principal branches, the KARMAHIIANS, succeeded in this, will be found under that heading. See Makrizi, Nowaïri, Silvestre de Sacy, *Religion des Druses*, etc.

ISMAIL' PASHA', or ISMAIL I., Viceroy and Khedive of Egypt; b. Cairo, Egypt, 1830; is the second son of Ibrahim Pasha, and grandson of Meliemet Ali. Educated at Paris, on his return to Egypt he was appointed by his uncle Said Pasha to the government of the country during his uncle's absence in Europe, and in 1862 placed in command of the army. On the death of Said Pasha in 1863 he succeeded as the fifth viceroy of Egypt. During the American war of the rebellion he acquired vast wealth by the production of cotton. Regarding the Suez canal of count de Lesseps as conducing to the power and resources of Egypt, he actively encouraged the enterprise. In 1866 he secured from the sultan the hereditary succession in his line, and in 1867 had conferred upon him the title of khedive. Not satisfied with these privileges he demanded more, threatening to withdraw the troops he had sent against the Cretan insurgents and to seize Crete if his demands were refused. By the advice of foreign powers he recalled his demand. But in 1868-69, by extending his rule over the Upper and White Nile, by making foreign loans for the increase of his army and navy, by proposing the neutralization of the Suez canal and inviting foreign rulers to be present at its opening, he made himself almost an independent sovereign. The sultan commanded him to

reduce his army, recall his orders for iron-clads and breech-loaders, and the contraction of foreign loans, threatening him with deposition if he refused. Not receiving expected aid from Russia and other powers, he submitted. Afterwards he received new prerogatives, giving him control of his army, and liberty to make loans and commercial treaties. In 1874 he obtained a victory over the sultan of Darfur, central Africa. By public roads, agriculture, and other methods, he endeavored to civilize the surrounding rude tribes, and introduced many and various public improvements. But in 1879 the governments of France and England, in view of the wretched financial condition of Egypt and the dissatisfaction of the people with the administration, determined to interfere in behalf of good government, and united in demanding of the Porte that the khedive should commit the portfolios of finance and public works to English and French ministers. But the khedive resented any interference of the western powers with Egyptian affairs. The sultan offered to depose Ismail Pasha, and to appoint Halim Pasha, Ismail's uncle, as his successor; but the powers advised the khedive to abdicate, promising to support his son Tevfik. The sultan acquiesced in the course recommended, and, June 26, he signed the firman deposing the khedive in favor of his son, prince Mohammed Tevfik. Ismail at once complied with the demand, and his son was proclaimed khedive as Tevfik I. Ismail received an annual allowance of £50,000, each of his sons Hassan and Hussein £20,000; and his mother £30,000. Ismail Pasha left Egypt June 30, for Naples.

ISMUD', ISMID, or IZMID. See NICOMEDIA.

ISNARD, MAXIMIN, 1751–1830; b. France. In 1791 he was a member of the national assembly, in which he distinguished himself for his boldness and eloquence. He was re-elected in 1792. He joined the Girondists, and was arrested in June, 1793, but escaped, concealing himself with a friend until the fall of Robespierre. He appeared again in the assembly, and afterwards was a member of the council of 500. After this he lived in retirement in his native city, engaged in literary and philosophical pursuits.

ISNIK', or IZNECK. See NICÆA.

ISOBAROMETRIC LINES (Gr. *isos*, equal) are lines connecting together on a map those places which exhibit the same mean difference between the monthly extremes of the barometer. These oscillations are greater in some countries, as Hindustan and Newfoundland, than in others, as western Europe and the Antilles.

ISOCHRONISM (Gr. *isos*, equal, *chronos*, time). A pendulum is isochronous when its vibrations are performed in equal times, whether these vibrations be large or small; but it can only possess this property by being constrained to move in a cycloidal arc. See CYCLOID. This is managed by causing the string to wrap and unwrap itself round two equal cycloidal cheeks, the diameter of whose generating circle is equal to half the length of the pendulum. Isochronism is closely approximated in practice by causing the pendulum to describe a very small circular arc.

ISOC'RATES, a celebrated Grecian orator, was b. at Athens, 436 B.C. He had a weak voice, and much natural timidity, which shut him out from a political career; but he taught rhetoric, and wrote orations for others, for which he received large sums; and though he did not mingle in the strife of parties, he was earnestly interested in the cause of his country's independence and honor. The fatal battle of Chaeroneia broke his heart: he refused to taste food, and died after an abstinence of several days, 338 B.C., in the 98th year of his age. Isocrates was a friend of Plato. His orations, of which upwards of 20 are extant, are characterized by extreme carefulness and elegance of style, but are not to be compared with those of Demosthenes in fervor, or with those of Lysias in natural beauty and simplicity. The best modern editions are those of Lange (Halle, 1803), Ad. Coraës (Paris, 1807), G. S. Dobson (Lond. 1828), and Baier and Sauppe (Zürich, 1839).

ISODYNAM'IC, ISOCLI'NIC, and ISOGON'IC LINES (Gr. *isos*, equal, *dynamis*, force, *kline*, to bend, *gonia*, an angle), or lines of equal force, equal inclination, and equal declination, are three systems of lines, which, being laid down on maps, represent the magnetism of the globe as exhibited at the earth's surface in three classes of phenomena, the varying intensity of the force, the varying dip or inclination of the needle, and its varying declination from the true meridian. See MAGNETISM.

ISOLA BELLA. See BORROMEAN ISLANDS.

ISOLA GROSSA, or LUNGA (Great or Long island), one of the many islands which lie off the western coast of Dalmatia, in the Adriatic sea, extends between 43° 51' and 44° 11' n. lat. Greatest length, 27 m.; greatest breadth, 3 m.; pop. 12,000.

ISOLA MA'DRÉ. See BORROMEAN ISLANDS.

ISOM'ERISM (from the Greek word *isomērēs*, composed of equal parts), a term applied to those organic compounds which are identical in their ultimate or percentage composition, but present differences in their chemical properties. Isomeric compounds, or *isomerides*, are divisible into metameric compounds, or *metamerides*, and polymeric compounds, or *polymerides*.

In all metameric compounds, the equivalent number is the same, while in all polymeric compounds the equivalent numbers are simple multiples of the equivalent of the

lowest number of the group. As an illustration of metamerides, propionic acid, ($\text{HO.C}_3\text{H}_5\text{O}_3$), acetate of methyl ($\text{C}_2\text{H}_3\text{O.C}_3\text{H}_5\text{O}_3$), and formic ether ($\text{C}_4\text{H}_5\text{O.C}_2\text{H}\text{O}_3$) may be taken. Their rational formulæ, which express their probable constitution, are perfectly distinct, yet it will be at once seen that they all have the same empirical formula ($\text{C}_6\text{H}_6\text{O}_4$), and consequently the same percentage composition, and the same equivalent number, viz. 74.

As an illustration of polymerides, the hydrocarbons homologous with olefiant gas may be taken. Olefiant gas is represented by the formula C_4H_4 , propylene by C_6H_6 , butylene by C_8H_8 , amylene by $\text{C}_{10}\text{H}_{10}$. These substances have the same percentage composition, but different equivalent numbers, all the formulæ being multiples of the more simple formula, C_2H_2 , which represents the composition of an alcohol-radical, methylene, which has not yet been isolated.

The carbo-hydrates, which are represented by the general formula $\text{C}_x\text{H}_n\text{O}_n$, present well-marked examples of isomerism. Thus, cellulose ($\text{C}_{12}\text{H}_{10}\text{O}_{10}$), starch ($\text{C}_{12}\text{H}_{10}\text{O}_{10}$), and gum ($\text{C}_{12}\text{H}_{10}\text{O}_{10}$) are metamer; while grape-sugar ($\text{C}_{12}\text{H}_{12}\text{O}_{12}$) possesses the same percentage composition, but twice as high an equivalent number, as hydrated lactic acid ($\text{C}_6\text{H}_6\text{O}_6$), and the same percentage composition, but three times as high an equivalent number, as hydrated acetic acid ($\text{C}_4\text{H}_4\text{O}_4$); hence the three last-named substances are polymeric.

ISOMERISM (ante). Isomeric bodies may be considered as naturally divided into physical isomers and chemical isomers. The physical are more strictly or perfectly isomeric than the chemical, and on account of their similar molecular or radical composition when they are subjected to the action of different forces or reagents exhibit the same behavior. Thus there are several hydrocarbons known as terpenes, having the composition $\text{C}_{10}\text{H}_{16}$, as the oils of lemon, bergamot, and turpentine, which show the same reactions under the influence of chemical agents, except their difference of odor and action on polarized light. Chemical isomers merely, do not carry their isomerism so far, for although they may have the same proportion of elements, and also the same molecular weight, they do not exhibit the same behavior under reagents. Thus, the molecular formula $\text{C}_3\text{H}_6\text{O}_2$ represents three different bodies which decompose differently when acted upon by caustic alkalies, propionic acid, $\text{C}_3\text{H}_5\text{O.HO}$, being converted at common temperatures into propionate of potassium, $\text{C}_3\text{H}_5\text{O.KO}$. Acetate of methyl, $\text{C}_2\text{H}_3\text{O.CH}_3\text{O}$, is not changed at ordinary temperatures by caustic potash, but when heated with it, acetate of potassium and methylic alcohol are produced. Again, formate of ethyl, $\text{CHO.C}_2\text{H}_5\text{O}$, when heated with caustic potash, is changed into formate of potassium, CHO.KO , and ethyl alcohol, $\text{C}_2\text{H}_5\text{HO}$. These chemical isomers are the metameres mentioned in the preceding article, their behavior depending upon the manner in which organic radicals enter into their composition. See RADICAL, in chemistry. Another class of isomeric bodies are called polymers.

ISOMETRIC PROJECTION (Gr. *iōos*, equal, and *μέτρον*, measure), a kind of drawing used by architects and engineers for purposes of construction. It is an orthographic projection in which one plane or projection is employed, and therefore the measurement is without regard to the rules of perspective, the plane of the drawing being supposed to be at an infinite distance from the eye. It is used to delineate structures whose principal lines are parallel to three rectangular axes, and the plane of projection makes equal angles with these axes, which are called co-ordinate axes, and the planes, taken two and two, are called co-ordinate planes. The plane of projection passes through the point of intersection of the three axes, and this point is the center of projection. The projections of the co-ordinate axes are the directing lines of the projection, and form equal angles of 120° with each other.

ISOMORPHISM (derived from the Greek words *isos*, equal, and *morphe*, form) strictly signifies similarity of form, but it is now restricted by chemists to those substances which are not only similar in their crystalline form, but are also analogous in their chemical composition. The diamond (C), magnetic oxide of iron ($\text{FeO.Fe}_2\text{O}_3$), and alum ($\text{KO.SO}_3 + \text{Al}_2\text{O}_3.3\text{SO}_3 + 24\text{aq.}$), all crystallize in octohedra, but there is obviously no analogy in the chemical composition of these substances; on the other hand, the spinelle ruby ($\text{MgO.Al}_2\text{O}_3$), magnetic oxide of iron ($\text{FeO.Fe}_2\text{O}_3$), and chrome ore ($\text{FeO.Cr}_2\text{O}_3$), not only crystallize in octohedra, but (as their formulæ show) are also analogous in their chemical composition. Hence, the members of the latter group are truly isomorphous in the restricted sense, while the members of the former group present only one of the conditions of chemical isomorphism. In most cases, however, as Mitscherlich (to whom we owe most of our knowledge of this subject) has shown, the chemical composition of substances that correspond in form is analogous; and that chemist has further endeavored to prove that crystalline form is independent of the chemical nature of the atoms, and that it is determined solely by their grouping and relative position; the same number of atoms combined in the same way always producing, as he asserts, the same crystalline form.

Miller, in his *Chemical Physics*, gives fifteen groups in which the existence of isomorphism has been distinctly ascertained. From these we select three groups—one of elements, and two of compounds:

Arsenic	Chloride of Potassium, KCl	Alumina	Al_2O_3
Antimony	Iodide of Potassium, KI	Sesquioxide of Iron	Fe_2O_3
Tellurium	Bromide of Potassium, KBr	Sesquioxide of Chromium, Cr_2O_3	
	Fluoride of Potassium, KF	Sesquioxide of Manganese, Mn_2O_3	

The discovery of the coincidence of similarity in crystalline form where the chemical composition is also similar, is the most important generalization yet arrived at in the science of crystallography; and in chemistry it has been of essential service in facilitating the classification of compounds, and in determining the combining numbers or atomic weights of the elementary bodies.

ISOP'ODA (Gr. equal-footed), an order of malacostraceous crustaceans of the section *edriophthalma* (q.v.), mostly aquatic—some marine, some inhabitants of fresh waters—but some terrestrial, inhabiting damp places, as the armadillo, woodlouse, etc. The body is flattened. The thorax consists of seven segments bearing seven pair of feet—six in the young before their first molting. The females have usually large plates attached to the thoracic segments, meeting to form a pouch for the eggs and young.

The interesting fossils called *trilobites* (q.v.) are supposed to be *isopoda*, or nearly related to them.

ISOThERM'AL LINES (Gr. *isos*, equal, and *thermos*, warm) are lines laid down on maps to connect together places of the same mean temperature.—*Isothermal lines* (Gr. *thèros*, summer) are those which connect places of equal mean summer temperature.—*Isocheimonal lines* (Gr. *cheimón*, winter) connect places of equal mean winter temperature.—Alexander von Humboldt was the first to lay down these systems of lines on maps in 1817. Their importance in reference to climate, meteorology, and the geographic distribution of plants and animals, can hardly be overestimated.—If the whole surface of the earth were uniform, it is evident that isothermal lines would precisely correspond with the degrees of latitude, and there would be no isothermal and isocheimonal lines, as distinguished from the isothermal; but neither would the earth be habitable for man, or suitable for almost any of the animal or vegetable tribes which actually exist upon it. Isothermal, isothermal, and isocheimonal lines are therefore laid down altogether from observations recorded and compared. In laying them down, care must be taken to make allowance for the elevation of each place of observation above the level of the sea, they being all laid down as for that level. Isothermal lines are named according to the mean temperature which they indicate, the line of 50° , the line of 60° , etc. They are far from corresponding with parallels of latitude, nor are they parallel with one another, but are curved in such a manner as to indicate two northern and two southern poles or centers of greatest cold. It is in the extra-tropical parts of the northern hemisphere that these curvatures are greatest. The northern poles of cold are situated in the arctic regions, one to the n. of Siberia, nearly in the meridian of Jakutsk, and the other to the n. of America, nearly in the meridian of the most western part of Hudson's bay; and the isothermal lines throughout the greater part of the northern hemisphere descend to a lower latitude in the e. of Asia and in the e. of America than elsewhere, ascending, however, to a comparatively high latitude on the western coasts of both the great continents. Thus, the line of 50° F., which passes through the n. of England and the n. of Ireland, and there reaches its most northern latitude, descends below the latitude of New York, on the eastern coast of America. The distances of the isothermal lines are also remarkably various in different parts of the world. Thus, in the e. of North America, from Charleston to Labrador, the mean annual temperature varies more than a degree and a half for every degree of latitude; whilst in central Europe the variation is only about nine-tenths of a degree, and on the western coasts of Europe still less.

The isothermal and isocheimonal lines are neither parallel among themselves nor with the isothermal lines, and it is in this that a chief difference of continental and of insular climates appears, the summers of the former and the winters of the latter enjoying comparatively large proportions of the heat of the year.

Another interesting system of lines relative to temperature has been laid down by Mr. Dove, which he calls *isabnormal lines*—the term, however, is objectionable, as formed from words of two languages—lines connecting places which have the same excess above or defect below the normal mean temperature of their latitude. See CLIMATE, METEOROLOGY, and TERRESTRIAL TEMPERATURE.

ISPĀHĀN', properly ISFAHĀN, a famous city of Persia, capital of the province of Irak-Ajemi, and formerly capital of the entire country, is situated on the Zenderud, in an extensive and fertile plain, 226 m. s. of Teheran; lat. $32^{\circ} 40'$ n., long. $51^{\circ} 43'$ east. The Zenderud is here 600 ft. broad, and is crossed by three noble bridges, one of them 1000 ft. in length, and having 34 arches. Groves, orchards, avenues, and cultivated fields surround the city for miles; but the permanent beauty of the vicinity only serves to make the contrast all the more striking between the former splendor of the city and its present ruinous condition. Miles of street are now almost tenantless, and many of the palaces are deserted, and rapidly falling to decay. In the *Chahar Bagh*, an extensive pleasure-ground on the s. of the city, is a palace called the *Chehel Sitton*, or "Forty Columns," once a favorite royal residence. Along the front of this palace is a double range of

columns, each rising from the backs of four lions in white marble. The pillars are inlaid with mirrors, and the walls and roof are profusely decorated with glass and gilding. The suburb Julfa, on the southern bank of the river, once a flourishing Armenian settlement of 30,000 inhabitants, is now little better than a mass of ruins. Ispahan, however, is still an important city, and the seat of extensive manufactures, including all sorts of woven fabrics, from rich gold brocades and figured velvets to common calicoes. Trinkets and ornamental goods in great variety, with fire-arms, sword-blades, glass and earthenware, are also manufactured. Many of its bazaars are still crowded daily, and its merchants are still influential enough to affect prices in India. Of late years, too, Ispahan has shown considerable signs of improvement; many of its edifices have been rebuilt; rice, an important article of commerce, is now largely cultivated in the neighborhood. Pop. estimated at 80,000.

Ispahan was a trading town of importance, and the capital of Irak, under the caliphs of Bagdad. It was taken by Timûr in 1387, when 70,000 of the inhabitants are said to have been massacred. During the 17th c., under Shah-Abbas the great, it became the capital of Persia, and reached the climax of its prosperity. Its walls were then 24 m. in circuit, and it is said to have had between 600,000 and 1,000,000 inhabitants. It was then the emporium of the Asiatic world; the merchandise of all nations enriched its bazaars, and ambassadors from Europe and the east crowded its court. In 1722 it was devastated by the Afghans, and some time afterwards the seat of government was transferred to Teheran (q.v.).

ISRAEL, KINGDOM OF. See JEWS.

ISRAEL. See JACOB, *ante*.

ISRAELITES. See JEWS, *ante*.

ISRAFIL', one of the three angels who appeared before Abraham to announce the forthcoming fate of Sodom, and specially designated as the angel of music. According to the Koran, to Israfil is assigned the duty of sounding the "last trump" on the day of resurrection.

ISSAQÜÉNA, a western co. of Mississippi, having the Mississippi river on the w., and the Yazoo and Sunflower on the e.; 600 sq. m.; pop. '70, 6,887. It is watered by the Yazoo and Sunflower rivers. The surface is level, covered with thick forests, and often inundated. The soil is fertile, and produces cotton, maize, and sweet potatoes. Capital, Mayerville.

ISSOIRE (anc. *Issiodurum*) a t. of France, in the department of Puy-de-Dôme, at the confluence of the Couze and Allier, 20 m. s.e. of Clermont. Pop. '76, 6,089.

ISSOUDUN, a manufacturing t. of France, in the department of Indre, is situated on the river Théolle, on the railway from Orleans to Limoges, 18 m. n.e. of Châteauroux. The principal manufactures are woolen cloth and yarn. Pop. '76, 11,293.

ISSUE, in law, means the point of fact in dispute which is submitted to a jury.

ISSUE, in law (*ante*). The point in dispute between the parties to a suit may be one either of law or of fact. If the former, it is decided by the court without the intervention of a jury; if the latter, it is determined by a jury, or, in equity practice, by a judge. In some of the states of the union issues of both kinds may by consent of parties be tried by a referee. When a court of law or equity is sitting without a jury, it sometimes happens that a question of fact arises upon which the decision of a jury is desired. A fictitious suit is thereupon framed, involving the point in question, and brought to trial before a jury summoned for the purpose. The verdict rendered being returned to the court, is accepted as a settlement of the issue of fact, and the trial of the cause out of which that issue grew thereupon proceeds. In the state of New York a feigned issue in such cases is not required, the actual question as it arises being submitted to a jury by order of court.

ISSUS, anciently, a seaport on a gulf of the same name in Cilicia, Asia Minor, celebrated for a victory which Alexander the great obtained here over Darius (333 B.C.), by which the camp and family of Darius fell into his hands. Its exact site has not been ascertained.

ISTALIF', a t. of Afghanistan, situated 22 m. n.n.w. of Cabul, on a tributary of the Cabul river. In 1842 it was partially destroyed by the British. Previous to that event, it had 15,000 inhabitants, who were employed chiefly in spinning, weaving, and dyeing cotton.

ISTER. See DANUBE, *ante*.

ISTHMUS (Gr.), in geography, a narrow neck of land joining two portions of land. The name isthmus was by the ancients often employed without any addition to designate the isthmus of Corinth, joining the Peloponnesus to continental Hellas. Here there was a famous temple of Neptune, and here also were celebrated the ISTHMIAN GAMES (one of the four great national festivals of Greece), at first every third year, and afterwards every fifth year. They were said to have been originally instituted by Sisyphus, and afterwards restored by Theseus. The games, like those of Olympia, consisted of athletic exercises, with the addition of competitions in music and poetry. The victors were crowned with garlands of fir, and their statues were placed in the temple of Neptune.

Down to the destruction of Corinth by the Roman gen. Mummius (146 B.C.), the management of these games was in the hands of the rulers of that city, though the Athenians always enjoyed the seats of honour. The Romans added the coarser and more brutal amusements of gladiatorial exhibitions and fights with wild beasts. The spread of Christianity was fatal to their popularity, but we still read of them in the reigns of Constantine and Julian.

ISTHMUS CANALS. See INTEROCEANIC CANAL.

ISTHMUS OF DARIEN. See DARIEN.

ISTHMUS OF SUEZ. See SUEZ.

ISTIP, a t. of European Turkey, in Roumelia, on the Istip river; pop. 8,000. It is well built, and has a large trade. It contains some steel-works and the remains of an old castle.

ISTRIA, an Austrian margraviate, which, with the county of Görz and Gradiska, and the town and territory of Trieste, forms the Austrian crown-land of the coast-districts or Küstenland. It consists of a peninsula projecting into the n.e. corner of the Adriatic sea, together with the adjacent Quarnero islands.

ISTRIA (*ante*), anciently *Histria*, a peninsula of s. Austria, projecting into the n.e. part of the Adriatic sea, and including some islands; between lat. $40^{\circ} 35'$ and $45^{\circ} 50'$ n. and long. $13^{\circ} 23'$ and $14^{\circ} 40'$ e.; 1908 sq.m.; pop. 254,905. The peninsula is 50 m. long, with an average breadth of 30 miles. A ridge of rocky mountains runs through its entire length, the highest point of which is Monte Maggiore, 4,200 ft. above the sea. The coast is rugged and rocky and has many excellent harbors. The soil is well adapted to vines, olives, and other fruits. In the mountains herds of cattle find pasture, and marble and freestone are quarried. The fisheries and salt-works furnish employment to many of the people. The Istrians belonged to the stock of Illyrians, and like them were pirates. The Romans subdued them first about the beginning of the 2d c. B.C., and reconquered them in the following century. Their independence was finally overthrown by C. Claudius, 177 B.C., their country, united to Italy, continuing subject to Rome till it fell into the hands of the Goths in the 6th century. The eastern emperors, drove out the Goths and retained the country till the 10th and 11th centuries, when it became subject to Carinthia and Dalmatia. The Venetians in the 13th c. seized the western part, and Austria the eastern, both of which on the overthrow of the Venetian republic, 1797, were by treaty made over to Austria. From the downfall of Napoleon in 1813 till 1849, Istria formed a part of the government of Trieste.

ISVORNIK'. See ZVORNIK.

ISWARA (from the Sanskrit *is'*, to possess power, hence literally, *lord*) is an epithet applied to different Hindu divinities, but in mythological acceptation mostly designates Si'va (q.v.).

ITACOLUMITE, a peculiar, siliceous, metamorphic schistose rock, found accompanying talcose slates and schists, composed principally of quartz grains with hydrous mica, which latter mineral makes it flexible, whence it is called flexible sandstone. Its flexibility is peculiar, bending as though made of short joints. It is found in Brazil, the Ural mountains, Georgia, North and South Carolina, and elsewhere, particularly in sections of these regions where there is gold. It has been observed by Lieber that in South Carolina itacolumite passes gradually into sandstone and conglomerate, showing its sedimentary origin.

ITALIAN ARCHITECTURE. This term is usually limited to the style practiced by the Italian architects of the 15th, 16th, and 17th centuries, and which has since been adopted in every country in Europe. This style originated in a revival of the ancient architecture of Rome. Although Gothic architecture had been practiced in Italy during the 13th and 14th centuries, it had never been thoroughly naturalized. The Italians always showed a preference for the round arch over the pointed northern form; and even in the buildings they erected in the pointed style, there is a certain simplicity and largeness of parts indicative of a classic feeling. As early as 1350, Giovanni Pisano, in the beautiful sculpture of the pulpit at Pisa, showed a return to the ancient models. Arnolfo di Lapo built the cathedral of Florence (1290-1300), and in his design proposed a great dome (a remarkably Roman feature) over the crossing of the nave and transept. This he did not live to complete; but he prepared the way for Brunelleschi, the chief aim of whose life was the accomplishment of the great dome of the cathedral. He went to Rome to study the ancient buildings there, at that time neglected and hardly known to the Italians themselves. After devoting a considerable time to exploring these monuments, he returned to Florence; and, after great opposition, succeeded in carrying out the construction of the dome as it now stands. From this time, the revival of Roman architecture went on rapidly. It was encouraged by the popes and other princes of Italy; and the invention of the printing-press soon spread a knowledge of the works of the Italian architects over Europe. At first, the Roman moldings and ornaments only were copied and applied to the existing forms. As the ancient style became better understood, its general principles were gradually adopted, until at length the

modern Italian style was formed. This style may be defined as ancient Roman architecture applied to the forms and requirements of modern buildings. It has been admirably applied to domestic, but it has never been so successfully used in ecclesiastical edifices. The domes of the Italian churches render the interiors of these buildings very impressive, and are a feature for the introduction of which into the w. of Europe we are indebted to this style; but the façades of the churches are broken up into stories, and want the unity of a Gothic front.

Italian architecture is divided into three styles or schools, according to the places where it was practiced—viz., the Florentine, Roman, and Venetian. The Florentine buildings are massive and grand in effect; they are indebted to ancient Roman art chiefly for details, the outlines being the same as those of the older buildings, formed to suit the requirements of the place. Florence being a turbulent city, every man who had anything to lose had literally to make his house his castle. Accordingly, the basement floor is massively built with large blocks of stone, and the windows are small and plain. The Roman school naturally resembles more closely the ancient Roman buildings so numerous in that city—pilasters, arcades, etc., being freely used. In Rome, the plan of including two or more stories in one *order* of columns or pilasters with their entablature, with an attic or low story above, first originated, and was afterwards extensively, but, as already explained, not successfully applied to churches.

The Venetian style is, as might be expected in a city long accustomed to elegant palaces, the most ornate and picturesque of the Italian schools. Venice is crowded with specimens of all kinds from the earliest to the latest renaissance, and retains its individuality of style from first to last. Each story is marked by a separate tier of columns or pilasters with their entablature; the windows are arched and ornamented with columns, and the spandrels commonly filled with figures. The outline is varied in form, and is usually finished with a balustrade, broken by pedestals, and crowned with sculptured figures. It is from this most picturesque of the styles of the Italian renaissance that the other countries of Europe derived their peculiar forms. See RENAISSANCE, ELIZABETHAN, CINQUECENTO.

ITALIAN WINES. The wines of Italy are not very highly valued in other countries, and almost the whole quantity produced is consumed at home. Those of the n. are for the most part disagreeably acid, and scarcely any one of them can be preserved beyond one year. The vines are grown not so much in vineyards as in the hedgerows—a system which doubtless injures the quality of the wine. In the southern parts, however, where the vines are grown in low vineyards as in France, the wines are of a more fiery quality, and though prepared with little care, they require only to be better known to be esteemed by foreigners. A great variety of wines is produced in Piedmont, and those of Asti and Chaumont have acquired a reputation. The so-called Malvasia wines of Sardinia are produced at Sorsogna, Posa, Alghiere, and Naxo. The Malvasias of Caunonas, Monai, and Garnaccia are exported. The best Italian wines, however, are produced in Tuscany, partly because the climate is most favorable, partly because the former government and many nobles paid great attention to the improvement of the vineyards. Of vines, the Aleatico, or red muscat, is most extensively grown, at Monte Pulciano, between Sienna and Rome; at Monte Catini, in the Val de Rievole, and at Ponte a Moriano. The wine is purple in color, sweet, and slightly astringent in taste. A good red wine is made at Chianti, near Sienna, from a peculiar grape. The wines of Artimino, a former grand-ducal estate, and of Carmignano, are also of good quality. At Arcetri, near Florence, was prepared the best Verdea, or green wine, so called from its color, and much esteemed by Frederick the great of Prussia. Another celebrated wine is the Trebbiano, a gold-colored syrup. From the Venetian plain the cultivation of the vine extends into many of the valleys of the Alps which open into it, particularly that of Udine, the valley of the Tagliamento, up to Tolmezzo, and the Piave. In many of these valleys viticulture might attain the highest perfection if it were directed to quality, and if selected vines were grown in closed vineyards with that care and attention which are bestowed upon this branch of production on the Rhine and in France. The former Papal states of central Italy produce the wines of Orvieto, and the muscats of Albano and Montefiascone. Lachrymæ Christi is produced from vines grown at the base of Mt. Vesuvius, and is reputed to be the strongest of the wines in the Naples district. The province of Puglia or Terra d'Ortranto produces the wines of Gallipoli and Taranto. Of Sicilian wines only one variety is exported in large quantities, namely, the white or light amber or brown wine, which goes under the name of the exporting town of Marsala. In the neighborhood of Messina there is grown the Faro wine, reputed to be the strongest wine of n.e. Sicily. Near Mt. Etna is made the wine of Terre Forte, in the vineyards of the Benedictine monks.

ITALIC VERSION (*Vetus Itala*), the name given to a translation of the Scriptures into Latin, which preceded the Vulgate. Its origin is commonly supposed to date from the middle of the 2d century. The Italic version was in general use down to the time of Jerome, who, being dissatisfied with the imperfections which it exhibited, undertook to revise and amend it, but ultimately produced the new translation known as the Vulgate (q.v.). The Italic version of the Old Testament was made, not from the Hebrew, but from the Septuagint.

ITALY. The geographical territory comprised under the name of Italy consists of a considerable stretch of peninsular mainland, closely resembling a boot in shape, besides several islands, situated in southern Europe, between lat. $36^{\circ} 35'$ and 47° n., and between long. $6^{\circ} 35'$ and $18^{\circ} 35'$ east. From the southern extremity of Sicily to the Alps its maximum length is about 600 m., its utmost breadth being 300 miles.

Boundaries.—Its boundaries on the n. are Austria and Switzerland, on the s. the Mediterranean, on the w. France and the Mediterranean, and on the e. the Ionian and Adriatic seas; while its natural limits are strongly defined by the Alps and the sea.

Area.—The kingdom of Italy—which comprises the whole peninsula, with the small exception of the republic of San Marino—has an area of about 110,000 sq.m., and was estimated to have in 1875 a pop. of 27,482,174. At the census of 1871 the figures were as follows:

PROVINCES.	Area in English Sq. Miles.	Population in 1871.
1. Alexandria.....	1,951.73	683,473
2. Cuneo.....	2,755.24	615,930

Physical Aspect.—The physical aspect presented by the surface of Italy is diversified in the extreme. Northern Italy is, for the most part, composed of one great plain—the basin of the Po, comprising all Lombardy and a considerable portion of Piedmont and Venice, bounded on the n.w. and partly on the s. by different Alpine ranges. Throughout central Italy, the great Apennine chain gives a picturesque irregularity to the physical configuration of the country, which in the southern extremity of Italy assumes still wilder forms. In the highland districts of Naples, in which the Apennine ridge reaches its maximum elevation (10,000 ft.), the scenery exhibits a savage grandeur. Along the extensive coast-plains, as well as in the sub-Apennine valleys, the rural charms of this portion of Italy are extreme, while the brilliant flora and vegetation impart to it a novel character of beauty. The chief mountain-system of Italy is the frontier ridge of the Alps (q.v.), and its noble continuation the Apennines (q.v.).

Volcanic Zone.—Italy likewise comprises a considerable stretch of volcanic zone, which traverses the peninsula from the center to the s. parallel with the Apennines, and of which the most remarkable active summits are Vesuvius, near Naples; Etna in Sicily; and Stromboli in the Lipari isles.

Plains.—The great plains of Italy are those of Lombardy, which stretch from the Mincio to the Ticino and the Po; of Piedmont; the Venetian plains; the plain of the Roman legations; the plain of the *Campo Felice*, on which stands Vesuvius; the Apulian plain; the long, narrow Neapolitan plain of the Basilicata, 100 m. in length and 24 m. in breadth, stretching along the gulf of Tarento.

Rivers.—The great majority of the rivers of Italy are only navigable for small coasting boats or barges. By far the most important is the Po (q.v.), which rises on the borders of France, and flows into the Adriatic. It has numerous tributaries. Among the others may be mentioned the Adige, Brenta, Piave, Tagliamento, Aterno, Sangro, Metauro, Ofanto, Bradano, also belonging to the Adriatic basin; the Arno, the Tiber, the Ombrone, the Garigliano, and the Volturno, which belong to the Mediterranean basin. The classical and historical associations of many of the Italian streams, even when mere rivulets, invest them with perennial interest.

Canal System.—The canal system of Italy is most extensive in the north. Nine principal canals in Lombardy administer to the irrigation of the plains, and to the purposes of commercial communication, contributing in no small degree to the prosperity of the district. The *Naviglio Grande* or Ticinello is the finest hydraulic construction in Italy; it communicates between the Ticino and Milan, and has a course of 28 m. navigable for vessels of large size. It was begun in 1179. The *Naviglio Martesana*, 38 m. long, unites Concesa on the Adda with Milan; the *Naviglio di Pavia* is 18 m. in length; the bifurcated *Naviglio d'Ostiglia* unites the Po with the Adige. Two hundred and fifty-three canals intersect Piedmont, extending over a length of 1932 kilometers. Venice comprises 203 navigable and 40 minor canals. Numerous canals have been constructed for the drainage of the Pontine Marshes. This system of water-communication was early carried to a high degree of efficiency in Italy, and is of incalculable service in the agricultural districts.

Lakes.—The mountain lakes of Italy are famed for their picturesque beauty. They are mostly in the northern provinces of Lombardy and Venetia. The principal are Maggiore, Lugano, Como, Iseo, and Garda. The Roman lakes of Perugia, Bolseno, and Bracciano, that of Castiglione in Tuscany, and Celano in Naples, also deserve mention.

Springs.—The mineral and thermal springs of Italy are innumerable, and possess a great variety of curative and sanitary properties.

Climate.—In the northern provinces, the climate is temperate, salubrious, and frequently severe in winter; in the center, it assumes a more genial and sunny character,

while the heat of the southern extremity is almost of a tropical intensity. The singular clearness of the atmosphere sets off the landscape and monumental beauties of Italy with brilliant effect. The drawbacks of Italy's climate are the piercing tramontana or mountain winds; the deadly sirocco, which blights all nature at seasons along the western coast; and the malaria or noxious miasmata which issue from the Maremma of Tuscany, the Pontine Marshes, and the Venetian lagoons, generating pestilential fevers and aguish diseases in the summer season. The mean temperature of the leading divisions of the country throughout a whole year was as follows: Milan, $55^{\circ} 4'$ of Fahrenheit it's scale; Rome, 59° ; Palermo, $62^{\circ} 5'$; and in Sardinia, $60^{\circ} 5'$. The highest temperature at Rome rises to 95° , and in Sicily from 97° to 104° .

Products.—The staple products of Italy are corn, wine, oil, raw silk, rice, olives, and fruits, besides hemp, flax, cotton, which are largely grown, and even the sugar-cane is successfully cultivated in Sicily and the south. Agriculture, however, except in the n., is in a very backward condition. Nevertheless, the annual yield of cereal crops is considerable, and not only suffices for home consumption, but likewise for foreign export. The northern provinces or great plains, Tuscany, and the islands of Sardinia and Sicily, furnish most of the grain of Italy. The minor alimentary products are beans, peas, Indian corn, lupines, and chestnuts, which are largely used. The wines of Italy are very numerous, but owing to the defective mode of their manufacture, are unfit for exportation, as they can neither bear transport, nor do they improve by age. The wines of Naples are esteemed the best, small quantities of the famous *Lacrima Christi* and the *Vino d'Asti* being exported, while the Sicilian wines of Marsala form a considerable export trade. The most superior oil and olives are furnished by Tuscany, Lucca, and Naples; the oil of Florence, and that of Gallipoli and Puglia, being unequaled for purity and sweetness. Silk is chiefly manufactured in the northern provinces, the cultivation of the mulberry and the rearing of the silk-worm forming in Lombardy a principal occupation of the population. In Lombardy alone, upwards of 17,000,000 mulberry-trees are required to furnish food for the worms; and the silk exported from the Lombardo-Venetian provinces alone yields an annual revenue estimated at about £5,000,000. The best manufactured silk comes from Piedmont, Tuscany, and the Roman provinces. The cotton-plant is grown extensively in Sicily, and yields annually about 2,000,000 lbs., which is manufactured in the native looms of Tuscany, Piedmont, Lombardy, and Rome. The fruits of Sicily and the s. are exquisite in flavor, and embrace several tropical species. Oranges, lemons, almonds, figs, dates, melons, and the pistachio-nut are common to all orchards, and are largely exported. A considerable cheese-trade exists in the northern provinces, that of Lombardy alone yielding a revenue of more than £2,000,000. Italy also furnishes various valuable substances, such as sulphur, alum, etc. All the domestic animals of western Europe are to be found in Italy, besides buffaloes and camels, which are not uncommon. The fauna of Italy includes most of the British species, besides the wolf, lynx, boar, marmot, vulture, ibis, flamingo, and pelican. On the coast of the southern provinces are to be found many species of African water-fowl. The *ortolano* and *beccafico* are small birds, much esteemed for their flavor. The nocturnal fire-flies are a remarkable feature of insect life.

Fisheries.—The sea and fresh-water fisheries of Italy are considerable; the Mediterranean furnishing immense quantities of tunny, anchovies, sardines, mullet, pilchards, and mackerel. The export of anchovies and sardines is of vast extent. The river-fisheries yield salmon, trout, sturgeon, lampreys, tench, and barbel, etc.; and the lagoons contain excellently flavored eels. See COMMACHIO. The crustaceans and shell-fish of the Italian seas are of great variety and delicate flavor, and are a favorite article of Italian consumption.

Exports.—Among the exports of Italy may be noted raw silk, rice, fish, fruits of various kinds, marble, alabaster, sulphur, alum, silks, velvets, cloth of gold and silver, perfumes, mosaics in stone and wood, carvings in wood, macaroni and similar culinary pastes, porcelain, majolica, preserved fruits and meats, musical instruments, jewelry, and objects of art.

Army and Navy.—Recent statistics of the military and naval force of the kingdom of Italy give the following numbers: On July 1, 1875, the army comprised a total of 409,426, commanded by 13,694 officers, not included in the number given above. The staff numbered 1430; infantry, 220,799; depots, 25,965; bersaglieri or sharp-shooters, 37,402; cavalry, 34,106; artillery, 48,248; corps of engineers, 9,618; carbineers, 20,970; local troops, 1614; sanitary service, 3,217; divers establishments, 7,487. If we take into account the provincial militia and the reserve of the regular army, the total war-roll of Italy amounted in 1878 to 1,215,000 men. In Sept., 1876, the Italian fleet consisted of 47 war-vessels and 19 transports—66 in all, carrying 339 guns, with a force of 10,470 sailors and marines; besides 1075 officers of all grades.

Finances.—The revenue of the kingdom of Italy, for the financial year 1877, was £55,936,400; the expenditure was £55,624,300, leaving a surplus of £312,100. The interest of the public debt payable in 1876 was no less than £19,753,330.

Railways, etc.—In 1877 Italy had 4,934 m. of railway in operation, besides 420 in construction. They were 3,010 post-offices, and about 49,000 m. of telegraphs.

Religion.—The dominant form of religion of Italy is the Roman Catholic. The

Protestants are chiefly in the Waldensian valleys of Piedmont, and number only about 59,000. There are also 35,000 Jews. Political rather than theological reasons, however, before the abolition of the temporal power, brought the papacy into great disrepute among the progressive and national section of the country. Freedom of worship used to be denied to native Protestants by all the states except Piedmont; but since the late political changes of Italy, freedom of religious belief is encouraged by the government. The Roman Catholic clergy are estimated at 7 in the 1000 of the entire population. The church revenues of Italy have suffered considerable diminution, owing to the suppression of several orders, and the enforced sale of their lands by government.

Education.—The mass of the Italian people are incredibly illiterate; the primary elements of education, reading and writing, are by no means universal even among the better classes. A great educational impulse, however, has been imparted to all the recently united states, in which new public and endowed schools are daily being inaugurated. Normal schools, on the British principle, have been founded for the training of Italy's future teachers. The government has devoted to the cause of education a great part of the confiscated property of religious orders. Besides this, £600,000 is annually voted by parliament for education. The universities of Italy are numerous, many of them being of ancient date and European fame. There are in all 21 universities, of which 17 are supported by the state, and have near 10,000 students, the other four being provincial. The most largely attended are those of Naples (2,500 students in 1877), Turin, Padua, Pavia, Rome, Bologna, and Pisa.

History.—The ancient history of Italy will be more conveniently treated of under ROME; see also ETRURIA, UMBRIA, etc. We proceed to the dawn of modern history. The western Roman empire fell before a mixed horde of barbarous mercenaries, chiefly composed of the Heruli, who proclaimed their leader, Odoacer, king of Italy (476 A.D.). After 13 years of military despotism he was slain, and his followers vanquished by the Ostrogoths, led by their great king Theodoric. The Ostrogoths (see GOTHS), in their turn, were vanquished (552 A.D.); and Italy was then governed by an *exarch*, or delegate of the emperor of Constantinople, whose seat of government was Ravenna. Narses, the first exarch, having been disgraced, in revenge invited the Lombards to invade Italy (568); and under their rule the ancient political system of northern Italy was superseded by the introduction of feudal and Teutonic institutions. The Lombards, in their turn, were conquered by Pepin (754) and Charlemagne (774), the latter of whom was crowned emperor of Italy. The Lombards, however, retained the great duchies of Benevento, Spoleto, etc., till the advent of the Normans. In 842 the Saracens invaded Italy, and took possession of many important places on the southern coast, which they held till 1016, when they were driven out by the Normans. On the fall of the Carlovingian dynasty (888), the crown of Italy fell to Berengarius I., chief of the Friuli, whose descendant, Berengarius II., did homage to Otho I. of Germany as his lord paramount (951); and in 961 Otho deposed his vassal, and assumed sovereign rights over the Italian kingdom. From this period the chief towns of Italy rapidly emerged from their previous insignificance. A foremost object of Otho and his successors was the abasement of the papacy; and for a time these emperors successfully arrogated to themselves the right of nominating to the chair of St. Peter the candidate most attached to imperial rule. The accession of Konrad was the signal for various tumultuous risings of the Italians against their German rulers, who had grown the object of general detestation. Important feudal modifications during this reign tended still further to weaken the great feudal lords, and to exalt the inferior vassals and citizens. Under the reign of his successor, Henry III., we find the spirit of association, alike for offense or defense, waxing strong in Italy. The aggrandizement of the great Guelphic house of Este (q.v.), the bloody wars of the investiture (q.v.), and the establishment of an ameliorated form of municipal government (1100), are the three most notable events that occurred under the Franconian dynasty.

Under the Hohenstaufen dynasty Italy enjoyed an interregnum from foreign rule of about 60 years, which, however, was wasted in suicidal conflicts between the two factions of the Guelphs and Ghibellines. The most terrible incident of this period was the massacre of the Sicilian vespers (q.v.). Notwithstanding the inveterate internecine feuds of Italy, it was a period of great splendor and prosperity. The free cities or republics of Italy rivaled kingdoms in the extent and importance of their commerce and manufactures, the advancement of art and science, the magnificence of their public edifices and monuments, and the prodigious individual and national wealth to which they attained. Unhappily, a spirit of rivalry and intolerance grew up during this period of mediaeval splendor, and in the arbitrary attempt of these states to secure supremacy over each other, they gradually worked their own destruction.

From the Sicilian Vespers (1282) to the reign of Henry VII. (1308), the chief historical incidents are the war between Genoa and Pisa, ending in the abasement and ultimate decline of the latter (1284); the quarrels of the Guelphic factions, the Bianchi and the Neri, in Tuscany; the papal efforts for their reconciliation (1301); the residence of the popes at Avignon (1304-1377); and the rise into importance of the oligarchic republic of Venice (1311). During the first half of the 14th c. the German emperors made several fruitless attempts to regain political supremacy in Italy; but in 1355 the emperor Charles IV. gave up the struggle.

The tyrannical rule of several petty tyrants, of which the foremost were the Visconti or lords of Milan, replaced that of the emperors. From the middle of the 14th c. to the end of the 15th, the collective history of Italy ceases, each city being ruled by some powerful local family—as, for example, Verona by the Della Scala, Padua by the Carrara, Ferrara by the Este families, and Mantua by the illustrious princes of Gonzaga; Milan by the Della Torre, Visconti, and Sforza families. See also GENOA, PISA, FLOR-ENCE, VENICE, NAPLES, etc.

From 1495 to 1525 Italy was the theater of the sanguinary struggles between France, the native rulers, and the Hapsburgs, but the battle of Pavia (1525) thoroughly established the ascendancy of the German emperor, who appointed over the various states rulers of his own selection. During the 17th c. no events of note mark the history of Italy; the country being at peace, the various states pursued commercial traffic and industry, as far as their decreased limits permitted. In the following century some territorial changes were effected during the war of the Spanish succession. In 1793 Italy partially entered the European coalition formed against France, whose arms, however, proved irresistible. By the treaty of Campo Formio, Oct. 17, 1797, the entire state of Venice was transferred to Austria, while the rest of the country, under various designations, became for the most part a dependency of France. In this anomalous condition it remained during the rule of Napoleon. After the battle of Waterloo the final reconstitution of Italy was decreed as follows by the congress of Vienna: the kingdom of Sardinia reverted to the house of Savoy, to which were added all the provinces of the Genoese republic; the Lombardo-Venetian kingdom fell to Austria; the principalities of Modena, Reggio, and Mirandola, to which was soon annexed Massa and Carrara, were restored to the family of Este; Lucca was created a duchy for the rightful duke of Parma, whose hereditary state was conferred on Maria Louisa, ex-empress of the French; the duchy of Tuscany was restored to the Austro-Lorraine dynasty; the papal states to the pope; the kingdom of Naples to the Bourbons; while the petty state of San Marino was allowed to retain its republican form; and Monaco remained an independent principality under the prince of Valentinois.

By the congress of Vienna Italy was again cast at the feet of the papacy and of Austria, and this at a period when progressive aspirations were strongly reawakened in the Italian people. The system of resolute oppression adopted by the reinstated rulers speedily produced an irreconcileable hostility between themselves and their subjects, and a net-work of secret societies for the organization of national resistance spread throughout the entire land. The first-fruits of their organization were the risings of 1820 and 1821 in Piedmont and Naples, to demand constitutional rights. Austrian intervention quelled both these movements; and in 1831, when a similar rising occurred in Modena and the Roman states, it was subdued with sanguinary ferocity by an Austrian army. In these movements no distinct tendency towards national unity is perceptible; and only on the accession of Charles Albert to the throne of Piedmont (1831) was this grand idea of modern Italy propounded by Joseph Mazzini in an address to the king, urging him to assume the rôle of liberator and leader of Italy. The king of Piedmont, by yielding in some degree to the spirit of his time, prepared for Piedmont pre-eminence throughout the country. The accession of Pius IX. in 1846 seemed the inauguration of a new era for Italy: a general amnesty was followed by wise, liberal measures, which were also adopted by Tuscany and Piedmont, in emulation of Rome. Naples and the other states resolutely refused every measure of reform, and by a simultaneous outbreak in Sicily and Milan in Jan., the great revolution of 1848 was inaugurated in Italy. The revolution of France in Feb. imparted a strong impulse to that of Italy, and speedily Naples, Piedmont, and Rome conceded constitutional rights to the popular demands. The Milanese unanimously revolted against Austrian rule on Mar. 17, and after five days of heroic fighting, the Austrians were expelled from the city, and Radetsky, with 70,000 troops, compelled to retreat from its walls. On the 29th Charles Albert entered Lombardy, the avowed champion of Italian independence, and the leader of the national struggle. All the sovereigns of Italy contributed their best troops for the war, and on the Roman volunteers setting out for Lombardy, the pope himself in public pronounced a solemn benediction on their banners.

But ere a month had elapsed Pius IX. suddenly halted in his career of liberator of Italy, and abandoning the national cause, launched (April 19) a severe censure against "this unjust and hurtful war," which, chiefly by his own benediction, had been consecrated in the eyes of at least the more ignorant of the people. The recall of the Neapolitan troops was the first-fruits of the encyclical letter, which may be considered the tocsin of the subsequent fierce reaction through all Italy. For a time, however, the revolution made way; at the close of the year Rome became agitated; the pope fled to Gaeta; and on Feb. 8 the Roman republic was proclaimed under the presidency of Mazzini. On the same day the grand duke of Tuscany abandoned his state. Piedmont again assumed the lead, but the disastrous battle of Novara (Mar. 23) finished the national Italian war of 1848. The treacherous French expedition against the Roman republic, and the return of the pope in 1850, are the concluding acts of this great revolution.

The reaction was complete and merciless in every state save Piedmont, the king of which kept faith with his subjects, and observed the constitutional forms conceded in

1848. Austrian troops exercised a crushing tyranny, and from time to time Europe shuddered at the recital of the dark cruelties practiced in the dungeons of Naples and Rome. In the congress of Paris, at the close of the Russian war (1856), Cavour (q.v.) forcibly exposed the unavoidable dangers of a continuance of Austrian and Papal misrule. He strongly urged the expediency of a withdrawal of French and Austrian troops from Rome and the legations. In the beginning of 1859 Victor Emmanuel proclaimed from the Sardinian parliament his intention of actively aiding in the deliverance of the oppressed Italian population from the yoke of Austria. Towards the close of the year Sardinia and France jointly prepared for war with Austria, and in April, 1859, the war commenced. The victories of Magenta and Solferino were quickly followed by the abrupt and inconclusive peace of Villafranca, July 11, 1859, by which a confederation of the Italian states with the papal protectorate was proposed as the best solution of Italy's difficulties. The whole of Italy energetically rejected the scheme; and early in 1860, the various states whose sovereigns were in flight from the Lombard campaign voluntarily declared in favor of annexation to the kingdom of Piedmont. On March 18 Parma, Modena, and the Emilian provinces were incorporated with Sardinia; and the grand duchy of Tuscany on the 22d. On March 17 the law by which Victor Emmanuel assumed the title of king of Italy was promulgated amidst universal rejoicings. On March 24 the provinces of Nice and Savoy were ceded to France. On the 6th of the ensuing May Garibaldi, with about a thousand volunteers, set sail from Genoa for Sicily, where a revolutionary outbreak had taken place. His swift and comparatively bloodless conquest of the Two Sicilies is one of the most extraordinary incidents in modern history. Meanwhile, the Sardinian generals Cialdini and Farini having advanced into the papal provinces, the papal forces under Lamoricière were routed at Castelfidardo, which was followed by the capture of 4,000 prisoners at Loretto, and the surrender of Lamoricière at Ancona. Thence the Sardinian forces marched into the Abruzzi, while Victor Emmanuel proceeded in person to Naples. On Nov. 7, at Teano, Garibaldi unconditionally relinquished to his sovereign the southern provinces liberated by his genius and valor. Umbria and the march of Ancona were next incorporated with the kingdom of Italy. The kingdom of Italy was formally recognized by all the great European powers, with the exception of Austria. On the death of Cavour, June, 1861, the ministry of Baron Ricasoli was formed, but after a brief term of office was succeeded by that of Ratazzi, March 31, 1862, whose avowed subserviency to the French empire created considerable alarm amongst the liberals of Italy. One of its earliest acts was the incorporation of the southern volunteer forces with the regular army. On the 9th and 10th a great aggregate meeting of deputies from all the liberal clubs of the kingdom was held under Garibaldi's presidency; and on the 20th, having previously been entertained at a grand banquet by the royal princes, he set out on his almost triumphal tour throughout Italy, with the view of organizing rifle clubs amidst the youth of all the chief cities. An apprehension on the part of the government that Garibaldi contemplated an armed expedition in aid of Venice led to stringent and unlooked-for measures of repression. Ministerial orders were next transmitted to Garibaldi, prohibiting any further organization of the rifle societies. On June 20 Garibaldi arrived in Turin, and on the 28th landed at Palermo, in Sicily, where he met with a warm reception from prince Humbert, the heir-apparent of the Italian crown. On July 4 the ministry was seriously disturbed by the warmth with which Garibaldi denounced the French occupation of Rome. On the 7th a grand review at Palermo was held in his presence. Volunteers speedily hastened to join him, with the avowed intention of proceeding to Rome, despite the royal proclamation, which accused them of rebellion against their sovereign. A special message, accompanied by the royal proclamation, was forwarded by the king to Garibaldi, who, under the impression that he possessed the covert approbation of the sovereign, declined to desist in his expedition to Rome, but expressed his unshaken sentiments of loyalty to the king. On Aug. 22 Sicily was declared in a state of siege, the liberal clubs were dissolved, and an armed force dispatched to pursue and disperse the volunteers. Garibaldi reached Catania on the 18th, and some days later succeeded in effecting a landing on the coast of Calabria with the greater part of his followers. Gen. Cialdini having been appointed commissioner extraordinary in the island of Sicily, with full powers over the civil and military authorities, proceeded to the most stringent measures to effect the capture of Garibaldi. The "affair of Aspromonte," in which Garibaldi's small force of volunteers were compelled to surrender, their heroic leader ordering them not to fire on the royal troops, put an end to the semblance of revolution. The wounded chief was conveyed as a prisoner to the fortress of Varignano, at Spezzia. The amnesty granted to him and his followers by the Italian monarch enabled him to proceed to Pisa, whence he returned to his island home of Caprera.

On the meeting of the houses of parliament, the ministry of Ratazzi had to sustain a formidable attack from the liberal members, who demanded the impeachment of the premier and his colleagues. Ratazzi, finding himself unsupported by any section of the house, after an unavailing defense, resigned his portfolio on Dec. 10, and was succeeded in office by signor Farini (q.v.).

At the close of the German-Italian war (see GERMANY), Venetia, on Oct. 3, 1866, became part of the kingdom of Italy by treaty with Austria. Turin, the chief town of

Piedmont, was the capital from 1859 till 1865; the court was transferred to Florence during the latter year. In 1867 the French army began to be withdrawn from Rome, and the national aspiration to have the Eternal City as capital of the kingdom of Italy seemed now near its realization. Some of the French troops remained at Rome until the urgent necessities of the Franco-Prussian war compelled the emperor Napoleon to withdraw them. The last detachment left the pontifical territory on Aug. 8, 1870; and on the 20th of the following month, the Italian troops, under gen. Cadorna, entered Rome after a short resistance by the pontifical troops, who ceased firing at the request of the pope. On Oct. 2, 1870, the kingdom of Italy assumed the last of its extensive limits, when the whole of the papal states were absorbed by it, and Rome was its reeognized capital; and thus were realized the aspirations of many generations, the dreams of Mazzini, and the policy of count Cavour.—The last seven years of Victor's reign were uneventful, but were marked by the further consolidation and progress of the kingdom; and after his death (in Jan., 1878) his policy was maintained by his son Humbert. See Sismondi, Macchiavelli, Guicciardini, Denina, Botta, Balbo, and other historians.

Italian Language and Literature.—The Italian language, the most musical of all the tongues of Europe, is descended from the Latin, and there have been various opinions as to the way in which the transition took place. In the view, however, of the scientific students of language, there is nothing special in the case; the changes are sufficiently accounted for by that tendency to phonetic decay or corruption which is always at work in a living tongue, and which is especially active in a chaotic and transition state of society like that of Italy at the downfall of the Roman empire. The already corrupt dialects of the uneducated become predominant, and being released from the fixing influence of a written literature, depart more and more from the grammatical standard; and in the case of Italy, the barbarian intruders would, to a still greater degree, mutilate the Latin, and introduce multitudes of words from the northern tongues. For some centuries this corrupting process went on, in the course of which the Latin gradually divested itself of its original classical peculiarities and degenerated into the impure or vulgar form known as the *Romana rustica*, or *lingua Romanza*, which became the prevailing language of the various races of south-western Europe, and received from each some of the most salient characteristics of their own native dialects.

This "rustic Latin" may be termed the direct offspring of Latin, and the parent of Italian; in the compositions of the Provençal poets, we find one form of it elevated to the rank of a polished, or *illustre*, written language as early as the 10th c., while the form which prevailed in Italy continued as late as the 12th c., an uncouth and vulgar dialect, contemptuously excluded from all learned composition. In the Sicilian court of the Hohenstaufen emperor, Frederick II., the Italian dialect was first rescued from this state of degradation; adopted by this monarch as the choice language of his court, it became the medium of his own and his son's literary and poetic creations, while his learned friend and secretary, Pier delle Vigne, may be termed the earliest Italian poet; his odes and canzoni, composed a hundred years before Dante, are written in wonderfully pure Italian. The university of Naples, and several of the Sicilian schools, were founded by Frederick, whose cultivated and enlightened court became the center of the letters and learning of Italy, and the abode of the best intellects of the time. Here, Italian reached a considerable degree of refinement and correctness, and received the name of the aulic (court) or of the Sicilian language.

Poets have in all ages been the elevators and guardians of language; and we find Italian in the 12th and 13th centuries honorably employed by the poets of the age, especially by those of Tuscany, whose own oral dialect soon took precedence over all the others in polished expression and grammatical accuracy. The chief Italian poets of this age are Guido Guinelli, Guido Ghisilieri, Fabrizio and Onesto of Bologna, Guido Lapo of Mantua; and the Tuscan poets, Guittone d'Arezzo, Bonagiunta da Lucca, and Brunetto Latini Fiorentino, the illustrious preceptor of Dante. Fra Guittone, a member of the order of the Cavalieri Gaudenti, has left several compositions of merit, including sonnets and odes, but his most interesting literary legacy consists of 40 letters in prose, which are regarded as a valuable specimen of early Italian, being the most ancient epistolary composition in the language. The writings of these early poets possess more linguistic than poetic interest, and are to be found in various collections, chiefly in the *Rime Antiche* (1518), the *Poeti Antichi* by Alacci (1661), and the modern work of Rannucci, *Manuale della Letteratura del Primo Secolo* (Florence, 1837, 3 vols.). Brunetto Latini (1260), the preceptor of Dante, was reputed "a man of great sense and science." His work, *Il Tesoro*, is a marvel of heterogeneous knowledge. *Il Tesoretto* is a curious compendium of moral precepts, and *Il Pataffio* a still more curious production, the obscene levity of which earned for him a place in the *Inferno* of his pupil. Guido Cavalcanti, the cherished friend of Dante, was more of a philosopher than a poet. Italian also began to be now adopted as the vehicle of learned and scientific prose. The historical chronicles of Matteo Spinola, a Neapolitan, are the oldest specimen of Italian prose literature (1247-68); but the Florentine Malespini (died about 1280) is the first historical writer whose style is elevated and polished. In short, contemporary with the appearance of Dante (q.v.), the Italian dialect was rapidly super-

sedding Latin in grave prose composition, as well as in poetry, and soon became the recognized oral and written polite language of the entire country, while various local dialects were preserved in use amongst the illiterate classes of the people. It has been finely observed that Dante found the Italian language in its cradle, and exalted it to a throne; the *Divina Commedia* imprinted on the Italian tongue a grave and majestic character, which at once qualified it to rank with the languages of Greece and Rome. The impetus imparted by Dante to the language and intellectual life of his country has continued to the present day.

The minor poets, Francesco Stabile, or Cecco d'Ascoli, burned by the church (1327), and author of *L'Acerba*, a critical attack upon Dante, and a wonderful mixture of learning, acuteness, and superstition; Francesco da Barberino (1264-1348); and Cino da Pistoja, the learned jurist and poet, whose work on jurisprudence, *Il Comento sul Codice*, and pleasing amatory verses, won for him the commendations both of Dante and Petrarch (1270-1336), claim mention before the great name of Francesco Petrarca (q.v.) (1304-1374), the creator of Italian lyrical poetry, and the enricher and perfecter of its language. The luster of Petrarch's fame, however, is not derived from his sonnets alone. Apart from their exquisite beauty and pathos, their classical elegance and simplicity of diction render them an abiding standard of Italian poetry. Italian, which, in its poetical capacities, we have seen created by Dante, polished and refined by Petrarch, was first molded into a perfect form of prose by the prince of novelists, Boccaccio (q.v.). The *Decamerone* is a series of tales, and Boccaccio's best known work. Boccaccio's style is deeply tinged by his culture of classical literature; and in his straining after the pompous majesty of Latin construction, he frequently exceeds the structural capabilities of his own language, which is naturally direct and simple in the order of its composition. Franco Sacchetti (1335-1400) of Florence, and Ser Giovanni Fiorentino (1348), also composed tales distinguished by the excellence of the language; while Dino Compagni and Giovanni Villani enriched the historical literature of Italy with excellent chronicles, written in a spirit of fairness, and with great beauty of style.

The 14th c. was lavishly productive of great original literary creations, the writers of that age, or *I Trecentisti*, according to their Tuscan appellation, being as distinguished for the sublime originality of their genius as those of the 15th c. were famed for their abstruse erudition and philosophy. Italian was the chosen language of the *Trecentisti*, and in their writings attained a high degree of refinement and purity. On the other hand, the scholastic writers of the 15th c. almost entirely excluded Italian from their works, substituting for the language of Dante and Petrarch a faulty form of Greek or Latin. To this circumstance may probably be attributed the languid development of literature during a period in which the most magnificent protection was afforded both by the pontifical and sovereign courts of Italy to the literature and art of the century, and when the discovery of printing imparted an impulse to the intellectual vitality of Christendom. Foremost among the encouragers of literature and art were the Medici at Florence; the Visconti, and, later, the Sforzas, at Milan; the houses of Gonzaga and Este at Mantua and Ferrara; the house of Aragon at Naples; and the pontiff at Rome. Marsilio Ficino, Pico della Mirandola, Leon Battista Alberti, are some of the most distinguished writers who discarded their mother tongue and adopted Latin; while a host of grammarians, historians, philologists, and theologians openly pronounced the *illustrious* Italian language a vulgar dialect, unfit for philosophical or learned composition. But this debasement of literary taste was happily of brief duration, and to Lorenzo de' Medici, entitled the "Father of Letters," is owing the literary revival of the Italian tongue. Under this princely patron of letters, arts, and sciences, public libraries were founded or replenished, learned societies inaugurated, rich antiquarian treasures collected, universities opened, and a true standard of literary truth and beauty once more set up. His friend and protégé, Angelo Poliziano, wrote elegantly both in Italian and Latin, and composed the first regular dramatic work in the former language, under the title of *L'Orfeo*. Towards the close of the 15th c. and the opening of the 16th, a taste for the romantic and heroic in poetry began to show itself. This taste was cultivated by Durante da Gualdo, by Luigi Pulci (q.v.) in his *Morgante Maggiore*, and by the still more famous Matteo Boiardo (q.v.), whose *Orlando Innamorato* evidently suggested the greatest of all the works of this kind, the *Orlando Furioso* of Ariosto. But by far the most important historical works of the time were written in Latin—for example, those of Silvio Piccolomini, Marc Antonio Sabellius (d. 1506), Bernardo Giustinianus (d. 1489), and Georgius Stella (d. 1480). During the century of scholastic erudition, the spring of Italian eloquence flowed with sluggish course until the impassioned and unstudied oratory of Jerome Savonarola (burned 1498) revived the traditions of ancient Rome, and reminded his hearers that Cicero too was an Italian.

The 15th c., though not marked by much creative genius in literature, unquestionably exercised an immense influence on the Italian mind. The revival of letters, the invention of printing, the discovery of a new world, and the opening up of a maritime channel to the wealth and traffic of the Indies, co-operated, one may say, in producing that wonderful development of art and enterprise which the succeeding age exhibited; while the advancement of learning and science was promoted and systematized by the

founding of numerous universities and literary institutions, the aim of these latter being the diffusion of general knowledge and sound practical science. Many of the magnificent typographical treasures with which the great public libraries of Italy abound, belong to this golden age, and are due to the artistic taste of Aldo Manuzio. See ALDINE EDITIONS.

The 16th c. is confessedly the Augustan age of Italian letters, art, and science. In a galaxy of splendid names, the brightest are those of Ariosto (q.v.), Tasso (q.v.), Macchiavelli (q.v.), Guicciardini (q.v.), Raphael (q.v.), Michael Angelo (q.v.), Palladio, and Vignola. Pope Leo X. and his successors vied with the other sovereigns of Italy in their munificent patronage of those men of genius, who, under the title of Cinquecentisti, are considered models of pure and noble Italian composition. The *Orlando Furioso* of Ariosto, held to be the first genuine epic of chivalry and romance, celebrates the deeds of the legendary ancestors of the house of Este. It exercised immense influence, even amongst the most illiterate classes, by whom its choicest beauties were committed to memory, in order to be sung as the solace of labor in the field or city. The next great work of the century was *La Gerusalemme Liberata*, by Torquato Tasso (q.v.), whose father was also an excellent poet and scholar. Tasso's prose writings and epistles are noble in style, and grave and philosophical in matter (1544-95). Their best imitators are L'Alamanni, *Il Giron Cortese* and *L'Avarechide*; Rucellai; and Erasmo da Valvasone, in his *La Cuccia* and *L'Angeleida* (or The Wars of the Angels), from which Milton probably borrowed some valuable hints (1593). Giangiorgio Trissino wrote the first notable Italian drama, *Sofonisba*. Besides this, the *Tullia* of Ludovico Martelli, the *Cunaceo* of Sperone Speroni (1590-88), the *Torrisondo* of Tasso, and the *Edipo* of Andrea dell' Arguillara, deserve mention—the last is considered the best Italian tragedy of the time. The comedies of Bentivoglio, Salviati, Cecchi, Firenzuola, and others, are stamped with that prevailing spirit of licentiousness which disfigures many of the finest productions of the age. The popular dramatic pieces, or *Commedie dell' Arte*, enjoyed as high repute among the lower classes as the higher drama did in courtly and patrician circles. Some of the chief composers of these pantomimic comedies are Flaminio Scala, Angelo Beolco, Andrea Colmo. The writers of pastoral dramas inundate this epoch, but none can compete with Guarini (q.v.) in his sweet idyllic work, *Il Pastor Fido*. Poetry was first combined, during this century, with music—one of the earliest operatic compositions being the *Dafne* of Rinuccini (died 1621). The sonnets of Michael Angelo excel in a certain dignity and originality of thought. Vittoria Colonna, celebrated in the verse of Ariosto, was the most illustrious poetess of her time; which produced numerous other female writers, whose works have been collected and published by Domenichi.

Foremost among the prose-writers stands Macchiavelli; his *Arte della Guerra* (Art of War), *Istorie Fiorentine* (History of Florence), and political treatise, *Il Principe* (The Prince), all excel in their various styles. Giovanni Botero, Giannotti, and Paruta, are also political writers of high merit. Greater than either is Francesco Guicciardini, whose *History of Italy* has only one blemish, viz., want of brevity. The works of Bembo (q.v.), historian and poet, exhibit the Italian language subjected to a regular grammatical system. Literature was historically treated by Barbieri and Doni; art, by Vasari, Campi, and Lomazzi; and architecture, by Vignola and Palladio.

The progress of the age is equally perceptible in philosophy, which, bursting the fetters of scholastic formalism, displays the utmost freedom of speculation in the works of Cardan (q.v.), Bruno (q.v.), and Vanini. Many celebrated institutions or academies for the discussion and diffusion of knowledge date from the 16th c., one of the most noted being the academy Della Crusca, founded at Florence for the preservation and perfecting of the Italian language.

The 17th c., if less prolific in great literary names than its predecessor, is nevertheless the golden age of Italian science; it produced a host of illustrious discoverers in philosophy, mathematics, and physic. Such was the fame of Italian science at this period, that the universities of Florence, Naples, Pisa, and Venice were thronged with foreign students. Learned societies for the cultivation and practical demonstration of the physical sciences were opened throughout Italy (see ACADEMY). Libraries were collected and enriched, to afford every facility to learned research. The most celebrated savants are the world-famous Galileo (q.v.), Torricelli (q.v.), Borelli, the astronomer Cassini (q.v.), and Viviani, the pupil and biographer of Galileo; Malpighi and Bellini, anatomists and physicians. Contemporary with these, we find Gian Vincenzo Gravina, whose lectures on civil law attracted audiences from all Europe. In historical composition, the best known works are Sarpi's famous *History of the Council of Trent*; its equally famous refutation by Pallavicino; *The History of the Wars of the Netherlands*, by Bentivoglio; and of *The Civil Wars of France*, by Davila (q.v.). A few of the great names of literature are Bianchi, an acute thinker on political and social science; Monte-Cucculi, author of the *Aphorisms of the Art of War*, written with Spartan brevity of style; Bartoli, the Jesuit historian; and Segneri, the Jesuit orator.

The poets of the 17th c., at least Marini (q.v.) and his school, display a degenerate taste. Fondness for trivial conceits, false glitter, and artificiality, are their characteristics; but several of his contemporaries—Chiabrera, Guidi, Tassoni, author of the admirable mock-heroic poem, *La Secchia Rapita* (The Stolen Pail), Filicaja (q.v.), and others, have written with a grave energy of a style and a warmth of sentiment elevating to any

age. The theatrical and operatic representations at the various sovereign courts were of exceeding splendor, as if in compensation for the paucity of dramatic compositions.

In the 18th c. a vigorous revival of poetry and letters took place. Giannone, in history; Capasso, in literature; Cirillo, in physic; Mazzochi, in archaeology; Il Genovesi, in political economy; the brothers Galiani, in their respective sciences of architecture, political economy, and philology; Filangieri (q.v.) and Beccaria (q.v.) in the philosophy of jurisprudence; Mario Pagano, in the science of civil law; Poli (1746-1825), Volta (1745-1826), Galvani (1737-98), Scarpa (1748-1832), and Spallanzani (1729-99), in physical science; Maffei and Calsabigi, in poetry, are some of the names by which this period was ennobled. The 18th c. can also boast of the greatest names in Italian dramatic literature, Metastasio (q.v.) (1698-1782), who is considered the master of the pastoral drama: flowing, sweet, and silvery, the language of his gentle muse presents a strange contrast to the brevity, sternness, and classical plainness of Italy's greatest tragedian, Vittorio Alfieri (q.v.) (1749-1803), by whom a thorough revolution was effected in the drama of his country. A no less marked reformer of comedy is his contemporary, Carlo Goldoni (q.v.) (1707-93).

During the present (19th) century, the genius of Italy has revived anew in science and literature. By the best writers of the day, a sound Italian style, untainted either by Gallicisms or by the false glitter of the *Seicentisti* school, has been adopted. One of the best modern poets of the classical school, Vincenzo Monti, has materially assisted this literary reform: the resolute combatant of the school of Marini, his fine works are rigidly molded on the pure *Trecentisti* style; and in his great poem, *Bassavilliana*, the language is impregnated with a Dantesque grandeur, which has caused it to be said that the spirit of Dante has inspired the works of Monti. His translation of the *Iliad* and that of the *Odyssey* by Pindemonte are the best classical translations in Italian. In the wayward and fervid genius of Ugo Foscolo (q.v.), we find the reflection of the vicissitudes and political chaos of his times; his lyrical work, *I Sepolcri*, is written with extreme polish and faultless taste, which may also be said of the lyrics of Leopardi. Botta, Ricci, Bagnoli, Arici Sestini, Pananti, and Lorenzi deserve mention among the modern poets. Grossi is a spirited poet, who has written chiefly in the Milanese dialect. In the poignant and imbibited verses of Berchet, we recognize the double inspiration of his country's and his own political sufferings: and the gentler poet, Silvio Pellico, was already famous for his poetic tragedy, *Francesca da Rimini*, previous to his incarceration in an Austrian dungeon.

Rossetti, the exile and poet, and the most distinguished commentator on Dante's *Divina Commedia*; Giov. Battista Niccolini, whose drama, *Arnoldo da Brescia*, is one of the finest works of modern Italian genius; Leopardi, poet, philologist, and philosopher; Giusti (q.v.), the first Italian satirical lyrist of the 19th c.; Mameli, the patriot poet, who fell in 1848 at Rome; Prati, Aleardi, Dall' Ongaro, Careano, and Montanelli are some of the most conspicuous worshipers of the Italian muse in the 19th century. Among the most successful novelists are Manzoni, whose *Promessi Sposi* has created a new school of fiction; Rosini (*Monaco di Monza*, *Luisa Strozzi*, *Il Conte Ugolino*), Cantù (*Margherita di Pusterla*), Grossi (*Marco Visconti*), and D'Azeglio, whose patriotic novels have exercised a wide influence on the youth of the country. *Ettore Fieramosca* and *Nicolo dei Lapi* are models of classical romances. Guerrazzi has written novels full of the noblest poetry. Bersezio and Ruffini are also worthy of notice. And among authresses we may mention Teresa Baudinella, Cecilia de Luna Folliero, Guistina Michiel, Isabella Albrizzi (whose biography of Canova is a graceful and accurate delineation), and Signora Ferrucci, whose educational works possess high merit. The modern historians of Italy are very numerous. Balbo's *Summary of Italian History*, Botta's *History of Italy*, Coletta's *Naples*, Amari's *Sicilian Vespers*, Cantù's colossal work on *Universal History*, Zeni's *Compendium of Italy's History*, and Scopoli's *History of Italian Legislation*, are among the best works; while interesting historical monographs of various periods or states have been published by Canetti, Canale, Brofferio, Anelli, Cattaneo, the graphic recorder of the rising at Milan in 1848, and the learned compiler of the *Archivio Triennale*, or series of documents bearing on Italian modern history from 1848 to 1850. Political economy and philosophy have found in Mazzini, Gioja, and Romagnosi able exponents. The political writings of Joseph Mazzini (q.v.), apart from their political tendencies, have exercised immense influence on the youth of Italy by their high moral tone and beauty of language. The various schools of philosophy have found adherents and expounders in Borelli, Galuppi (1770-1846), Mamiani, Rosmini, Gioberti, and Tommaseo, mostly all exponents of ecclesiastical philosophy; while Testa, Franchi, Mastriani and Cattaneo are the exponents of speculative and independent philosophy. Antiquarian and archaeological science has been ably illustrated by Inghirami, Fannucci, Manno, Litta, Visconti, and Sestini. Bossi, Fumigalli, Ferrario, and Rosini have written the best dissertations on art. Biography, which as yet has been somewhat neglected by Italian writers, has found in prof. Villari a successful cultivator; his *Life of Savonarola* is written with liberality, grace, and eloquence. The most complete histories of Italian literature are Crescimbeni, *Storia della Volgar Poesia*, 6 vols. (Rome, 1698; Venice, 1731); Quadrio, *Storia e Regione d'ogni Poesia*, 7 vols. (Bologna, 1739); Tiraboschi, *Storia della Letteratura Italiana*, 14 vols. (Modena, 1772-83; 16 vols. 1787-94; 12 vols. Rome, 1785; 16 vols. Milan, 1822-26); Corniani, *Secoli della Letteratura Italiana*, 9 vols.

(Brescia, 1818-19); Maffei, *Storia della Letteratura Italiana* (2d ed., 1834); Giudici (1847); De Sanctis (1871); and *Storia letteraria d'Italia scritta da una società di amici* (Milan, 1870-77).

ITALY, FREE CHURCH IN, established by the Italian patriot and reformer Gavazzi. It originated with the dawn of civil liberty in 1848, when men began to read the Bible, though for the act they were sent to prison and exile. But in 1853 a free church was begun in Turin. After Pius IX. had changed his liberal policy, Gavazzi was arrested by his orders, but, being rescued by the citizens of Viterbo, he visited England, Scotland, and subsequently the United States, where in addresses to crowded assemblies, he related the wrongs of the Italian nation. The movement for a free church made but little progress for want of union. In 1870 Gavazzi returned to Italy; a general assembly was held, in which 23 churches were represented; a confession of faith was prepared; and the name *Free Church in Italy* was adopted. This confession is a declaration of the principles held by all evangelical Christians, and the Free church is in harmony with the Waldensian and other Protestant churches. The constitution is partly Presbyterian and partly Congregational or Independent, the general assembly being composed of deputies from the churches, and each church independent of all the others in local affairs. The general assembly appoints the committee that superintends the entire work, and the funds collected by the commissioners are remitted directly to that committee. The Free Church in Italy now has 71 places of worship, 1800 communicants, 800 Sunday-school children, 1700 day scholars, with 21 teachers, 15 ordained ministers, 15 evangelists, 49 elders, 67 deacons, and 11 deaconesses. There is scarcely one important town in Italy in which there is not a Free church congregation. A new church has recently been built in Turin. Native evangelists visit every place. There are several theological colleges. In Rome is a theological seminary near the Vatican, in which Gavazzi is professor of sacred rhetoric. The Free church of Scotland has given it a professor of didactic theology, and Christians in Great Britain have bought and presented to it the old church of San Jacopio in Florence. Recently a valuable church on the piazza San Marco in Venice was purchased. The Free church has received from the city of Florence an annual bounty for one of their schools, and the minister of public instruction in Rome sent a complimentary letter with 300 francs. The Free church, since its regular organization, has grown steadily, and its influence is felt in every province of Italy.

ITAMARATI', a beautiful cascade in Brazil, about 50 m. n.w. of Rio Janeiro. It is nearly perpendicular, and the height about 250 feet.

ITARD, JEAN MARIE GASPARD, 1775-1838; b. France. Without a medical education, he was appointed assistant surgeon in the military hospital at Toulon, at the hospital of Val de Grâce, and a physician to the deaf and dumb institution. He was noted for his training of the wild boy of the forests of Aveyron, of which he gave an account in two works, 1807, and for the success of his treatment of deaf mutes. His *Diseases of the Ear*, 2 vols., 1821, is a standard medical work.

ITASCA, LAKE. See MISSISSIPPI.

ITASCA, LAKE, a lake in Minnesota, lat. 47° 10' n., about 8 m. in circumference, one of the sources of the Mississippi, and 1575 ft. above the sea. It is a beautiful body of water in the midst of pine-covered hills.

ITASCA, a co. of Minnesota, bounded by Rainy lake and Rainy Lake river, s.w. by the Mississippi; 5,200 sq.m.; pop. '70, exclusive of Indians, 96. It is drained partly by Big Fork river, and partly by some tributaries of Rainy Lake river. There are many lakes, marshes, and pine forests. There is here a reservation of Indians.

ITCH (known also as SCABIES and PSORA) is a contagious vesicular disease of the skin. All parts of the body, unless perhaps the head, are liable to be affected, but the most common seats of the disease are the wrists and hands, and especially between the fingers. The first sign of this affection is an itching sensation, which, upon minute examination, is found to proceed from a minute conical vesicle, while the adjacent portions of epidermis present a more scaly appearance than is natural. This condition of the skin is due to the presence of a minute acarus, the itch-mite (q.v.), which burrows within the epidermis, and excites the cutaneous irritation. The affected parts itch with increased intensity when the patient is warm in bed, or after the use of stimulating drinks or exciting condiments; and as he cannot refrain from scratching himself, the vesicles get more or less broken, and become interspersed with numerous little bloody points.

The itch being popularly regarded as a somewhat disreputable affection, and being highly contagious, it is very important that it should be distinguished from other cutaneous disorders. Eczema, prurigo, and lichen, are the affections most likely to be confounded with it; but eczema, though a vesicular disease, presents rounded and not conical vesicles, and at most only a pricking sensation, and nothing like the irritation of itch; while prurigo and lichen are papular disorders, and are not accompanied by the presence of vesicles; moreover, none of these diseases are contagious.

The itch is always communicated by contact, either immediately, as by the act of shaking hands, or through the medium of articles of clothing or bedding which have been used by a person suffering from the disorder. In some cases, the proximate cause

of the disease, the itch-insect, is conveyed to the sound person in its perfect form, while in other cases, the ova or embryos suspended in the fluid of the vesicles may be the mode of transmission.

The disease, if not cured, will go on for an indefinite period, probably for life; but in cold and temperate climates never gives rise to serious injury to the health. Numerous external remedies have at different times been employed for the cure of this disease, but the great remedy is sulphur, which may be regarded as a specific. In the case of an adult, Mr. Erasmus Wilson, our highest English authority on skin-diseases, recommends that "four ounces of sulphur ointment should be well rubbed into the entire skin before the fire, and particularly into the affected portions, morning and evening, for two days. It is desirable also that the patient should wear a flannel shirt, and retain the same during the whole of the treatment. On the morning of the third day, the patient should take a warm bath, and wash the skin thoroughly, with plenty of soap, when the cure will generally be found to be effected."

When patients strongly object to the smell of sulphur, which is not unfrequently the case, an ointment made by digesting over a vapor-bath, for 24 hours, three parts of stavesacre in powder, with five parts of lard, and then straining, may be used. According to M. Bourguignon (who has made numerous experiments on the deleterious action of medicines on the living itch-mite), this ointment will cure the disease in four days.

ITCH-MITE, *Acarus scabiei*, or *sarcopetes scabiei*, is supposed by some naturalists to have been referred to by Aristotle in the 5th book of his *Historia Animalium*, cap. 31. But although the itch was undoubtedly known both to the Greeks and Romans, there is no certain evidence that a mite was recognized as the cause of the disease earlier than by Avenzoar, an Arabian physician of the 12th century. Throughout the whole of the middle ages, and till the present century, the necessary connection between the disease and the mite was universally recognized, as is obvious from the writings of Scaliger (1557) and others; and a paper read by Adams before the royal society in 1805, contains two very good figures of the mite. During the first ten years of this century, many practitioners, not succeeding in finding the animal, expressed doubts concerning its existence, and in 1812 there occurred a remarkable incident in the history of this mite. M. Gales, the chief apothecary to the hospital of St. Louis, tempted by a prize offered by one of the unbelievers, published in that year a treatise on the itch, in which he declared that he had seen more than 300 of the mites, and in which he gave a drawing of the animal, which, although it differed materially from the delineations of earlier observers, was at once accepted as an exact representation of the true parasite, and was copied for several years into all works treating the itch, until Raspail discovered that M. Gales's memoir was a tissue of deceptions, and that the animal which he had figured was the *cheese-mite*! The existence of the itch-mite was now more distrusted than ever, until, in 1834, Renucci, a Corsican student, demonstrated the presence of the creature. Many points regarding the structure and habits of this curious animal have been since revealed by the investigations of Gras, Raspail, Hebra, Gudden, and especially De la Foad and Bourguignon, who have presented to the French institute *A Practical Treatise on the Entomology and Comparative Pathology of the Itch as it occurs in Man and the Domestic Animals*, which has been published in the last volume (1862) of the *Memoires présentés par divers Savants à l'Académie des Sciences*.

The adult female mite is considerably larger than the male; it is visible to the naked eye, and forms a roundish grayish-white corpuscle, not unlike a starch granule; it is about one-fifth of a line in length, and one-seventh in breadth. When seen under the microscope, it presents a truncated tortoise-like shape, and is seen to be studded with hairs and bristles. The head terminates in two pairs of mandibles, and these mandibles afford good characteristic distinctions of the species.

In order to penetrate the horny layer of the epidermis, the mite assumes, according to Gudden, a nearly perpendicular position; and to avoid as much trouble as possible, it usually selects such spots as give least resistance, such as the space between the fingers, the inside of the wrist, etc. Once fairly buried, it does not again come out, but burrows, and forms tortuous galleries within the skin. These galleries resemble the mark which is formed when a pen is drawn lightly over the skin without causing a scratch. In young children, and in persons with a delicate skin, they appear of a grayish-white color; while in persons with a coarse dirty skin they are of a blackish tint. At certain intervals, the galleries are pierced by small openings, for the admission of air; it is through these openings, which sometimes appear like very minute black dots, that the young escape. The vesicles characteristic of the itch-disease are attributed to a poison ejected by the mite. The males are smaller and much scarcer than the females.

There are numerous species of itch-mite (*scroopetes*) which infest the lower animals. One of them (*S. canis*) produces *mange* (q.v.) in dogs; another (*S. equi*), a comparatively large species, sometimes occurs in horses; another (*S. bovis*) in oxen in some parts of Europe; another (*S. ovis*) in sheep. Some of these are occasionally transferred to human beings, and cause irritation and annoyance, which, however, seems to be limited to the life of the individual mites transferred, the situation not being congenial enough for their increase.

For further information on the structure and habits of this animal, the reader is referred to the second volume of Küchenmeister's work on parasites (translated for the Sydenham society), and to Bourguignon's treatise.

ITH'ACA (now THIAKI), one of the Ionian islands (q.v.), and the smallest of them except Paro. It lies 17 m. w. of the mainland of Greece, and 2 m. n. of Cephalonia. The surface is mountainous, but there are many pleasant valleys. Length, 15 m.; breadth, 4; area, about 40 sq. miles. It was celebrated among the ancients as the principality and home of Ulysses; and some Cyclopean ruins near Porto Molo are called by the islanders the ruins of the castle of Ulysses. In 1871 the population of the island was about 13,000, of whom about 2,500 were in the town of Vathi, its seaport and capital.

ITH'ACA, a village in the state of New York, United States, at the southern extremity of Cayuga lake, 162 m. w. by s. from Albany. It has a large trade in coal, and 30 mills and manufactories. Pop. '70, 8,462.

ITHACA (*ante*), the capital of Tompkins co., N. Y., 142 m. s.w. of Albany, 37 m. s. of Auburn, and 40 m. s.e. of Geneva; pop. '70, 10,058; a beautiful town, built partly on a plain, partly on slopes of high hills, amid picturesque scenery. Three streams here enter the lake, falling from the hills in a series of cascades of remarkable beauty. It is the seat of Cornell university, has several public and private schools, a preparatory school, a large free library, 14 churches, 2 national banks, good hotels, 7 newspapers, and several manufactories for paper, flour, agricultural implements, calendar clocks, carriages, steam-engines, and machinery. It is the terminus of the Cayuga Southern railroad, and on the Utica, Ithaca and Elmira railroad. A branch of the Delaware, Lackawanna and Western railroad extends from this place to Owego. Daily steamboats on the lake connect Ithaca with the New York Central railroad at Cayuga.

ITHU'RIEL. According to *Paradise Lost*, one of the two guardian angels directed by Gabriel to discover and bring before him Satan, who had surreptitiously obtained access to the garden of Eden for the purpose of beguiling Adam and Eve.

Ithuriel and Zephon, with winged speed
Search through this garden; leave unsearched no nook;
But chiefly where those two fair creatures lodge,
Now laid, perhaps, asleep, secure of harm.

—*Paradise Lost*, Book IV.

ITINERANCY, a term applied to limited pastorates in the Methodist church. The system originated with Wesley. To accomplish what he considered necessary for the revival of religion in England, he traveled from town to town, and, remaining but a day or two in a place, he adopted the plan of commissioning a few competent men to preach in the societies which he had organized. These helpers, as he called them, rapidly increased, but the societies increasing still more rapidly, he found it necessary to extend and methodize their labors on some plan of itinerancy, and accordingly appointed them to definitive "circuits" for a year. At first the whole country was divided into 7 of these itinerant districts, and at Wesley's death there were 72 in England, 3 in Wales, 7 in Scotland, and 28 in Ireland. The "circuits" were long, and the preachers were changed from one circuit to another every year or two. The "circuit" system is still retained in England, and exists in America among the feebler churches, and generally among the frontier settlements of the west. The societies in cities and the large societies in the country are generally "stations," each being supplied by its own pastor. Connected with the itinerancy of Wesley were the local ministry, or gifted laymen in secular business, who preached in the absence of the regular or itinerant preachers, and the weekly class-meeting of 12 members under an experienced leader. Wesley adopted this system from expediency, as it enabled one preacher to serve in many places, and made small abilities available on a large scale; and he found by experience that a frequent change of teachers was best. The itinerant system has always been cherished with great care by the Methodists, though the length of time for which a minister may remain on the same "charge" has varied at different times from one to three years. Many in the Methodist church are dissatisfied with the system of frequent removals, and its comparative advantages and disadvantages have been fully discussed in their leading periodicals.

ITINERARY (Lat. *itinerarium*, derived from *iter*, a journey), the name given by the Romans to a table of the stages between two places of importance, with the distances from one to another. The itineraries of the ancients contribute much to our acquaintance with ancient geography. Of these the most important are the *Itineraria Antonini* and the *Itinerarium Hierosolymitanum*. The *Itineraria Antonini* are two in number, the *Itinerarium provinciarum* and the *Itinerarium marinum*, the former containing the routes through the Roman provinces in Europe, Asia, and Africa; and the latter the principal routes of navigators, who then sailed only along the coasts. They take their name from Antoninus Caracalla, by whom they were published, as corrected up to his time, but they seem to have been originally prepared at an earlier date.—The *Itinerarium Hierosolymitanum* was drawn up 333 A.D., for the use of pilgrims from Burdigala (Bordeaux) to Jerusalem. Of these itineraries various editions have been published.

ITINERATING LIBRARIES are small collections of books for popular reading contained in boxes, one of which, after being stationed in a village for a certain length of time, is transferred to another village, when another takes its place; and so on with any assigned number of boxes, each with its special assortment. The principle of shifting about boxes of books in this way in rural districts is referred to in the memoirs of Oberlin (q.v.), and has been long known in Wales, as well as the Highlands; but it met with no significant approval until it was improved upon and carried practically into effect on a broad scale by Samuel Brown, a merchant in Haddington (died 1839), who, taking a deep interest in popular instruction, set on foot itinerating libraries in several villages of East Lothian, 1817. The books were assorted to the extent of 50 volumes in a box. At first there were four boxes; and as the time allowed for each was two years at a village, the inhabitants of four villages had the perusal of 200 volumes in the space of eight years, at one-fourth the expense of the whole. The undertaking was begun and locally superintended from motives of benevolence, and the books were supplied gratuitously. The success attending this economic method of establishing libraries in a country district led to its extension over a wider sphere, on the principle of readers paying a small sum per annum, also of forming the assortments of books from the used new works in a central subscription library. There are several itinerating divisions in use in East Lothian and other parts of Scotland, as also in England, and 12 divisions were some time ago transmitted to Jamaica, where they were to be under the charge of missionaries. From all that can be gathered, the establishment of libraries of this simple class proves a valuable auxiliary to schools, churches, and other agencies of social improvement. For a variety of particulars on the subject, see a small volume, *Some Account of Itinerating Libraries and their Founder* (Edin. 1856).

IT'US PORTUS, the place where Cæsar, 55 and 56 B.C., set out for the conquest of Britain. Its site has been much disputed, but the best geographers, as D'Anville and Long, now agree that the actual spot was the village of Wissant or Duessant, on the coast of France.

IT'RI, a t. of s. Italy, in the province of Caserta, 6 m. n.w. of Gaeta, picturesquely situated on a lofty isolated hill, surmounted by a ruined castle. Itri was the birthplace of the celebrated bandit, Fra Diavolo. Pop. above 6,000.

ITU', a t. of Brazil, in the province of San Paulo, and 40 m. n.n.w. of the town of San Paulo, on the Tiete, in one of the most fertile districts of the province, and surrounded by lofty hills. Most of the houses are built of earth or mud in a framework of wood. Sugar-cane is extensively cultivated in the surrounding district. Pop. 10,000.

ITURÆA, a district of ancient Syria, which, with Trachonitis, formed in the time of Christ the tetrarchy of Philip, bequeathed to him by his father, Herod. The name is supposed to have originated from Itur or Jetur, one of Ishmael's sons, and the country to have formed part of the kingdom of Bashan. Pliny places it n. of Bashan, near Damascus, and J. de Vitry as adjoining Trachonitis. Iturea was first annexed to Syria by Claudius. It is probably the same as Jedur, which contains 38 towns and villages, some of which are desolate, and the rest occupied by poor peasants.

ITURBIDE, DON AUGUSTIN DE, Emperor of Mexico, was the son of a Biscayan nobleman and a rich Creole, and was b. at Valladolid, in Mexico, in 1784, or, according to others in 1790. On occasion of the first insurrections in Mexico, he was appointed by the viceroy, Apodaca, to the command of the militia of his province, and was successful against the insurgents; but he afterward inclined more to their cause, and being intrusted by the viceroy with the command of the army in 1821, he went over to them, when he found it impossible to obtain a separate constitution for Mexico. In May, 1822, he ascended the throne of Mexico as emperor, under the name of Augustin I., and the congress declared the crown hereditary in his family. He seemed to aim at ruling well, but rather as a despotic than a constitutional sovereign. His reign was full of trouble, and came to an end in less than a year by his abdication on Mar. 20, 1823. He received a pension of 25,000 piastres from the congress on condition of his residing in Italy, and went with his family to Leghorn. Having resided a few months in that city he repaired to England, where he organized an expedition for the recovery of the empire which he had surrendered; and issued a declaration that he would employ whatever influence he might obtain on his return to Mexico for the introduction of the political institutions of England into that country. He embarked May 11, 1824; landed in disguise at the port of Soto-la-Marina, July 14; was arrested on the 17th, and shot at Padilla on the 19th of the same month. The Mexican congress made a provision for his family. His son was adopted by the late emperor Maximilian of Mexico as his heir, Maximilian himself being childless. The overthrow of the Mexican empire, however, has cut off his prospect of a throne. See *A Statement of some of the Principal Events in the Public Life of Augustin de Iturbide, written by himself*; translated by M. J. Quin (1824).

ITURUP, the largest of the Kurile Islands, belonging to Japan, n. lat. $44^{\circ} 29'$, e. long. $146^{\circ} 34'$. It is 140 m. long, with an average width of 20 miles. It is of volcanic origin, fertile, and well-watered. The people are employed chiefly in hunting and fishing.

ITZA, LAKE OF. See PETER.

ITZAS', or ITZAES, an interesting tribe of Central American Indians, inhabiting the shores of lake Itza, in Guatemala. Their history points to an extensive early civilization. According to their traditions, one of the caneks or princes of Yucatan migrated south, 1420, and built a city on the island of Tayasal in lake Itza, which with the island soon contained a population of 25,000. They were visited by Cortez, 1525, who gives an account of their high advancement and friendliness of character. From their isolated position they were able to maintain their independence until 1698, when they were overcome by Manuel de Ursula, the Spanish governor of Yucatan, their cities laid waste and their temples destroyed. A small remainder of them are found on the islands of lake Itza, who are nominally Roman Catholic.

ITZEHOE, a t. of Denmark, in the duchy of Holstein, and the oldest in the duchy, is situated on the Stör, in a valley backed by finely-wooded hills, about 50 m. by water n.w. of Hamburg. Tobacco, chicory, sugar, and brandy are manufactured, and important horse and cattle markets are held here. Itzehoe also carries on a considerable general trade by water with Altona and Hamburg. Pop. 6,691.

The original castle around which Itzehoe gradually arose was built by Charlemagne in 809. Itzehoe was twice taken by Tilly in the thirty years' war, and in 1657 a great portion of it was burned down by the Swedes.

I'VAN, or I'WAN (the Russian form of John), the name of a number of Russian czars.—IVAN I. (1462–1505) may be regarded as the founder of the Russian empire. He was at first only grand duke of Moscow, but succeeded in shaking off entirely the yoke of the Tartars, and in subjecting a number of the Russian principalities to his own sway. In 1472 he married Zoë, a niece of the last Byzantine emperor, and thus brought the two-headed Byzantine eagle into the Russian arms, an emblem with which are connected pretensions not likely to be forgotten by the Russian emperors, although they may not be openly urged. This marriage opened up a way also for the entrance of European civilization into Russia.—IVAN II. (1533–84) did much for the advancement of his country in arts and commerce, as well as for its extension by arms. He concluded a commercial treaty with queen Elizabeth, after the English had discovered the way to Archangel by sea. He bore, however, the surname of the cruel, and merited it by his deeds, among which was the slaughter of 60,000 persons—other accounts make the number only 25,000—at Novgorod in six weeks, on account of a supposed plot to deliver up the city and surrounding territory to the king of Poland.—IVAN III., born Aug. 23, 1452, was the son of the duke Anthony Ulric of Brunswick-Wolfenbüttel, and the Russian grand duchess, Anna Carlowna. The empress Anna Ivanowna adopted him as her son and heir, but she dying soon after, and Elizabeth, the daughter of Peter I., seizing the throne, he was imprisoned during the remainder of his life; and by the orders either of the empress Catherine II., or of her counselors, was put to death by the officers of the garrison at Schlüsselburg, where he was confined, on Dec. 5, 1764. Those Russian Ivans are sometimes differently numbered, the reckoning being made to begin further back, with those who were only grand dukes of Moscow.

IVANOVO, a t. of Russia, in the government of Vladimir, 150 m. w.n.w. of Moscow, on the river Ouvod. The name of Ivanovo is found in the annals of the 16th century. In 1741 it came into possession of the counts Sheremetieff, to whom, at the present day, belongs the territory of Ivanovo, the pop. of which amounts to 24,000. The pop. of the town proper is about 5,500. Ivanovo is the center of the Russian cotton manufacture, which gives employment to a great part of the inhabitants, not only of the town, but also of the surrounding district. There are also large cotton-printing establishments in the town. The cotton-manufacture of Ivanovo has increased to a very considerable extent since 1812, in which year, on account of the French invasion, the greater part of the workmen left Moscow, and settled here. The connection of Ivanovo, by means of a branch, with the Moscow and Nijni-Novgorod railway, has given a fresh impulse to the industry and commerce of the place.

IVES, ELI, 1779–1861; b. Conn.; graduated at Yale college in 1799, studied medicine with Dr. Levi Ives, his father, and was associated with prof. Benjamin Silliman in founding the medical school of Yale, where he was prof. of *materia medica* and of the theory and practice of medicine. He was once president of the national medical association.

IVES, LEVI SILLIMAN, D.D., LL.D., 1797–1867; b. Conn. He worked on his father's farm in his youth, served a year in the army of 1812, and studied at Hamilton college with the view of entering the ministry of the Presbyterian church. In 1822 he took orders in the Protestant Episcopal church. He had charge of churches in Philadelphia, Lancaster, Penn., and New York. In 1831 he was consecrated bishop of North Carolina. During the Tractarian controversy in the Episcopal church his Roman Catholic proclivities were so marked, that his diocese distrusted him and became alienated. In 1852 he visited Rome, and was admitted into the Roman church. On his return he was deposed from his bishopric. The rest of his life was spent in the work of education and in the prosecution of several philanthropic enterprises. He was prof. of rhetoric in the Roman Catholic theological seminary at Fordham, N. Y. He published *The Trials of*

a Mind in its Progress Towards Catholicism. He had notable gifts as a preacher and writer.

IVI'ZA (anc. *Ebusus*), one of the Balearic isles (q.v.), lies about 50 m. s.w. of Majorca. It is 23 m. long, and 12 m. broad; pop. 11,000. Iviza, the chief town, has a pop. of 5,970. Salt, the principal article of export, is extensively manufactured on the shore.

I VORY was the name formerly given to the main substance of the teeth of all animals, but it is now restricted to that modification of *dentine* or tooth-substance which in transverse sections shows lines of different colors running in circular arcs, and forming by their decussation minute lozenge-shaped spaces. By this character, which is presented by every portion of any transverse section of an elephant's tusk, true ivory may be distinguished from every other kind of tooth-substance, and from every counterfeit, whether derived from tooth or bone. Although no other teeth, except those of the elephant, present this characteristic, many other animals, such as the walrus, narwhal, hippopotamus, etc., possess teeth, horns, or tusks, which, from their large size and from their density, can be used for the same purposes in the arts as those for which true ivory is employed. The ivory of the tusks of the African elephant is held in the highest estimation by the manufacturer, on account of its greater density and whiteness. The tusks are of all sizes, from a few ounces in weight to more than 170 lbs. each. Holtzapffel states that he has seen fossil tusks from the banks of the rivers of northern Siberia which weighed 186 lbs. each. There are various chemical processes by which it may be dyed of various colors, as black, blue, green, yellow, red, and violet.

Ivory articles can be made flexible and semi-transparent by immersion in a solution of phosphoric acid of sp. gr. 1.130, till they become translucent. They are then to be taken out, washed with water, and dried with a soft cloth, when they are found to be as flexible as leather. They harden on exposure to dry air, but resume their pliancy when immersed in hot water.

Much important information on the subject of ivory generally will be found in Holtzapffel's *Mechanical Manipulation*.

The tusks of the elephant have from very early periods constituted an important article of trade, in consequence of their great beauty as a material for ornamental manufactures, and even works in fine art. Ivory is frequently mentioned in the Old Testament. With the Greeks it became a most important material, and by the hands of the sculptor Phidias a statue was produced of the Olympian Jupiter, of such marvelous beauty and imposing majesty that it was considered a misfortune to die without having seen it. By the Romans, who were supplied from Africa, it was also extensively used, and by them its use was diffused over the whole of Europe. The art of working in ivory doubtless had its origin in India, where it has always been a much valued material, and formerly supplied indirectly much of the ivory sent to Europe. The value of ivory is in proportion to the size and soundness of the teeth. Below the weight of 5 lbs. they are called *serivellos*, and are of the least value, rarely reaching 5 shillings per pound; but double that price has been given for teeth of unusually large size. The quantity imported into Great Britain from all parts rather exceeds 500 tons per annum, the value of which is about £400,000.

The so-called ivory obtained from the hippopotamus is in especial favor with dentists for making false teeth, on account of its pure white color and freedom from grain. The fossil ivory, which is found in considerable quantity in Siberia and the arctic regions, is uncommonly hard and brittle; it is also whiter, and wants its waxy softness. At present the demand for ivory is rapidly increasing, owing to the great taste and skill of some of the artists who work in this material, and as the supply increases but very slowly it is likely to become very dear. The beautiful art of ivory-carving has recently made very extraordinary progress in Europe, as has been shown by works in ivory sent to the various international exhibitions; some single specimens have had a value of £500.

IVORY, ARTIFICIAL. See *CELLULOID*.

IVORY, VEGETABLE. This curious material is furnished by one of the most beautiful of all the palm tribe. It grows on the Andean plains of Peru, and on the banks of the river Magdalena, and other parts of South America. The stem of this palm (the *phytelephas macrocarpa*) is short and procumbent, but it has, proceeding from its crown, a magnificent tuft of light-green pinnated leaves of extraordinary size and beauty; they are like immense ostrich-feathers rising from 30 to 40 ft. in height. The flowers are on a crowded spadix, and have neither calyx nor corolla. The fruit, which is as large as a man's head, consists of many 4-celled leathery drupes aggregated together, and contains numerous nuts of a somewhat triangular form, each nut being nearly as large as a hen's egg; they are called *corazzo nuts* in commerce. The kernels of these nuts when ripe are exceedingly hard and white; in fact they resemble ivory so completely, that few names have ever been better applied than that of vegetable ivory. They have of late come into extensive use by turners in the manufacture of buttons, umbrella-handles, and small trinkets, and so closely resemble true ivory as frequently to deceive competent judges. Two or three millions of these nuts are now imported annually, and are chiefly used by the London and Birmingham turners.

IVORY, JAMES, 1765-1842; b. Scotland; an eminent mathematician, educated at the university of St. Andrews, and professor of mathematics in 1804 in the royal military

college of Marlow. In 1819 he retired with a pension. He was a member of many of the learned societies of England and Germany. His essays read before the royal society of Edinburgh, and his papers in the *Transactions* of the royal societies of Edinburgh and London, evince a mind of remarkably acute analytical power. He was granted, in 1831, an annual pension of £300.

IVORY-BLACK. See BONE-BLACK.

IVORY COAST, that part of the coast of upper Guinea which lies e. of the Grain coast and w. of the Gold coast. It extends from cape Palmas to the Assinie river. It contains several small towns, which have a traffic in gold-dust, ivory, and palm oil. The coast is low and unhealthy, but in the interior are extensive and fertile table-lands.

IVREA, a t. of Piedmont, in the province of Turin, has (1871) a population of 7,577, and is situated on the left bank of the Dora Baltea, partly on level ground and partly on an eminence exposed to the sirocco winds. The cathedral is supposed to have been a temple of Apollo, and contains an ancient sepulchral monument of the age of Augustus. The carnival of Ivrea is famed for its picturesque allegorical pageants.

IVRY-LA-BATAILLE, a village of France, on the river Eure, 40 m. w. of Paris, pop. 1053. It was strongly fortified and held by the English, but was captured from them in 1449, and the fortifications were destroyed. It is better known as the scene of the great victory of Henry IV. of Navarre, Mar. 14, 1590, over the duke of Mayenne. The obelisk erected to commemorate the battle was removed in the French revolution, but restored by Napoleon in 1809.

IVRY-SUR-SEINE, a manufacturing t. of France, in the department of Seine, is situated on the left bank of the river of that name, 3 m. above Paris. Glass, earthenware, and chemical products are the chief manufactures. Pop. '76, 15,247.

IVY, *Hedera*, a genus of plants of the natural order *araliaceæ*, consisting of shrubs and trees, mostly natives of tropical countries. The flowers have 5 or 10 petals, and 5 or 10 converging or consolidated styles. The fruit is a berry with 5 or 10 cells.—The COMMON IVY (*H. helix*) is a well-known native of Britain, and of most parts of Europe, although it is more rare in the northern countries. Its long, creeping, branched stem, climbing on trees and walls to a great height, and closely adhering even to very hard substances by means of rootlets which it throws out in great abundance along its whole length, acquires in very aged plants almost the thickness of a small tree. Its 5-lobed, shining, stalked, evergreen leaves, clothing bare walls with green luxuriance, serve to throw off rain, whilst the rootlets of the stem suck out the moisture, so as to render damp walls dry, contrary to a common prejudice, that ivy tends to produce dampness in walls. It injures trees, however, both by abstracting their sap and by constriction. The flowering branches of ivy have ovate, entire leaves, very different from the others. Its small greenish flowers are produced in the beginning of winter, and the small black berries are ripened in the following year. The berries are eagerly eaten by many birds, although they have a pungent taste, and contain a peculiar bitter principle called *hederine*, and an acid called *hederic acid*; which are also found in a gummy exudation obtained by incisions from the stem, and occasionally used in medicine as a depilatory and a stimulant, and in varnish-making. An ointment made from the leaves is used in the highlands of Scotland to cure burns. In Egypt, the ivy was sacred to Osiris, in Greece to Bacchus (Dionysos), whose thyrsus was represented as surrounded with ivy; the Romans mingled it in the laurel crowns of their poets.

There are several varieties of ivy often planted for ornamental purposes, of which that generally known in Britain as *Irish ivy*, and on the continent as *English ivy*, is particularly esteemed for its large leaves and luxuriant growth. It is said to be a native of the Canary isles. Ivy grows readily from cuttings.—*H. umbellifera*, a native of Amboyna, is said to produce a finely aromatic wood; and *H. terebinthacea*, a Ceylonese species, yields a resinous substance which smells like turpentine.

IWA'KURA TOMO'MI. A Japanese statesman, b. in Kioto about 1825, of one of the illustrious families called kugé (court nobles). Made personal attendant upon the mikado at the age of 20, he openly opposed the parsimonious support given to the emperor by the Tokugawa usurpers at Yedo, whom he was further led to oppose from their assumption, in the official documents of the American treaty, of the preposterous title of "Tycoon" (exalted prince), their true title being shōgun (general). In 1858 Iwakura opposed the opening of the ports to foreign trade, a measure then being urged at Yedo by the American minister, Townsend Harris, but approved of the marriage of the princess Katsuno-Miya to the shōgun at Yedo. Having the overthrow of the Tycoon ever in view, Iwakura became the willing agent, in the palace, of Saigo, Kido, Okubo, and the other revolutionary leaders, and largely through him the Yedo usurpation was overthrown, the mikado restored to supreme power, the feudal system destroyed, and all Japan unified under the present government at Tokio. In 1872 Iwakura was made minister of foreign affairs, and junior prime minister of the right, and with Kido, Okubo, and Ito, sent on an embassy to the treaty powers of the world, coming to Washington first. He opposed the invasion of Corea, and was severely wounded by assassins in 1874. Since 1867 he has been the foremost man in the Japanese cabinet, and nearest to the mikado. He is a man of great eloquence, energy,

decision, and culture—"the Bismarck of Japan." Three of his sons were educated in the United States.

IXCAQUIXTLA, a t. in Puebla, Mexico; pop. 5,000; noted for a severe battle, Jan. 1, 1817, between the Spanish troops under La Madrid and the Mexican rebels under gen. Mier. It is occupied by the Chuchon Indians, the remnants of a race of southern Mexico who were conquered by the Aztecs and Mixtecas. Near the town are numerous mounds of earth or stone, now used by the Indians as altars for their offerings to Montezuma.

IXION, in Greek mythology, a king of the Lapithæ. When Deïneus, whose daughter Dia he had espoused, demanded the usual nuptial gifts, Ixion invited him to a feast on pretense of paying him, and caused him to fall into a pit of fire which he had secretly prepared. Shunned by all for his treachery, Jupiter in pity invited him to his table, but, discovering his attempt to seduce Juno, he condemned him to be fastened to a perpetually revolving fiery wheel. He was the supposed father of the centaurs.

IXMIQUIL'PAN, a t. and district in the state of Hidalgo, Mexico, on the river Montezuma, 80 m. n. of the city of Mexico; pop. 10,000. In 1861 it was for some months the head-quarters of gen. Zuloaga, who claimed to be president. The inhabitants are mostly Indians of the Otomi race. In the vicinity of the town there are several silver mines owned by English companies.

IXTAPALA'PA, a t. of Mexico, 10 m. s.e. of the capital; pop. 5,000. When Mexico was conquered it was a large and important city, noted for the beautiful gardens of the Aztec kings, and was the residence of a brother of Montezuma.

IXTLAHUA'CA, a district in Mexico, in the northern part of the state of the same name, 60 m. from the city of Mexico. It was anciently the abode of the large and important race of Mazahua Indians. It has silver mines, which for lack of capital are not now worked.

IXTLAN', a t. and district of Mexico, in the state of Oaxaca, 40 m. from the city of Oajaca, occupied mostly by the Zapoteco Indians. It has numerous silver mines. In the neighborhood of Ixtlan is the village of San Pablo Guelatao, the birthplace of president Benito Juarez.

IXTLILXO'CHITL, FERNANDO DE ALVA; b. Mexico about the middle of the 17th c., and lived to a great age. He was a descendant of the kings of Tezcoco, was interpreter of the native languages to several viceroys of Mexico, and a laborious collector of the ancient MSS. and traditions of his country. Both Mr. Prescott and lord Kingsborough made use of his writings in the compilations of their histories. Many valuable manuscripts of his are in the archives of Mexico.

IYE' YASU. See TOKUGAWA.

IZABAL, a seaport of Guatemala, 123 m. from the capital, on the s. shore of lake Dolce or Izabal. It is 40 m. from the sea by the river Izabal or Rio Dolce. The water being low at the mouth of the river large vessels go to Balize, and their cargo is sent by coasting vessels to Izabal.

IZALCO, a t. in the republic of San Salvador, Central America, 40 m. s.w. of the city of San Salvador; pop. 4,000, mostly Indians. It was anciently a place of importance, especially for the cultivation of the cacao, but the earthquake of 1859 greatly affected its prosperity. The soil is well watered and fertile.

This is also the name of a remarkable volcanic mountain 36 m. n.w. of the city of San Salvador. It is near a group of extinct volcanoes about 6,000 ft. in height; and the first eruption occurred in 1770 during an earthquake. The eruptions are almost incessant, though of unequal violence, and are visible far out at sea. Mariners call it the "light-house of San Salvador."

IZAMAL', a city of Yucatan, 50 m. s.e. of Merida. A church and convent were built here in the 16th c. by the bishop of Yucatan. The ruins of an ancient city are found, which Mr. Stephens describes in *Travels in Yucatan*.

IZARD, a n. co. of Arkansas, drained by the White river, and bounded by it on the n.w.; 550 sq m.; pop. '80, 10,856. It is partly mountainous, and the soil is fertile. The staple products are wheat, maize, oats, cotton, and tobacco. Some minerals are found. The capital is Melbourne.

IZARD, GEORGE, 1777-1828; b. S.C. After receiving a classical education he traveled extensively in Europe. In 1794 he was appointed lieut. of artillery; in 1798 he had charge of the fortifications of Charleston harbor; and in 1799 was aid to gen. Hamilton. When the second war with Great Britain began he was appointed col. of artillery, Mar. 12, 1812; in 1813 was brig.gen.; in 1814 maj.gen. He was governor of Arkansas territory from 1825 till his death.

IZARD, RALPH, 1742-1804; b. S. C.; educated at Cambridge, England. He was a southern planter of great wealth in land and slaves inherited from his grandfather, who was one of the founders of South Carolina. He distinguished himself in the revolutionary war. During a residence in London, in 1771, he endeavored to show the British ministry the impolicy of their conduct towards the colonies, but, failing in his good

intentions, he retired in 1774 to the continent. In 1780 he returned to the United States, and by his influence obtained the appointment of gen. Greene to the command of the southern army. He evinced his patriotism by pledging his fortune to procure ships of war from Europe. He was a delegate to the old congress, 1781-83, and United States senator, 1789-95. He died at South Bay. He was polished in manners, an eloquent speaker, but of a passionate temper. His correspondence was published by his daughter in 1844.

IZDUBAR', a name found in Chaldean inscriptions recording ancient Babylonian legends, by some investigators supposed to be that of a veritable Babylonian king, but by others, including Max Müller and Rawlinson, supposed to signify the Hercules of the Chaldean mythology. The fact of the name occurring in inscriptions, possessed by the British museum, in connection with 12 legends not unlike those which describe the 12 labors of Hercules, has led to this latter conception. Meanwhile, other evidence derived from a similar source would appear to signify that this character was a king in Babylonia, who is, by some writers, identified with the biblical Nimrod, and who was deified after his death on account of his marvelous accomplishments. Mr. George Smith, of the British Museum, held this view of the matter, and in his *Assyrian Discoveries*, published in London in 1875, made a translation of the legends and inscriptions in question.

IZTACCIHUATL, an extinct volcano in Mexico, 15,705 ft. above the sea, near Popocatepetl, and 30 m. from Puebla. It is often called Sierra Nevada from its being covered with snow. The name, composed of the Mexican words *iztac*, white, and *cihuatl*, woman, was given on account of its resemblance to a woman in a white dress.

IZU'CAR, or MATAMO'ROS IZUCAR, a city and district of Puebla, Mexico. The city is 90 m. s.e. of Mexico, at the base of Popocatepetl; pop. 12,000. It is the center of a rich sugar region. A railroad was commenced in 1875 to connect it with Puebla. It takes its name from the Mexican gen., Manuel Matamoros.

J

J, THE tenth letter in our alphabet, has in Eng. the power of *dzh*; in Fr. of *zh*; and in Ger. of *y*. Both the sound and the character have sprung out of the original vowel *i*. When such a word as *Iulius* is pronounced rapidly, it naturally slides into *Yulius*. The Romans, though they had but one character for both, recognized this distinction between the vowel and the semi-vowel; and in the case of such words as *cuius*, *maiis*, some writers doubled the *i*, and wrote one or both long, as *cuIIus*, or *cuIus*. There is little doubt that the original Roman sound of this semi-vowel was that of Eng. *y* (youth), still given to it in German. But as this sound has a tendency to convert the consonant preceding it into a sibilant (see letter C), so it has a tendency to become itself sibilant, and *Yul-* slides into Fr. *zhul-*, Eng. *dzhul-*. This transition had already taken place in the later ages of the Latin, at all events, in the popular pronunciation, as appears from such inscriptions as *congiunta*, for *conuncta*; *Zesu*, for *Jesu*.

It was the Dutch scholars of the 16th and 17th centuries that first introduced a regular distinction between the consonantal and vowel powers of *i*, and marked the former by the distinct character *j* (a long *i*, projecting below the line). The character has been adopted in the modern Teutonic and Romanic languages. The Italian represents the sibilant sound of *j* by *gi* or *ggi*, as *Giovanni*, from Lat. *Johannes*; *maggiore*, from Lat. *major*. In Span., it has a guttural power, and is interchangeable with *x*, as *Xeres*, or *Jeres*.

JABBOK, a stream which intersects the mountain range of Gilead, and after a course nearly from e. to w., falls into the Jordan midway between the sea of Galilee and the Dead sea, 30 m. below the lake of Tiberias. Its whole length is about 65 miles. It was the boundary between the territories of the Amorites and Ammonites, and afterwards between the tribe of Reuben and the half-tribe of Manasseh. Its modern name is Wady Zerka. In its passage westward it runs more than once underground, but as it enters the more hilly country e. of the Jordan, its volume is increased from several springs which render it perennial. On approaching the Jordan it flows through a ravine deep, narrow, and wild, the steep banks of which, in nearly its whole course, are covered with cane and oleander. The scenery along the Jabbok is said to be the most picturesque in Palestine.

JA'BIRU, *Myteria*, a genus of birds of the same family with storks and adjutants; the chief distinction from the storks being that the bill is a little curved upwards. The species are few, but are widely distributed in South America, Africa, and Australia.

JABLONSKI, PAUL ERNST, 1695-1757; b. Berlin; the most distinguished oriental scholar of his time. After completing the usual course at Frankfort-on-the-Oder, he applied himself to eastern languages, especially the Coptic, and at the age of 21 was sent by the Prussian government to pursue his studies in the libraries of Oxford, Paris, and Leyden. On his return he became pastor of the Protestant church at Liebenberg, and

professor of theology at Frankfort. He was a member of the academy of sciences of Berlin. His works numbered 50, the most valuable of which is the *Pantheon Aegyptiorum*, 3 vols., 1750-52.

JABORANDI, a name given in South America to several species of plants used as diaphoretics. The plant grows chiefly in Brazil, and is most known in the neighborhood of Pernambuco. The botanical name is *pilocarpus pennatifolius* (Lemaire). The leaves are imparipinnate, composed of 4 to 10 short-stalked leaflets about 4 in. long, ovate-oblong, upper surface dark-green, shining, under surface paler, smooth or slightly hairy, midrib prominent. When bruised they are aromatic; taste somewhat bitter. The important constituents are a volatile oil, and an alkaloid called *pilocarpin*, which combines with various acids to form salts. According to Kingzett (1876) the chemical formula for the alkaloid is $C_{23}H_{34}N_4O_4$. According to Hardy the oil consists of a hydrocarbon, *pilocarpene*, having the formula $C_{10}H_{16}$; sp. gr. 85°; boiling-point, 352.4° F.; another hydrocarbon boiling at 492° F., and a third having a still higher boiling point, being a transparent solid when isolated, at ordinary temperatures. An infusion of the leaves or a fluid-extract or tincture, may be given internally; or one of the salts may be administered with a hypodermic syringe. When an infusion of 90 grains of the dried leaves, or an extract or tincture of corresponding strength is swallowed, it produces, in the course of two or three minutes, a flushing of the face, and in the course of five or six minutes drops of sweat appear on the forehead, and soon afterwards on other parts of the body and limbs. When sweating is established the face becomes pale, and a profuse secretion of saliva and nasal and bronchial mucus is poured out upon the mucous surfaces, and often there is an abundant secretion of tears. The salivation is often so profuse as to interfere with speech. The average duration of sweating is about one hour and a half, and the temperature usually falls 1° F. The average loss of fluid by sweating is nearly two pints, but the loss is said sometimes to be four quarts if the salivary and mucous secretions are included. Sometimes, though rarely, sweating does not take place, but salivation is more frequently absent than sweating. Vomiting is a usual occurrence, but the nausea is not great. The quantity of urine secreted during the sweating is diminished, and is passed with pain. Urea appears in the perspiration and saliva. The sight frequently becomes dimmed—an effect attributed to the action of the drug on the muscles of accommodation belonging to the lens. See EYE. Jaborandi is an effective galactagogue, or promoter of the lacteal secretion. When given in moderate doses it increases the flow of milk, and on this account is one of the most valuable late additions to the *materia medica*. The hypodermic injection of one-sixth or one-fifth of a grain of *pilocarpin*, or the muriate, produces much the same effects as the internal administration of the infusion of the leaves, but the action is more prompt as well as more lasting. With the hypodermic injection sweating always takes place, and vomiting is less frequent.

The medical uses of jaborandi are numerous. It often promptly relieves the distressing symptoms of pleurisy by removing the fluid in the pleural sac. See PLEURISY. In hydrothorax the relief given is even more noticeable, and also in many cases of dropsy, those arising from certain forms of kidney disease being often cured. In dropsy caused by heart-disease the relief which it affords is more temporary; and it should be used with great caution by those disposed to cardiac affections, as it possesses peculiar power in restraining the contractions of the heart, and is used by experimental physiologists in investigating the functions of the nervous system. In those dropsical affections, however, which are connected with simple hypertrophy of the ventricles, the use of jaborandi is attended with marked benefit. Dr. Gaspar Griswold, of New York, has employed the muriate of pilocarpin as a hypodermic injection in several cases of intermittent fever with almost uniform success. See INTERMITTENT FEVER. According to Galezowski, pilocarpin is equal to eserin, the active principle of the Calabar bean (q.v.), in producing contraction of the pupil, and is employed in ophthalmic surgery in cases where atropine, which produces dilatation of the pupil, is contraindicated. It is reported to have been used in mumps with signal benefit, and in asthma it has been found to give great relief. The salts of the alkaloid may be given internally in doses of from one-fourth to three-fourths of a grain, and hypodermically from one-sixth to one-fifth of a grain, dissolved in water.

JABUTICABA. See EUGENIA.

JACANA, *Parra*, a genus of birds of the order *grallæ*, commonly ranked in the family *rallidae*, natives of the warm parts of Asia and the Asiatic islands, Africa, and South America. In general appearance, they much resemble gallinules and coots. The feet, though not webbed, are adapted, by the great length of the toes and claws, for walking on the surface of weed-covered lakes and swamps, the native haunts of these birds, where they never fail to attract the attention of the traveler. The COMMON JACANA (*P. jacana*) is a South American species, abundant in Guiana and Brazil. It is about 10 in. long; black, except the back and part of the wings, which are of a bright chestnut color. The INDIAN JACANA (*P. Indica*) and the CHINESE JACANA (*P. sinensis*) are also among the best known species. Both are found in India and other parts of the east.

JACARANDA WOOD, a very hard, heavy, brown wood, also called *rosewood*, from its faint agreeable smell of roses. It is brought from South America, and is produced by

several trees of the genus *jacaranda*, of the natural order *bignoniaceæ*. Several species of this genus are called *caroba* in Brazil, and are there accounted anti-syphilitic.—Several species of the nearly allied genus *tecoma* also have an extremely hard wood, as *T. pentaphylla*, a native of the Caribbean islands. The Brazilian Indians make their bows of the wood of *T. toxiphora* or *pao d'arco*.

JACARÉ, the *crocodilus sclerops* of Schneider, or more recently the *jacaré sclerops*, a South American reptile allied to the alligator and cayman, and whose place has not, perhaps, been definitely assigned. The alligators and caymans belong to the family *crocodilidae*, and it has been proposed (see **ALLIGATOR**) to constitute a sub-family, *alligatoride*, dividing it into genera, *jacaré*, *alligator*, and *cayman*, and that classification is here adopted. The animal is found principally in the tropics, never, according to Azara, below 32° s. lat. It is particularly numerous in Brazil, where it attains a larger size than the North American crocodile or alligator. The head is rather thinner than that of the latter animal, the sides converging towards the snout, forming an isosceles triangle. The surface of the cranial bones has a rough, scabrous appearance, as if diseased. The orbits are surrounded by prominent ridges of bone, connected together by a median ridge, the whole presenting the appearance of a pair of spectacles. Behind the orbit the skull is pierced by two very small holes. The cervical plates are very large, are arranged in four transverse bands, the first two containing four plates each, and each of the others two. The transverse bands of the back, varying according to age and, probably, with the individual, usually consist of two rows with two plates each, four rows with six plates each, five rows with eight plates each, two with six, and four with four plates each. The jacaré is greenish brown on the upper side and on the under side marbled with various shades of green and greenish yellow. It attains a size of from 14 to 18 ft., the head forming about one-ninth of the whole length. It is not as fierce as the Mississippi alligator, and is said never to have been known to attack men unless near where it has laid its eggs. Their preferred food is fish and waterfowl, of which there is generally an abundance in the waters which they inhabit. Their eggs are about the size of those of a goose, white, and much sought after by the natives as food, who also eat the flesh of the reptile, but it has a strong, musky smell, and but little juiciness. The female deposits her eggs in the sand in a single layer, covering them with straw or leaves, but the vultures find most of them, and many of the young are devoured by the adult males when the rivers become low and other prey is scarce. See **ALLIGATOR**, **CAYMAN**, and **CROCODILE**, *ante*.

JACK. “The Jewish *Jacobus* was corrupted through *Jacquemes* to *Jacques* in France, and *James* in England; and *Jacques* being the commonest Christian name in the former country, was used as a contemptuous expression for a common man. *Jacquerie*, an insurrection of the peasants. The introduction of the word in the same sense into England seems to have led to the use of Jack as the familiar synonym of John, which happened to be here the commonest name, as *Jacques* in France. The term was then applied to any mechanical contrivance for replacing the personal service of an attendant, or to an implement subjected to rough and familiar usage.”—Wedgwood’s *Dictionary of English Etymology*. This will be found to explain the very varied use of this word, whether single or in composition, as *boot-jack*, *jack-boots*, *black-jack* (a leather jug for household service). *Jacket* (the diminutive of Jack) is a short coat for homely use.

JACK, **JAK**, or **JACA**, *Artocarpus integrifolia*, a tree of the same genus with the bread-fruit (q.v.), a native of the East Indies. It is a larger tree than the bread-fruit, and has undivided leaves. The fruit is very large, weighing from 5 to 50, sometimes 70 lbs. The fruit, which is produced in very great abundance, resembles the bread-fruit, but is of very inferior quality, the pulp having a strong, unpleasant flavor; yet it forms great part of the food of the natives in some parts of India, Ceylon, etc. The seeds, which lie immediately under the rind, are very palatable when roasted. The timber, which is yellowish, is used for almost every purpose, being both strong and ornamental, and is imported into Britain for making musical instruments, cabinet work, the backs of brushes, marqueterie floors, etc. The Jack is now much planted in many tropical countries of which it is not a native.

JACK-A-LANTERN. See **IGNIS FATUUS**.

JACKAL (corrupted from Sp. and Fr. *chacal*), the common name of a number of species and varieties of the dog genus, abounding in many parts of Asia and Africa, but not found in any of the other quarters of the globe, except that one of the kinds extends into Greece. They agree in all their most important characters with wolves and dogs, and many naturalists suppose that some of the domestic varieties of dog are of jackal parentage. The pupil of the eye is circular, as in the dog and wolf, although the form and tail are somewhat fox-like. The head is narrow, and the muzzle pointed. The ears are erect, and rather large. The tail is not so long as in foxes, but is almost equally bushy. All the jackals are of small size, as compared with wolves, seldom exceeding 15 in. in height at the shoulder. Their colors are buff and tawny, more or less grizzled; the tip of the tail is always dark. They make holes for themselves in the ground by burrowing, or take possession of such as already exist among rocks or ruins; and in these they spend the day, not venturing abroad till the dusk of evening. They

hunt during the night in troops, and their howlings are described by all who have heard them as peculiarly horrible. The notion that the jackal is the *lion's provider*, and guides the royal beast to his prey, is one of the exploded fables of natural history, although it may have some foundation in the lion's occasionally following a troop of jackals in full cry, and appropriating "the lion's share." Jackals are not only ready to devour any animal which they can run down, but any carrion which they may meet with. They follow armies; they dig up the ill-buried dead; they rob hen-roosts and outhouses; but they are as omnivorous as domestic dogs, eating farinaceous or other vegetable food when it comes in their way; they are even said, like foxes, to enter vineyards, and devour the grapes. They have a very offensive smell, which, however, is said to diminish through domestication, and they are domesticated without difficulty. The name of COMMON JACKAL is sometimes given to the species (*canis aureus*) which is found in the western parts of Asia, and which is in general yellowish gray above, and whitish below, with yellow legs and thighs. But it is doubted if this animal was in ancient times plentiful, as it is now, in Syria and neighboring parts of Asia. It is thought not improbable that it may have followed the track of armies from the farther east. It is pretty certain that it has, in comparatively modern times, become common in parts of Asia more northern than it formerly inhabited. It is not improbable, however, that it is included under the name *fox* in the Hebrew Scriptures.

JACKASS, LAUGHING, *Dacelo gigantea*, a bird of the kingfisher family (*halcyonidae*), and sometimes described in works on natural history as the great brown kingfisher. It agrees very nearly with the kingfishers in its form and characters, but differs from them in its habits, not frequenting waters, nor feeding on fish, but preying on beetles, reptiles, and small mammalia. It is about 18 in. long, and mostly of a brown color. It is a common bird in Australia, and has received its English name from the colonists, on account of the peculiar sounds which it utters. The natives call it *gogobera*, apparently in imitation of its cry. It is of great use in preventing the excessive multiplication of reptiles and other pests. Its bill is powerful enough to crush the heads of snakes. It is easily tamed, and is sometimes kept in gardens, from which it does not seek to escape.

JACK BOOTS, tall boots of tough thick leather, reaching above the knee, and formerly worn by cavalry. In some instances, as an additional protection against sword-cuts, they were lined with thin plates of iron. The only regiments in the British service which still retain these handsome but cumbrous boots are the life guards and royal horse guards. See Boots.

JACKDAW (*Corvus monedula*), a species of crow, smaller than the rook and carrion crow, its utmost length being only about 14 inches. It is black, with dark-gray neck. It is a common British bird, and is plentiful also in some parts of continental Europe, Asia, and the n. of Africa. It is not found in America. It builds its nest in holes of cliffs, ruins, etc. It frequents towns and villages, often making its nest in a chimney by dropping down stick after stick till some of them become fixed in their oblique descent; and on these others are piled, affording a firm base for a nest of wool or other soft substance. The jackdaw lays from four to seven (usually five) bluish-white eggs, which are covered with dark-brown spots. Marvelous instances are recorded of the quantity of sticks employed to form a jackdaw's nest, in situations where an unusual height of pile was required. In 1842 a pair of jackdaws, in 17 days, made a pile 10 ft. high in the staircase of the bell-tower of Eton college. The jackdaw is a social bird. It is easily domesticated, and becomes very pert and familiar. It has considerable powers of mimicry, and even imitates the human voice.

JACHMANN, EDUARD KARL EMANUEL; b. Dantzig, 1822; a distinguished naval officer, rising from the position of a common sailor to be a director (1857-9) of the Prussian admiralty. In 1862 he commanded an expedition to China; in 1864 defeated the Danes at the island of Rügen; in 1867 was placed at the head of the naval department; in 1868 was made vice-admiral; and in the Franco-German war (1871), had command of the Baltic fleet, and was commander-in-chief of the whole German navy.

JACITA'RA PALM, *Desmoncus macroacanthus*, a palm found in the forests of the low lands of the Amazon district in South America. It has a slender, flexible stem (see DESMONCUS), often 60 or 70 ft. long. The outer part of the stem, cut into long strips, is much used for making those very strong and elastic plaited cylinders in which the grated root of the mandioc (cassava or tapioca) is squeezed to free it from its poisonous juice. It might probably be found useful for many other purposes, and seems eminently suitable for many kinds of wicker-work.

JACK, a co. in n. Texas, intersected by a fork of Trinity river; 900 sq.m.; pop. '70, 694. It is partly covered with forests. The soil is not much cultivated. Stock-raising is the chief employment. Co. seat, Jacksborough.

JACK SCREW, a machine for raising heavy weights, chiefly buildings of various kinds, as houses and ships. It has various forms, the most powerful being a differential screw. The most convenient form, however, is a single screw and nut, the inclined plane of the screw being as near a horizontal as is consistent with the thickness of the

thread and diameter of the screw. Other devices of the kind are employed, as the hydraulic jack (q.v.).

JACKSON, a co. in n.e. Alabama, bordering on Tennessee and intersected by the Tennessee river; 1100 sq.m.; pop. '80, 25,114. It is hilly, extensively covered with forests, and fertile. The staples are cotton, wheat, maize, grass, and pork. The Memphis and Charleston, and the Nashville and Chattanooga railroads, traverse it. There are several flour and saw mills and tanneries. Co. seat, Stevenson.

JACKSON, a co. in n.e. Arkansas; bounded n.w. by Black river, and traversed by White river and the Cairo and Fulton railroad; 600 sq.m.; pop. '80, 10,877. It is level, well wooded, and fertile. The staple products are cotton, maize, hay, and fruits. Co. seat, Jacksonport.

JACKSON, a co. in n. Florida, bordering on Alabama; bounded e. by the Chattahoochee and Appalachicola rivers, and drained by the Chipola; pop. '80, 14,372. The surface is level, and partly covered with pine forests. The soil is fertile, producing cotton, rice, sugar-cane, maize, and tobacco. Co. seat, Marianna.

JACKSON, a co. in n.e. Georgia; 450 sq.m.; pop. '80, 16,298. It is drained by two branches of the Oconee river, and intersected by the North-eastern railroad. It is hilly and well wooded. The staple products are cotton, maize, wheat, tobacco, and pork. Iron and granite abound. Co. seat, Jefferson.

JACKSON, a co. in s. Illinois; bounded s.w. by the Mississippi river, and drained by the Big Muddy; 580 sq.m.; pop. '70, 19,634. It is traversed by the Illinois Central, the Grand Tower and Carbondale, and the Cairo and St. Louis railroads. It is hilly and mostly covered with forest trees. The soil is fertile, producing wheat, maize, oats, tobacco, fruits, and pork. It has abundant coal-beds, salt-springs, and quarries of limestone, and several manufactories and mills. Co. seat, Murphysborough.

JACKSON, a co. in s. Indiana, 560 sq.m.; pop. '70, 18,974. It is drained by the e. fork of White river; bounded s. by the Muscatatuck, and traversed by the Ohio and Mississippi, and the Jeffersonville, Madison, and Indianapolis railroads. The surface is undulating, and much of it covered with forests. The soil is fertile. The staples are wheat, oats, maize, fruits, and pork. There are numerous carriage and woolen factories and flour and saw mills. Co. seat, Brownstown.

JACKSON, a co. in e. Iowa; bounded n.e. and e. by the Mississippi, and intersected by the Maquoketa; 628 sq.m.; pop. '75, 23,062. The surface is broken, well wooded, and the soil very fertile. The staples are wheat, oats, maize, hay, butter, and cattle. Mines of iron and lead are found. The co. is traversed by the Sabula, Ackley, and Dakota, and Iowa Midland railroads. The chief articles of manufacture are carriages, furniture, and saddlery. There are numerous flour and saw mills. Co. seat, Maquoketa.

JACKSON, a co. in n.e. Kansas; 658 sq.m.; pop. '78, 7,930. It is drained by Bills and Straight creeks. The Kansas Central, and the central Branch of the Union Pacific railroads intersect it. The surface is varied with prairie and woodland. The soil is fertile. The staples are maize, oats, wheat, hay, and live stock. This co. is part of the coal-field of Kansas. Co. seat, Holton.

JACKSON, a co. in s.e. central Kentucky; 300 sq.m.; pop. '80, 6,678. It is drained by the forks of Rock Castle river. The surface is hilly, and about half-covered with forests. The soil is fertile, producing maize and grass. Co. seat, McKee.

JACKSON, a parish in n. Louisiana; 730 sq.m.; pop. '80, 5,328. It is drained by Dugdemonia river and some bayous. The surface is uneven, and covered extensively with forests. The soil is generally fertile. The staples are cotton, maize, sweet potatoes, and pork. Co. seat, Vernon.

JACKSON, a co. in s. Michigan; drained by the Grand, Kalamazoo, and Raisin rivers; 720 sq.m.; pop. '80, 42,031. It is traversed by the Michigan Central and Grand River railroads, and by others connecting with these at Jackson. The surface is nearly level, and extensively covered with forests. The soil is a sandy but fertile loam. The staples are wheat, maize, oats, wool, and butter. The co. has iron, bituminous coal, limestone, and sandstone. There are numerous factories for carriages, agricultural implements, boots and shoes, and saddlery; also flour and saw mills. Co. seat, Jackson.

JACKSON, a co. in s. Minnesota, bordering on Iowa; 720 sq.m.; pop. '80, 4,806. It is intersected by the Des Moines and Chanyuska rivers. The surface is diversified with prairies and numerous lakes, the largest of which is Heron lake. The soil is fertile, producing wheat, oats, potatoes, and grass. The co. is traversed by the Sioux City and St. Paul railroad. Co. seat, Jackson.

JACKSON, a co. in s.e. Mississippi; bounded e. by Alabama, and intersected by the Pascagoula and Escatawpa rivers; 950 sq.m.; pop. '70, 4,362. It is level, sandy, and mostly covered with pines. The productions are chiefly rice, maize, and potatoes. It is crossed by the New Orleans, Mobile, and Texas railroad. Lumber is largely exported to New Orleans. Co. seat, Scranton.

JACKSON, a co. in w. Missouri; bounded w. by Kansas, n. by the Missouri river, and drained by Big Blue and Little Blue rivers; 650 sq.m.; pop. '80, 82,364. It has a fertile limestone soil, and an uneven surface partly covered with forests. The Missouri Pacific railroad crosses it, and other important railroads have their terminus at Kansas City. The staple products are wheat, oats, maize, grass, and live stock. Limestone is abundant. There are many manufactories for carriages, furniture, saddlery, clothing, cigars, etc., and some flour and saw mills. This co. ranks second in the state for population and wealth. Co. seat, Independence.

JACKSON, a co. in s.w. North Carolina, bordering on South Carolina; 600 sq.m.; pop. '80, 7,343. It is drained by the Tuckasegee river. It is mountainous, and to a great extent covered with forests. The soil is fertile. The staples are maize, wool, grass, and pork. Iron, gold, and marble are found. Co. seat, Webster.

JACKSON, a co. in s. Ohio; drained by the Little Scioto river and Symmes creek; 400 sq.m.; pop. '70, 21,759. It is hilly and well timbered. The soil is generally fertile, producing wheat, oats, maize, and hay. Iron and bituminous coal are abundant, and beds of limestone are numerous. There are several manufactories, flour and saw mills. It is traversed by the Marietta and Cincinnati railroad. Co. seat, Jackson.

JACKSON, a co. in s.w. Oregon; bounded s. by California; 3,000 sq.m.; pop. '80, 8,154. It is traversed by the Cascade and other mountain ranges. The western part is drained by Rogue river, and is fertile; but much of the eastern is uncultivated. The surface is uneven, and much of it covered with forests. The climate is very various. Gold and iron have been found. The staples are wheat, barley, oats, maize, and live-stock. Co. seat, Jacksonville.

JACKSON, a co. of middle Tennessee; 300 sq.m.; pop. '70, 12,583. The northern part originally included Clay co., which now separates it from Kentucky. The surface is irregular and covered extensively with forests. The soil is fertile, producing wheat, maize, tobacco, and grass. Co. seat, Gainesborough.

JACKSON, a co. in s. Texas; 800 sq.m.; pop. '80, 2,723. It is drained by the Lavaca and Navidad rivers. The s.w. part borders on Lavaca bay. The surface is prairie and woodland. The soil is generally fertile. The staples are cotton, maize, grass, and cattle. Co. seat, Texana.

JACKSON, a co. in w. West Virginia, bounded n.w. by the Ohio river; 440 sq.m.; pop. '70, 10,300. It is hilly, and a large part is covered with forests. The soil is generally fertile, producing maize, wheat, oats, and tobacco. Limestone is found. Co. seat, Jackson Court-house, sometimes called Ripley.

JACKSON, a co. in w. Wisconsin; 1000 sq.m.; pop. '75, 11,339. It is intersected by Black river, and in part drained by Fox river and some creeks. The surface is irregular and well wooded. The soil is generally good. The staples are wheat, oats, maize, grass, and lumber. The West Wisconsin railroad crosses the county.

JACKSON, a flourishing city in the state of Michigan, United States, is situated on the left bank of the Grand river, 76 m. w. of Detroit, and 35 m. s. of Lansing, at the intersection of six railways. There are manufactures of chemicals, bricks, agricultural implements, furniture, and wagons; foundries, machine-shops, rolling-mills, breweries, flour-mills, etc. There is a flourishing general trade. Within the city limits there are two mines of bituminous coal; that material occurs also in the vicinity. Pop. '80, 42,031.

JACKSON (*ante*), the co. seat of Jackson co., Michigan, on the Michigan Central railroad, 94 m. s.e. of Grand Rapids. It is a city of great commercial activity, and is in a prosperous farming region. Pop. '80, 16,121. It was incorporated 1857, and has 5 banks, 16 churches, 2 large union and several graded public schools, gas-works, and Holly water-works. Among the public buildings are the state prison, built of stone, 500 ft. long, inclosing 8 acres; the finest passenger station in the state, built by the Michigan railroad company, and the principal railroad machine shops. There is a business college, and a young men's library of 2,500 vols.

JACKSON, capital of the state of Mississippi, United States, is situated on a plain on the right bank of the Pearl river, which becomes navigable here, 40 m. e. of Vicksburg, and about 180 m. n. of New Orleans by railway. Being the capital, it is the seat of several important state institutions, as the lunatic asylum, institutions for the deaf and dumb, and the prison. Here, in average years, from 30,000 to 40,000 bales of cotton are shipped annually. Pop. '70, 4,234.

JACKSON (*ante*), the capital of Mississippi, at the junction of the New Orleans, Jackson, and Great Northern, and the Vicksburg and Meridian railroads; pop. about 7,000. It has a large trade in cotton. It has 8 churches, 3 banks, a high school and private schools, a state library of 15,000 vols., 2 hotels, a city hall, street cars, a fire department; 2 iron foundries, sash, door and blind factories. The chief public buildings are the state-house, penitentiary and institutions for deaf-mutes, the blind, and insane. In the war of the rebellion the city was occupied by the federal troops, and much of it destroyed, but it has been rebuilt, and is now prosperous.

JACKSON, a city of Tenn., co. seat of Madison co.; pop. '74, about 8,000. It is on the s. fork of Forked Deer river, and at the junction of the Mobile and Ohio with the New Orleans, St. Louis and Chicago railroads. It is 90 m. n.e. of Memphis, and 107 s.e. of Cairo, Ill. It has 13 churches, a court-house, a national bank, 5 hotels, an opera-house, 5 newspapers, gas-works, planing and flour mills, soda-water manufactories, and the machine shops of the railroad companies. Here are West Tennessee college, the South-western university, founded 1874, several seminaries for girls, and some public schools. Jackson is in a fertile region, and has a growing trade. The chief article of export is cotton.

JACKSON, ABRAHAM REEVES, b. Philadelphia, 1827; received degree of doctor of medicine from the Pennsylvania medical college in 1848; practiced in Stroudsburg, Penn., and Chicago, Ill. In 1872 he was elected professor in the Rush medical college. He was an honorary member of several medical societies, and author of numerous medical works.

JACKSON, ANDREW, Gen., and seventh president of the United States of America, was b. at Waxhaw settlement, S. C., Mar. 15, 1767. His father, who was a Scotchman by birth, emigrated to America in 1765, and soon afterward died, leaving to his widow a half-cleared farm in a new settlement, with no negroes to assist in its cultivation. When Jackson grew up he was sent to study for the church, but on the breaking out of the American revolution he and his brothers were summoned to the field, and the elder lost his life at Stono Ferry. Andrew, though but 13 years old, fought with his remaining brother under Sumter, and remained with the army until the end of the war. The life of the camp had ruined him for the clerical office, so in 1784 he commenced the study of the law, and in 1787 was appointed solicitor for the western district of South Carolina, now the state of Tennessee. This frontier settlement had for its neighbors several powerful tribes of Indians, against whom Jackson fought with such success as to get from them the complimentary titles of "Sharp Knife" and "Pointed Arrow." In 1796 he was a member of the convention which modeled the constitution and organized the state of Tennessee, and was elected to the legislature as representative, and then as senator, and appointed judge of the supreme court (an office he soon resigned), and maj.gen. of the state militia. In 1813, at an outbreak of hostilities with the Creek Indians, he raised a volunteer force of 2,000 or 3,000 men, and defeated them. When destitute of supplies he is said to have set an example of endurance by feeding on hickory nuts, and hence, according to some, to have acquired the popular sobriquet of "Old Hickory." Jackson's final victory (Mar. 27, 1814) at the Horseshoe peninsula, in the Tallahosa, completely broke the power of the Indian race in North America. In consequence of his skill and energy in Indian warfare he was appointed a maj.gen. of the army of the United States; and in the contemporaneous war with England had command of the forces which captured Pensacola, and defended New Orleans (q.v.) against the attack of the British under gen. Packenham, Dec., 1814. The result of this action, so flattering to the pride of Americans, gave gen. Jackson a great and enduring popularity. After Spain had ceded Florida to the United States he was made gov. of the territory, and subsequently was chosen U. S. senator from Tennessee. In 1824 he received the highest vote of four candidates for the presidency of the United States, but by the influence of Mr. Clay, John Quincy Adams was elected by the house of representatives. He was, however, in spite of bitter and violent opposition, elected by the democratic party in 1828, and in 1832 re-elected by a still more overwhelming majority. His administration was marked by singular firmness. He vetoed important measures against large majorities, and after a long struggle destroyed the bank of the United States, and took the first steps toward a specie currency and independent treasury. But he manifested too much, perhaps, of a partisan spirit in removing nearly all his political opponents from office, and appointing his supporters—an example followed by his successors of both parties, and which has led to wide corruption. His administration, as a whole, was successful, and he retired with undiminished popularity, after witnessing the election of his favorite, president Van Buren. He died at his farm of the Hermitage, near Nashville, June 8, 1845.

JACKSON, ANDREW, LL.D. (*ante*); 1767-1845; b. N. C.; seventh president of the United States. In boyhood he was far more fond of sports than of books, but these sports were soon exchanged for serious work. Though but eight years old when the battle of Lexington occurred, before the war was over he took an active part on the patriot side. In 1781 he and his brother Robert were taken prisoners. The English commander directed Andrew to brush his boots, but the spirited boy indignantly refused, whereupon the Englishman struck him with his sword, inflicting a wound upon his arm and another upon his head; at the same time Robert was knocked down. Andrew was put in prison at Camden, S. C., where he saw the defeat of gen. Greene at Hobkirk hill. The mother procured the exchange of the boy soldiers and took them to her home in Waxhaw, where Robert died from small-pox, and for many months Andrew was very ill. The patriotic mother left her home to nurse Americans in prison at Charleston, and there died of fever. Andrew was alone in the world, and without means; but he went to work for a saddle-maker, adding the incongruous employment of teaching school. His next step was to study law at Salisbury, N. C., but the books of Blackstone were

not so attractive to his mind as a good horse-race or other exhilarating sport. While yet under twenty he was admitted to the bar as attorney and counselor, and in 1788 was appointed public prosecutor in the region now forming the state of Tennessee. It was a new and wild country, and in the prosecution of his duties Jackson had to travel long distances, often at the risk of death from the Indians. Of such traveling, chiefly on horseback, he had about 1000 m. every year. In 1791 he married Rachel Robards, a daughter of John Donelson, one of the pioneer settlers of Tennessee. The marriage was the cause of considerable severe comment from the fact that the woman was divorced under peculiar circumstances. She had been the wife of Lewis Robards, a Kentuckian. She was boarding with Mrs. Donelson, who was then a widow, when Jackson took rooms in the same house. Robards soon afterwards applied to the legislature for an act looking to a divorce, charging his wife with undue familiarity with the young lawyer. The bill was passed, and Jackson supposed it to be a full divorce; so the pair married two years before the divorce provided for by the legislative act (which was to be decreed by a jury) took effect. They married over again; but the union was not happy, and its effects were felt by Jackson even while he was in the executive chair.

When Tennessee was organized as a territory Jackson was made district attorney. In 1796 he was a member of the convention to frame a state constitution, and was on the committee to draft that document. In the same year he was chosen to congress, taking his seat in December. His political sympathies were with Jefferson, and he was one of the twelve who opposed the offering of an address to Washington in answer to his last message to congress, on the ground that he could not approve of all the doings of the administration. Jackson's first work in the house of representatives was a speech in favor of remuneration for services against the Indians. He voted for a tax on slaves, and against furnishing the president's house unless very plainly. Except that he favored the building of three vessels of war, and opposed the purchase of peace from the Algerine pirates, he did nothing more in that congress. But his course pleased his constituents, and he was sent to the U. S. senate in 1797. In that body he was perfectly dumb, neither making a speech nor casting a vote. In April, 1798, he resigned, and was chosen a judge of the supreme court of Tennessee, in which capacity he had to travel over the state on a salary of \$600 a year. At this time he came near having his first passage-at-arms with gov. Sevier, whom he suspected of being concerned in land frauds. A duel was expected, but friends interfered and prevented it. In 1798 a failure in Philadelphia embarrassed Jackson financially; but he resigned his judicial office, sold a large amount of property, and cleared himself from debt. In 1804 he removed to a log-house, afterwards known as "the Hermitage," and engaged largely in the raising of corn, cotton, wheat, horses, and cattle. He was the head of a trading firm, and was doing a large business, when the firm failed in consequence of acts done without Jackson's knowledge. The first of his duels was with Charles Dickinson, who had used objectionable language respecting Mrs. Jackson. They fought at eight paces; Jackson had a rib broken, and Dickinson was killed.

In 1805 Aaron Burr appeared in the southwest and easily enlisted Jackson in his plans for war with Spain, the seizure of Mexico, etc. A ball was given in Burr's honor, and Jackson, in full military costume, introduced the guest to his hosts. In Nov. Jackson supplied Burr with boats and provisions; but a few days later, having cause to suspect the adventurer, he ordered that no further dealings should be had with him, at the same time writing to Burr and demanding the truth. He also wrote to gov. Claiborne of Orleans territory (now Louisiana) and to president Jefferson. Yet he was Burr's friend, and during the trial of the latter at Richmond, although summoned as a witness, he was zealous in his defense. Jackson favored the nomination of Monroe for president; but for some years he avoided politics, living quietly at the Hermitage and attending solely to the raising of crops and cattle.

The declaration of war against Great Britain in 1812 brought to the hero of that war his opportunity. As soon as he heard the news he offered his own services and the co-operation of 2,500 militia under his control. The proposition was gladly accepted, and in Oct. the governor of Tennessee was requested to forward 1500 men to New Orleans. Jackson assembled the men at Nashville, and 2,000 infantry and cavalry were equipped. Early in Dec. the infantry were sent down the river in boats, while the cavalry made their way overland. The forces reassembled at Natchez, where they remained under orders from Feb. 15. Near the last of Mar. orders came from Washington to dismiss the men, but Jackson conducted them back to Tennessee before obeying the order. It is said that in consequence of his courage and endurance at this time his men gave him the *soubriquet* of "Hickory," which was the origin of the "Old Hickory" of later years. The men were dismissed in May, after another tender of service to which Jackson received no answer. He had assumed responsibility for the transportation of his men, but the government permitted his paper to go to protest, and he was on the verge of financial wreck, when a friend, Thomas Hart Benton, afterwards the great Missouri senator, came to his rescue, and, by appealing "from the justice to the fears" of the party in power, finally secured justice. The next incident in the stirring life of Jackson was the Benton fracas. A friend of Jackson named Carroll had a quarrel with and sent a challenge to Jesse Benton, a brother of Thomas H.; Jackson became Carroll's second, and for a time put off the contest. The challenged party sent

to his brother in Washington an account of the affair, which was intended to, or at least did, create prejudice against Jackson in the mind of his especial friend. A fiery correspondence followed between Thomas H. Benton and Jackson, and in the course of oral comment Benton used some of the strongest language of which he was master, all of which was made known to Jackson, who was wrought up to the highest pitch of passion. He declared that he would horsewhip Benton on sight. Early in Sept. Jackson and col. Coffee met the two Bentons in the street at Nashville. Jackson called to Benton to defend himself, and made a movement towards him, while Benton tried to get hold of a pistol. Jackson got his pistol soonest and took aim, his antagonist retreating and he following to the rear door of a hotel, where Jesse Benton fired and put two or more balls into Jackson's left shoulder. Jackson fell; Coffee fired, but missed Benton; then turned upon Thomas H. Benton, when the latter fell down a flight of steps. A nephew of Mrs. Jackson, named Hayes, then mingled in the fray, making a desperate attack upon Jesse with sword-cane and dagger, finally throwing him down and wounding him in a number of places. The interference of an outsider saved Jesse's life, and the fight ended. The physicians decided that Jackson's arm should be taken off, but he would not listen to them, and his resolution saved that member of his body to hold the bridle in many a more honorable encounter.

Ever since the earliest attempts to remove the Georgia Indians from their territory there had been intermittent wars. Emboldened by the war with England, the Creeks in 1813 made further trouble and committed many outrages, the chief of which was the massacre at Fort Mimms, Aug. 30. Intense excitement followed, and the whole southwest was aroused. The Tennessee legislature called for volunteers, and resolved to exterminate the troublesome tribe. Jackson was in bed, nursing his shattered shoulder, but he dictated addresses and was in spirit in the field. Although his wound still caused intense pain, he joined his division Oct. 7, and on the 11th they marched, and for 32 m. at the rate of five and one-third miles an hour, to overtake the Indians, which, however, they failed to do. Nov. 3 col. Coffee defeated the Indians, and on the 9th Jackson gave them a crushing blow at Talladega. But the commissariat was badly managed, and Jackson's men were almost in mutiny, from which cause these victories were of much less consequence than they would have been under favorable conditions. In Jan., 1814, Jackson, with less than 1000 men, invaded the Indian territory, winning two important victories before the close of the month. In both fights his skill and courage were conspicuous. In Feb. he had a new force of 5,000 men, with whom he followed the Indians, who had made their final stand at Tohopeka on the Tallapoosa, on a small peninsula called the Horseshoe. The position was strong, but the Indian force was weak; Jackson captured the place Mar. 27, and of the 900 Indians 750 were killed, the white loss being 201. This defeat was the end of wars with the Creeks, and thereafter the Indians of Georgia and Alabama submitted to fate and removed to the territory set apart for them w. of the Mississippi. A few months later Jackson and col. Hawkins made with the Indians the treaty of fort Jackson, on which occasion the leading chiefs desired to present Jackson with a tract of nearly 6,000 acres of land, but congress would not permit him to accept.

May 31, 1814, Jackson was made a maj.gen. of the regular army, and was looked upon as the leader in the s. w. The British were preparing for a formidable attack upon Mobile, and thither Jackson went in July. The enemy were making free use of the Spanish port of Pensacola, where they arranged two expeditions against the United States, and at the same time stirred up the Indians of Florida (then belonging to Spain) to hostilities against the white settlements in Georgia. The Spaniards lacked the disposition even if they had the power to stop this abuse, as was shown when the English commander made his head-quarters in the mansion of the Spanish governor. Jackson determined to take possession of Pensacola, and wrote to Washington for permission, but it was six months before the answer came. He wrote a protest to the Spanish governor, to which no attention was paid. He then "took the responsibility," called upon his Tennessee veterans, and prepared to seize the Spanish port. He put a force into a small unfinished fort (Bowyer) on Mobile bay, under command of maj. Lawrence. This place the English attacked by sea Sept. 15, but they were driven off, losing one of their vessels and 72 men. At this time occurred an event for which Jackson received more censure than from all other acts of his life. There had been a mutiny among the Tennessee troops whereby Coffee's reinforcements had been delayed. Jackson hung six of the offenders, thereby ending mutiny in armies under his command. At length he was ready, and marched upon Pensacola with 3,000 men. Negotiations were proposed, but he was not there to talk; he took the place Nov. 6; the English blew up the fort that defended the harbor, went aboard their ships, and left the bay. Two days later he was again in Mobile, expecting an attack from the English. There being no prospect of such attack, he sent the greater part of his troops to New Orleans, and arrived there himself Dec. 2, 1814. The place had no defenses worth notice, and but for their proverbial slowness the English might have taken it almost without effort. Jackson knew they were coming, and made preparations for their reception. On the 14th the English seized five American gunboats and a schooner, clearing the course up the river to New Orleans; but they did not avail themselves of the advantage. On the 15th Jackson, who had already called out the entire militia, proclaimed martial law.

He had a motley army, comprising a few regulars, militia from the neighboring states, privateers from Barataria, and one battalion of negroes. On the 16th the British advanced landed, and came within 9 m. of the city on the morning of the 23d. Learning the facts early in the afternoon, Jackson hastily gathered a force of 2,130 (of whom only 1800 were in the engagement), and with the assistance of a solitary schooner made an attack, the result of which, after a very sharp conflict, was decidedly to the advantage of the Americans. The advance upon the city was checked, and, had not large additions been made to the British force during the night, there would have been a substantial American victory. It is generally believed that this check, and the remarkable caution with which the British moved, saved New Orleans from capture. After that battle Jackson retired to a canal about 4 m. from the city, where he prepared for defense from whatever quarter an attack might come. Packenham arrived on Christmas day and made many changes in the disposition of the British troops. On the 28th he made an attack, but was repulsed. He made another effort on New Year's day, chiefly with artillery, and this was not only a repulse but a defeat. These results were due to Jackson's incessant activity, and the spirit which he had aroused among his men. He greatly annoyed the enemy by sudden attacks in the night, and by other means kept them in constant alarm. Jan. 12, 2,250 Kentuckians came to Jackson, but were of little use as their arms were delayed on the river. On the 6th the English gathered all their forces, including marines and seamen, the number being about 14,000, though English authorities declared that 8,000 was the right count, while they absurdly insisted that the Americans had 25,000. (Jackson had about 4,000 men.) The American line was on the left bank of the river in a very strong position; it was about 1700 yards long, and manned by 12 guns and 3,200 men. The handling of the guns under lieut. Armstrong (afterwards gen.) was most effective. In the first assault upon Jackson's line the British commander Packenham was killed, and another gen. mortally wounded. A second assault produced no impression, the well-directed fire of the Americans being too terrible to face. A battery near the river was captured by the English after the loss of three-fourths of the assailants, but it was quickly abandoned. The famous 93d Highlanders, who had won distinction in many parts of the world, lost half their number. After losing heavily and seeing no prospects of success, gen. Lambert, who had succeeded Packenham, proposed an armistice. But while the British had been so badly beaten before Jackson's line they had gained decided success on the other side of the river, from which position they might be troublesome. In granting the armistice, therefore, Jackson required that it should not take effect on the other side, nor should either party send reinforcements there. This was agreed to, and in doing so the English abandoned their only advantage. The armistice ended the attempt to capture New Orleans and control the great river. The British retired with a loss of about 2,000 in all; the loss on the other side was seven killed and six wounded. The battle of New Orleans, which crowned Jackson with fame, was fought Sunday, Jan. 8, 1815, some weeks after the signing of the treaty of peace at Ghent. The anniversary of the day was for many years celebrated with enthusiasm surpassed only by the rejoicings on July 4. Following the war there were many legal troubles in which Jackson was involved, the most notable of which was a fine of \$1000 for contempt of court, the contempt being the arrest of judge Hall during the time of martial law. Jackson refused pecuniary assistance and paid the fine. Nearly 30 years afterwards, and only a year before his death, congress refunded the fine with interest.

In April, 1815, Jackson was appointed commander-in-chief of the southern division, and congress voted thanks for his services. His next active work was in the Seminole Indian war, in the course of which occurred another of his acts which created no little excitement. At the Spanish fort of St. Marks, of which he had taken possession, was one Arbuthnot, a Scotchman, whom he arrested; and at Suwanee he arrested a native of the Bahamas named Ambrister. These men (British subjects) were tried by court-martial, and declared guilty of inciting the Indians to war and supplying them with arms, and the sentence of death was immediately executed. At the same time Jackson hung two Indian chiefs, and then seized Pensacola in spite of the remonstrance of the Spaniards. These proceedings created intense excitement in England; but after much angry correspondence there was a peaceable settlement. In congress Jackson's conduct was very generally condemned, but all attempts to pass a vote of censure failed. As for himself, at this time, he was in constant and towering passion. He believed that his action was in accordance with the desires of the administration, and the criticisms so freely made were as goads to his hot temper, carrying him so far that he threatened to cut off the ears of certain free-speaking senators. In 1819 Jackson went as far north as New York, and was well received, but with little cordiality. On the cession of Florida to the United States he was appointed governor, and during his brief term of office had some serious difficulties in consequence of the arrest of a judge for issuing a writ of *habeas corpus*. Efforts in congress to pass censure for this act were not successful. In 1822 he was offered but refused to accept the Spanish mission.

The Seminole war closed Jackson's military career, and with no inclination of his own he was again taken into political life. In 1823 the legislature of Tennessee elected him to the U. S. senate, and at the same time nominated him for president. (At that time all nominations for the chief executive office were made by caucuses of state

legislatures.) At the election the next year there were four candidates who received electoral votes as follows: John Quincy Adams 84, Wm. H. Crawford 41, Henry Clay 37, and Jackson 99. No one having a majority the house of representatives elected Adams, and Jackson retired to private life. But four years afterwards he was supported by all the opponents of the administration, and elected by an immense majority—the vote being Jackson 178, Adams 83. The contest was one of the most personal and bitter in American political history. Mrs. Jackson died almost as soon as she knew of her husband's election.

Jackson's eight years' administration of the government was neither better nor worse than had preceded. The chief innovation was in the general sweeping of men out of office on account of their party opinions. Up to his time there had been few removals on such grounds; but he adopted Gov. Marcy's doctrine that "to the victors belong the spoil of the vanquished," and it may be added that every party from that day to this has followed in his footsteps. The leading facts of Jackson's administration were the scandal concerning Mrs. Eaton, whereby the cabinet was broken up; the veto of the U. S. bank charter; the removal of the deposits of public money from that bank; and particularly the prompt and complete crushing of the contemplated secession of South Carolina in 1832. This movement was started in opposition to a high tariff, and Jackson himself was opposed to such a tariff; but he gave the South Carolinians to know, in language not to be misunderstood, that while the laws remained unrepealed they should be enforced at any hazard. Before any serious acts had occurred the matter was settled through the influence of Henry Clay and others. During his second term Jackson was engaged in the "bank war." He ordered the secretary of the treasury to stop making deposits of public money in the U. S. bank and its branches. The cabinet were not favorable to such a policy, and Jackson put William J. Duane at the head of the treasury, but as he declined to do the required service he was displaced and Roger B. Taney was appointed. Taney obeyed Jackson's order, and in retaliation the senate refused to confirm his nomination as secretary. (He was subsequently made chief-justice of the U. S. supreme court.) Feeling ran so high in this bank war that the senate passed a resolution of censure on the president, a proceeding unheard of till then. In 1837 this resolution was by vote expunged from the record. The "bank war" closed in 1836-37; the old bank was not re-chartered; and after some time the independent treasury or "sub-treasury" was invented to take its place as a depository for public money. During Jackson's terms the national debt was entirely paid off; the Indians were removed from Georgia, and nearly all of them from Florida, although enough were left to make the second Seminole war; and two states, Arkansas and Michigan, were admitted to the union. The chief disturbing elements were the question of slavery and the great financial panic, which was just beginning when he left the chair in Mar., 1837. On quitting office he published a farewell address and retired to the Hermitage, where he passed the remainder of his life, always, however, taking a deep interest in public affairs. Dropsy was the direct cause of his death; but he had through life been suffering from various diseases, and to these circumstances his friends ascribed much of his irritability of temper. His honesty in intent and act was never doubted; with all his harshness he was charitable; and in his later years made a free and open profession of the Christian faith, which he had always intellectually accepted.

JACKSON, CHARLES, LL.D.; 1775-1855; b. Mass.; graduated at Harvard college, 1793; studied law with chief-justice Parsons, and commencing practice in 1796 at Newburyport, rose to a high rank at the bar. In 1803 he removed to Boston, where, associated with Judge Hubbard, he had the most lucrative practice in the state, and was among the most distinguished of the profession. He was judge of the Massachusetts supreme court, 1813-24; a member of the state constitutional convention in 1820; appointed one of the commissioners to revise the state laws in 1833, and in 1828 published a *Treatise on the Pleadings and Practice in Real Actions*, a standard work on the law of property.

JACKSON, CHARLES THOMAS; b. Mass., 1805; studied medicine in Boston, and received his medical degree from Harvard college in 1829. In 1827-29, in company with Francis Alger of Boston, he made a mineralogical and geological survey of Nova Scotia, an account of which is contained in *Memoirs of the Am. Academy of Arts and Sciences*. He visited Europe in 1829, spending three years in study in Paris. In 1831 he made a pedestrian tour through central Europe. He was at Vienna during the prevalence of cholera, and assisted in the dissection of 200 bodies of the victims. In 1833 he began the practice of medicine in Boston, but relinquishing it, devoted himself to chemistry, mineralogy, and geology. In 1836 he was state geologist of Maine; in 1839, of Rhode Island; and in 1840, of New Hampshire. In 1837 he had a controversy with Prof. Morse, claiming the invention of the telegraph. In 1844 he explored the wilderness on the southern shore of Lake Superior, and (1847-49) was U. S. surveyor of mineral lands in Michigan. Dr. Jackson claimed to be the discoverer of anaesthetics, but his claims were disputed by Dr. W. T. G. Morton, and Dr. Horace Wells, which gave rise to a protracted controversy. A memorial signed by 143 physicians of Boston and vicinity, claiming for him the exclusive discovery, was presented in 1852 to congress. A com-

mittee of the French academy of sciences, about the same time investigated the matter, and decreed a prize to both Jackson and Morton. Dr. Jackson has received many honors from foreign societies and governments. He has contributed valuable articles to the *American Journal of Science and Arts*, to the *Comptes Rendus*, and to the *Bulletin de la Société Géologique de France*. His geological reports and chemical reports for the U. S. patent office were also published, and a *Manual of Etherization*, 1861.

JACKSON, HENRY ROOTES; b. Georgia, 1820; admitted to the bar in 1840; was several years U. S. district attorney for the state; was col. of a regiment in the Mexican war in 1846; judge of the circuit court, 1849-53, when he was appointed *chargé d' affaires* at Vienna, remaining there as minister resident 1854-58. After the secession of Georgia he accepted the office of confederate judge for the state, which he resigned, and was made a brig. gen. in the rebel army. He was under Hood in Tennessee; captured at the battle of Nashville in 1864; taken as a prisoner of war to Johnson's island, thence to fort Warren, where he remained till the close of the war. In his early life he contributed to literary periodicals, and in 1851 published *Tallulah, and other Poems*.

JACKSON, JAMES; 1757-1806; b. Devonshire, England; removed 1772 to Georgia, and in 1776 took an active part in repelling the British from Savannah; in 1778 was made brigade maj. of the Georgia militia, and when Savannah, which he had defended, fell, he fled to South Carolina, and joined gen. Moultrie; in 1781 he was at the battle of Cowpens as brigade maj. to gen. Pickens. When Augusta was besieged he was put in command of the garrison after the expulsion of the British. After the war the Georgia legislature presented him a house and lot. In 1789 he was chosen governor, but declined; was a member of the first congress under the new constitution in 1789; was U. S. senator 1793-96; took part in framing the constitution of Georgia in 1798, and was governor 1798-1801. While in congress he opposed the bill for the suppression of the slave trade.

JACKSON, JAMES, LL.D.; 1777-1867; b. Mass.; graduated at Harvard college, 1796; studied medicine with Dr. Holyoke of Salem, and in London. Returning, he began practice in Boston in 1800. He was the first physician of the general hospital in Boston, which, with Dr. Warren, he established. In 1810 he was chosen professor of clinical medicine in Harvard university, and in 1812 professor of theory and practice. In 1835 he was made professor emeritus. He was several times elected president of the Mass. medical society. His principal productions are: *On the Brunonian System*, 1809; *Remarks on the Medical Effects of Deutrition*, 1812; various articles in the *Transactions of the Mass. Medical Society*; *Syllabus of Lectures*, 1816; *Eulogy on Dr. John Warren*, 1815; *Text Book of Lectures*, 1825-27; *Memoir of his Son, James Jackson, Jr.*, 1835; *Letters to a Young Physician*, 1855. He contributed many articles to the Boston medical and surgical journals.

JACKSON, JOHN, 1686-1763; b. England; graduated at Cambridge; was rector of Rassington and master of Wigton hospital. He afterwards published many treatises advocating Arian or Unitarian tenets, and wrote against Collins and Tindal. In 1752 he published a useful work on chronological antiquities.

JACKSON, JOHN, 1778-1831; b. England; an eminent portrait painter. The son of a poor tailor, he attracted the notice of lord Mulgrave and sir George Beaumont by the great taste for drawing which he displayed; and leaving his father, to whom he was apprenticed, he removed to London, and through their favor studied at the royal academy. He soon rose to distinction as a portrait painter, and in 1817 became a royal academician. Visiting Italy in 1819 he was made a member of the academy of St. Luke at Rome. He is considered one of the ablest pupils of the Reynolds school. Though he painted with remarkable rapidity, his pictures show always a careful finish. He was a man of sincere piety, rejoiced in the success of other artists, and was ready to aid promising youth in their struggles with poverty.

JACKSON, JOHN, D.D.; b. London, 1811; graduated with high honor at Oxford, 1833; was rector of St. James, Piccadilly, in 1846; chaplain to the queen in 1847; canon of Bristol in 1852; bishop of Lincoln in 1853. In 1845, 1850, 1862, 1866, he was preacher before the university of Oxford; in 1853 delivered the Boyle lecture; and in 1869 was appointed bishop of London.

JACKSON, JONATHAN, 1743-1810; b. Boston; graduated at Harvard college, 1761; was a wealthy merchant at Newburyport; a member of the provincial congress in 1775; a representative in 1777; a member of the old congress in 1782; a state senator in 1789; marshal of the district of Massachusetts, state treasurer, and president of the state bank. He published *Thoughts on the Political Situation of the United States*.

JACKSON, PATRICK TRACY, 1780-1847; b. Mass.; brother of Dr. James Jackson; was apprenticed at the age of 18 to a merchant, and engaged afterwards in Boston in the Indian trade, in which he acquired a fortune. With his brother-in-law, Francis C. Lowell of Boston, he engaged in the cotton manufacture, and after several experiments succeeded in producing a model from which a power-loom was constructed in 1812 by Paul Moody. They built their first mill in 1813 at Waltham, the first that converted the raw cotton into cloth. In 1821 he purchased land on the Merrimack river, on which the Merrimack Manufacturing company erected a number of mills under his auspices.

This was the site of the present city of Lowell. In 1830 he obtained a charter for a railroad from Lowell to Boston, which, under his direction, was completed in 1835. Having experienced severe pecuniary reverses in 1837, he took charge of the Locks and Canal Co. of Lowell, and afterwards was agent of the Great Falls Co. at Somersworth, N. H. He took a deep interest in the moral and intellectual improvement of his operatives.

JACKSON, SAMUEL, 1787-1872; b. Philadelphia; was a distinguished physician, lecturer and writer. He was professor of the institutes of medicine, 1835-63, in the university of Pennsylvania. His most important work is the *Principles of Medicine*, 1832. He published also *Discourse commemorative of Nathaniel Chapman*, 1854; introduction to Morris's translation of *Lehman's Chemical Physiology*, 1856; *Occasional Essays*, 1872.

JACKSON, THOMAS, D.D., 1579-1640; b. England; graduated at Oxford, 1595; was president of Corpus Christi college in 1630, prebendary of Winchester in 1635, and dean of Peterborough in 1638. He was one of the most learned men of the 17th c. in theology, metaphysics, languages, the arts and sciences. He published a commentary on the apostles' creed, sermons and theological treatises. His complete works in 12 vols. were republished at Oxford in 1844. His writings are distinguished for elegance and dignity of style. Southey ranks him among the best of English divines.

JACKSON, THOMAS, D.D., 1783-1873; b. England; was for 20 years an itinerant Wesleyan preacher, and after editing the Wesleyan magazine by appointment of the conference for 19 years, became tutor in the Richmond Wesleyan theological institution. Of his numerous published works the most important are *The Institutions of Christianity*, 3 vols.; *The Centenary of Methodism*; *Life of Charles Wesley, and Contemporary Events*, 2 vols., 1841; *Providence of God Viewed in the Light of Scripture*, 1862; *Curiosities of Pulpit Literature*, 1868.

JACKSON, THOMAS JONATHAN, an American confederate gen., better known as "Stonewall Jackson," was b. in Virginia in 1824. In 1842 he entered the military academy at West Point as a cadet, and was brevetted second lieut. in the 1st corps of U. S. artillery in 1846. He was attached to Magruder's battery in the Mexican war, and was brevetted capt. for his gallant conduct in the battles of Contreras and Churubusco. He retired from the army in 1852, and became professor of mathematics and military science in the university of Virginia. At the outbreak of the war of secession he was appointed a brig. gen. in the confederate army. His *nom de guerre* of "Stonewall" was occasioned by the firmness of his brigade at the battle of Bull run, July 21, 1861. He defeated the northern forces at Ball's bluff, and outgeneraled and defeated the federal commanders in the Virginia campaign of 1862, after which he led the invasion of Maryland, and captured Harper's Ferry. He died of wounds received from his own men at Chancellorville, May 9, 1863.

JACKSON, THOMAS JONATHAN (*ante*), 1824-63; b. at Clarksburg, Va., the third of four children of Jonathan Jackson, a lawyer, and his wife Julia Neale. The father died when Thomas was but three years old, and the mother, with three children, was left without means of support. She taught school and worked at sewing. After three years of widowhood she married a lawyer named Woodson. He was poor, and the children were parceled out among their uncles and aunts. Fourteen months after her second marriage Mrs. Woodson died. Thomas went to live with Cummins Jackson, an uncle, who acted the part of a father to him, and there the boy grew up to the age required for entrance to the national military academy, to which he was appointed in 1842. His appearance when he entered the academy is thus described: "A slender lad, who walked rapidly, with his head bent forward; a grave, thoughtful face, which gave him a dull look; but when any thing interested or excited him his form became erect, his eyes flashed like steel, and his smile—as sweet as a woman's—would illumine his whole face." He graduated June 30, 1846, with the usual rank of second lieutenant of artillery; the Mexican war had just commenced, and all the West Point graduates were ordered into active service, arriving before Vera Cruz, Mar. 9, 1847. After a siege of 20 days that city surrendered, and the little army under gen. Scott moved on towards the Mexican capital, defeating Santa Anna, at Gerro Gordo, and winning other victories at Contreras and Churubusco. At the latter place Jackson made his first military mark. The first lieut., then commanding a battery, was killed and Jackson took his place, behaving so gallantly that he was given the rank of brevet captain. After Churubusco gen. Scott defeated the enemy at Molino del Rey, and finally took the castle of Chapultepec, which was the last defense of the city of Mexico. In the assault on the castle Jackson showed the greatest courage and daring, for which he was warmly complimented by his superior officers. Soon after the capture of the city, Sept. 14, 1847, which put an end to the war, Jackson, now a major, was sent with his command to fort Hamilton, New York harbor, where he remained two years. Here he became absorbed in reflections upon religion, was baptized, and became an attendant of the Protestant Episcopal church. From fort Hamilton he was sent to fort Meade, near Tampa bay, Florida. Not long afterwards he was chosen professor of natural philosophy and artillery tactics in the Virginia military institute at Lexington. He resigned from the army in July, 1851, and accepted the professorship. A few months after settling at Lexington he joined the Presbyterian church, and took an active part in the usual religious work. Aug. 4, 1853, Jackson married Miss

Eleanor Junkin, who lived only 14 months—just as long as his mother lived after her second marriage. In the summer of 1856 he traveled in England and on the continent. July 15, 1857, he married Mary Ann Morrison, daughter of Dr. Robert Morrison, a Presbyterian clergyman of North Carolina, and the pair settled down to a quiet life near Lexington, but soon to be disturbed by the coming rebellion. Jackson went with his state, and on April 22, 1861, became once more a soldier, joining the army of the rebellion under gen. Robert E. Lee at Richmond. He was made a colonel and put in command at Harper's Ferry, which place became the rendezvous for all the troops in the valley of Virginia. Jackson was soon superseded at Harper's Ferry by gen. Joseph E. Johnston, and was put in command of five regiments of Virginia volunteers, forming the body afterwards known as the "Stonewall Brigade." The first work of importance done by Jackson in the war of the rebellion was the destruction of the works, locomotives, and cars of the Baltimore and Ohio railroad at Martinsburg; and on this performance he wrote the following noticeable comment: "It was a sad work; but I had my orders, and my duty was to obey. If the cost of the property could have been expended in disseminating the gospel of the Prince of Peace, how much good might have been expected!" Jackson had a skirmish at Haines's farm, where he had two men killed and ten wounded, and then he fell back to join the main body of the confederates near Winchester. July 3, 1861, he was made a brigadier-general. In the battle of Bull Run Jackson had an active though not prominent part; prominent enough, however to secure his well-known *sobriquet* of "Stonewall," which came from a remark of gen. Bee, whom Jackson was supporting. Bee was in active engagement, and to encourage his men he pointed to his support ranged on a ridge near by and cried out: "There is Jackson standing like a stone wall; rally behind the Virginians." A moment later gen. Bee was killed. Immediately afterwards Jackson's force was engaged, whereupon he ordered, "Reserve your fire till they come within fifty yards; then fire and give them the bayonet; and when you charge, yell like furies." This is said to have been the origin of the afterwards well-known "rebel yell." After the Bull Run battle Jackson fell back beyond Centerville, and began to drill his troops; and, Oct. 7, 1861, he was raised to major-general, taking command under gen. Johnston. Early in 1862 Jackson had the principal command in the Shenandoah valley, and by the secrecy and swiftness of his many sudden attacks he gave the union commanders much trouble, especially in the daring raids made by col. Ashby's cavalry. Jan. 31, 1862, Jackson suddenly resigned in consequence of difficulties or jealousies with gen. Loring, but he was prevailed upon to withdraw his letter. When the series of engagements known as the "Seven days' battles" began, Jackson resumed active service under Lee, and with his command was prominent in the conflict at Cold Harbor, June 27, 1862, and at Malvern Hill four days afterwards. On Aug. 9 his command, having been ordered northward, engaged in the indecisive battle at Cedar mountain. Soon after this event Jackson's powers were enlarged, and he was given the command of almost the half of the confederate army of Virginia, being second in authority only to gen. Lee. Aug. 29 he was in command at the second Bull Run battle. Two weeks afterwards, by a wonderfully rapid movement, he captured nearly 11,000 union soldiers at Harper's Ferry; instantly ordered a forced march, and the second day afterwards arrived at Antietam in time to participate in the conflict at that place. His next active service was at the battle of Fredericksburg, Dec. 13, 1862, where his behavior secured for him the rank of lieut. general. A period of comparative rest followed until May 2, 1863, when with about two-thirds of the confederate army he marched rapidly 15 miles to near Chancellorsville, and by a surprise turned the right of the union army, driving it back upon the main body. Jackson supposed the fighting to be over, and that he had won an important victory; but with an escort of a few men rode into a forest to make observations. He had ridden some distance beyond the pickets, when one of the party remarked that he ought not thus to expose himself, but he replied, "There is no danger; the enemy is routed." He soon became aware that he was near the union lines, and the party rode back towards their own forces. They were mistaken for union cavalry, and were fired upon by their own men; some were killed, some wounded, but for the moment Jackson escaped. He turned into a thicket and rode towards his lines, when his own men fired again, and he received three shots, one in the hand and two in the arm, one of the latter breaking the bone and cutting the artery two inches below the shoulder. After riding a short distance he was assisted from his horse and through the battle, which had recommenced on the part of the unionists and was raging furiously, he was with great difficulty removed to a safe place. The arm was taken off, but he was attacked with pneumonia and died on Sunday, ten days after receiving the wound. Jackson was a muscular man, fully six ft. high, with a clear or pale complexion, bluish-gray eyes, an aquiline nose, prominent chin, strong jaws, and a large skull, with high forehead. He was a man of intense convictions, of deep moral earnestness, and of exceeding vigor and promptness in action. A bronze statue of him was dedicated at Richmond, Va., in Oct. 1875.

JACKSON, WILLIAM; 1730-1803; a distinguished English musician; was liberally educated, and showing a strong taste for music, was placed by his father under the care of the organist of Exeter cathedral. At the end of two years he went to London, studied

under John Travers, organist of king's chapel; returned to Exeter, became a teacher and composer, and in 1777 organist and master of the choristers of the cathedral. His songs, canzonets, and trios rank high in England. His *Six elegies for three voices* Dr. Burnet considered the best of his works. He published in 1782 *Thirty Letters on Various Subjects*, and in 1798 *The Four Ages, together with Essays on Various Subjects*. He was also a landscape painter.

JACKSONVILLE, the co. seat of Duval co., Florida, on the w. bank of the St. John's river, 20 m. from its mouth, at the e. terminus of the Jacksonville, Pensacola, and Mobile railroad, 165 m. e. of Tallahassee, and 155 m. s.w. of Savannah; pop. '74, 12,000. The streets cross each other at right angles. The city has 14 churches, 2 national banks, the Stanton institute, a high school, public and private schools, a Roman Catholic academy for girls, a hospital, 5 newspapers, and manufactories for lumber, moss, marmalade, and machinery. Its commerce is considerable. The exports are lumber, cotton, naval stores, sugar, fruits, fish, and vegetables. Steamers run semi-weekly to Savannah and Charleston, and river steamers daily to St. Augustine and Palatka. A bluff on the n.w. commanding a fine view of the city has some elegant residences.

JACKSONVILLE, a city and co. seat of Morgan co., Illinois; 34 m. s.w. of Springfield, 200 m. s.w. of Chicago, 90 m. n. of St. Louis; pop. '80, 11,009. It is at the junction of the Chicago and Alton with the Wabash railroad, and is the s. terminus of the Peoria, Pekin, and Jacksonville railroad. From this city the Jacksonville, North-western, and South-eastern railroad extends to Virden. This city contains 24 churches, 2 national and 2 private banks, a savings bank, 3 hotels, 4 newspapers, a free reading-room, a free library of 1600 vols., and a conservatory of music. It is distinguished for its educational and benevolent institutions. It contains Illinois college (Congregational), Illinois college for women (Methodist), Jacksonville academy for girls, a ladies' atheneum, a business college, a high school, and several graded schools. Here are the state institutions for the blind, insane, deaf-mutes, and idiotic. The Lutherans also have an orphan asylum and a retreat for the insane. The city has a woolen mill, a car shop, a foundry, soap factories, planing and flouring mills. The streets are wide and adorned with shade trees, and the city is provided with gas, water-works, and sewerage.

JACK TREE, *Artocarpus integrifolia*, a native of the East Indies, now spread over most of the tropics. It is nearly allied to the bread-fruit and bears a fruit resembling that of that tree, though much larger. It is used as food in India, but has a disagreeable flavor. Its wood is of excellent character, and is much used for carving, scroll-work, and various fancy articles.

JACME, or JAYME, EN, I.; 1207-1276; b. Montpellier, France; was king of Aragon, and count of Barcelona. He is often called the conqueror from his having conquered the Moorish kingdoms of Majorca, Valencia and Murcia, and imposed tribute on some others. The title *en* is supposed to be of the same import as the modern *don*. An ancient account of his life and exploits appeared in a Castilian translation at Barcelona in 1848, but its authenticity is not fully established.

JACMEL, or JACQUEMEL, a sea-port t. on the s. coast of Hayti, on a bay of the same name, 30 m. s.w. of Port-au-Prince; pop. 6,000. Many of the streets are very narrow, and the houses mostly of wood. It has a commodious harbor for the largest vessels, but it is exposed to the s. winds and the heavy sea. It has a considerable trade with the United States, and the West India mail steamers stop here. The climate is hot and unhealthful.

JACOB (Heb. *Yaakob*, derived variously from "heel," Gen. xxv. 26, or from "to deceive," Gen. xxvii. 36), one of the three chief Hebrew patriarchs. He was the second son of Isaac and Rebekah, and on account of his docile, domestic character was the favorite of his mother. His conduct towards his brother in regard to the birthright (Gen. xxvii.) does not greatly redound to his credit. After an exile of 21 years in Padan-aram, whither he had fled to escape the vengeance of Esau, he returned to Canaan with two wives (Rachel and Leah), two concubines (Bilhah and Zilpah), 12 sons (the fathers of the subsequent Hebrew tribes), and a daughter named Dinah, who was the unintentional cause of a vindictive massacre of the Shechemites by her brothers Simeon and Levi. In his 130th year he and his family went down to Egypt, where his favorite son Joseph had become a great man under Pharaoh. Here he lived for 17 years longer in the land of Goshen, and died in his 147th year. His body was embalmed, carried back to Canaan with great pomp by his sons, and there buried near Hebron. Mention is frequently made of Jacob both in the Old and New Testaments, and there are also many legends about him in rabbinical and patristic, as well as in the Mohammedan literature.

JACOB (*ante*), as to his natural character, was significantly named "a supplanter." In his bargain with Esau he was unbrotherly and selfish in that, instead of gladly succoring his famished brother, he set a price on the nourishment which he had ready at hand, and that price extortionate—the birthright for a morsel of meat. He was guilty also in consenting to his mother's device for deceiving his father. Even his temporary opposition to it was not made on the right ground. Instead of refusing to do what was proposed because it was wrong, he objected to doing it only through fear of discovery, say-

ing not, "I shall be a deceiver," but, "peradventure I shall seem to be." His execution of the plan involved him in many falsehoods. He said to his father, "I am Esau," though he was not; "I have done as thou badest me," though his father had not bidden him do anything, and he had not done what he said he had. He falsely claimed the help of God in what he said he had done. He aggravated the deception in adhering to it by presenting the skin of a kid as his own skin, and giving counterfeit venison as the true. He consummated the fraud by repeating to his still doubting father the declaration, "I am Esau," and by taking the blessing from him as if he were the older son. His subsequent dealings with Laban also were marred by crafty selfishness, even though he supposed himself driven to it in contending against equal selfishness on Laban's part.

The providential discipline by which Jacob's character was transformed was painful, varied, long continued, and quite in the line of his sins. His brother's anger compelled him to flee from his father's house; the exile which his mother hoped would continue only a few days was prolonged to 20 years; and when at length he was returning home, fear of his brother again filled him with distress. Having imposed himself on his father as the older son, he had an older daughter imposed on him for a wife instead of the younger whom he loved. Having been extortionate in his dealings with his brother and regardless of his exhaustion by the toils of the chase, he found his own wages changed ten times during a course of toil in which, as he said, by day the drought consumed him and the frost by night; and his sleep departed from his eyes. He was greatly afflicted by Rachel's death, was dishonored by the misconduct of his children, and endured years of anguish because of the absence and supposed death of his best-beloved son. During this course of discipline the care of God over him was manifested by the vision at Bethel when he went out from home, by the mysterious wrestling with him at the brook Jabbok on his return, and by the promise to be with him in the final journey of his life down into Egypt to see his long-lost son. After the darkness which had obscured so much of his career, caused chiefly by his persistent efforts to work out his promised destiny for himself, at evening-time with him it was light. The 17 years spent by him in the land of Goshen seem to have been irradiated with the graces of a humble and devout spirit, with an honored old age, and a prophetic insight into the glories of the future for mankind, his children, and himself. Having been chastened in the world, he was not finally condemned with the world. With all his disadvantages of nature and faults of character, rendering him far less attractive socially than his impulsive, careless, generous brother, he had a nature more capable of development on the spiritual side, less controlled by appetite and by the present things of the senses, therefore more capable of being schooled into faith, and of being brought through painful discipline into a true manhood at last.

JACOB, LE BIBLIOPHILE. See LACROIX, PAUL.

JACOBÆAN LILY (AMARYLLIS FORMOSISSIMA). See AMARYLLIS, *ante*.

JACOB OF EDESSA, d. 708; an eminent Syrian theologian and writer who lived in the last half of the 7th century. In early life he entered the monastic order. He was appointed bishop of Edessa about A.D. 651, but resigning his office, he retired to a monastery in Toledo. Here he applied himself to the study of the Syriac version of the Old Testament, making many annotations, some of which are extant. He had a thorough knowledge of Hebrew, Syriac and Greek; and for his able translation of Syriac works into Greek he received the surname of *interpreter of the books*.

JACOB OF HUNGARY, named THE MASTER, was a religious fanatic in France during the 7th crusade, which in 1244 was headed by Louis IX, or St. Louis. St. Louis having been captured by the Mussulmans of Egypt, Jacob proclaimed through France a crusade for the liberation of the king. With 30,000 shepherds and peasants collected in Flanders, increased at Amilus to 100,000, he entered Paris, his followers committing outrages, killing the monks, and Jacob performing the rites of priest in the church of St. Eustache. Jacob having been killed by order of the queen, his followers were scattered.

JACOBI, ABRAHAM, b. Westphalia, 1830; graduated at the university of Bonn in 1851, and removed to the United States in 1853. He was professor of obstetrics and diseases of women at the New York medical college 1860-69, and afterwards at the college of physicians and surgeons. He published *Dentition and its Derangements*, and was editor of the *American Journal of Obstetrics and Diseases of Women and Children*. In this branch of medical science he has attained eminence; and recently he has published a volume on diphtheria, valuable as embodying the results of extensive and careful observation.

JACOBI, FRIEDRICH HEINRICH, a German philosopher, b. at Düsseldorf, Jan. 25, 1743. He was educated at Frankfort, whence he proceeded to Geneva with a view to preparing himself for a mercantile career. In 1770 he was appointed councilor of finance for the duchies of Berg and Jülich, and having married a lady of fortune, was enabled to devote himself to literary pursuits. In 1804 he removed to Munich, where he had been appointed a member of the newly-instituted academy of sciences, of which he became president in 1807. He died on Mar. 10, 1819. His writings consist partly of romances, and partly of philosophical treatises. The principal are *Woldemar* (2 vols. Flensb. 1779), *Eduard Allwill's Briefsammlung* (Bresl. 1781), both philosophical romances;

Ueber die Lehre des Spinoza in Briefen an Mendelssohn (Bresl. 1785), a polemic against logical methods of speculation in the search after the higher class of moral truths; and *David Hume über den Glauben, oder Idealismus und Realismus*, in which the same polemic is continued, but in which an attempt is also made to demonstrate that the mind or nature of man possesses another faculty—viz., faith, or moral intuition, by which the higher truths are as firmly grasped as, by faith in the perceptions of the senses we, so to speak, lay hold on the phenomena of the material world. Herein lies the difference between Kant (and indeed the whole school of German idealists) and Jacobi; the former appears to admit only the “subjective” reality of such conceptions as God, the soul, immortality, etc.; the latter claims for them an “objective” reality. Kant denies that the “faculty of faith” gives us “knowledge,” in the strict sense of the word; Jacobi affirms that it does. One of his treatises, *Von den göttlichen Dingen und ihrer Offenbarung* (Leip. 1811), was the occasion of a rather sharp controversy between him and Schelling. Jacobi is not a systematic thinker, and did not form a school. He is, as might be expected, deficient in the qualities he despised—method and logical sequence; but his style is remarkably good, possessing both warmth and clearness. It has been compared by his countrymen to that of Plato. His collected works appeared at Leipsic (6 vols. 1812-24).

JACOBI, KARL GUSTAV JACOB, a celebrated mathematician, was b. at Potsdam, in Prussia, Dec. 10, 1804; studied at the university of Berlin, where he made great progress in philosophy, philology, and mathematics; and in 1829 became a professor at Königsberg. In 1829 he published his celebrated work, *Fundamenta nova Theoriae Functionum Ellipticorum*, for which he received the great medal of the academy of sciences of Paris; the work, however, only contains a portion of his researches on the subject of elliptic functions. In the same year he made a tour through northern Germany and France, forming the acquaintance of Gauss, Legendre, Fourier, Poisson, and other celebrated geometers. In 1842 he took a second journey, in company with his wife, to visit England and Scotland and attend the meeting of the British association. Soon after his return home his health broke down, and he started for Italy. On his return he was removed from Königsberg to Berlin, where he died of small-pox, Feb. 18, 1851. Beside the work above mentioned, Jacobi wrote a great number of memoirs on the different branches of the higher mathematics, chiefly series and definite integrals, and was a regular contributor to the celebrated *Journal für reine und angewandte Mathematik* of Crelle.

JACOBI, MARY PUTNAM, M.D.; b. London, 1842; daughter of George Putnam; since 1873 wife of Abraham Jacobi, M.D. Coming to New York in 1848 she was educated at the Twelfth street grammar school; then in the woman’s medical college in Philadelphia; and graduated from the college of pharmacy in New York. In 1868 she went to Paris, and was the first woman admitted to the *école de médecine*, from which she graduated in 1871, receiving the second prize, a bronze medal. Returning to New York, she commenced the practice of medicine, and was appointed professor of materia medica in the medical college established by Elizabeth Blackwell, M.D., which position she now holds. She has published many papers in the *Medical Record* and the *Journal of Obstetrics*; and recently, in connection with V. A. White, M.D., has published *Cold Pack and Massage in the Treatment of Anæmia*.

JACOBI, MAXIMILIAN, 1775-1858; a German physician, b. in Düsseldorf. After studying at Jena, Göttingen, Edinburgh, and Erfurt, he became assistant in a London hospital, and subsequently director of a lunatic asylum at Sulzburg. He favored non-restraint for the insane. In 1820 he took charge of the insane asylum at Siegburg. At a festival held in 1857 to commemorate the 50th anniversary of his doctorate, were present distinguished men from Germany, France, and England.

JACOBI, MORITZ HERMANN, 1801-74; a brother of Karl Gustav Jakob; b. Potsdam; was professor of civil engineering at the university of Dorpat in 1835; a member of the St. Petersburg academy of sciences in 1847. He distinguished himself by his researches in physics while in Russia. In 1832 he constructed an electric telegraph 18 m. in length between two of the palaces, and discovered by his experiments that the earth could be used to complete the electrical circuit. In 1837, simultaneously with Spencer of England, he invented the process of electrotyping. He contributed treatises on the applications of electro-magnetism to the academy of St. Petersburg.

JACOBIN, the name by which members of the Dominican order were popularly known in France. The name originated from the fact that their mother-establishment was situated in the *Rue St. Jacques*, in Paris; and it was thence extended to the entire order throughout France.

JACOBINS, the members of a political club which exercised a very great influence during the French revolution. It was originally called the *Club Breton*, and was formed at Versailles, when the states-general assembled there in 1789. It then consisted exclusively of members of the states-general, all more or less liberal or revolutionary, but of very different shades of opinion. On the removal of the court and national assembly to Paris, this club began to acquire importance. It now met in a hall of the former Jacobin convent in Paris, whence it received the name of the Jacobin club, which was

first given to it by its enemies; the name which it adopted being that of the *Society of Friends of the Constitution*. It now also admitted members who were not members of the national assembly, and held regular and public sittings. It exercised a great influence over the agitation, of which the chief seat and focus was in the capital, and this influence was extended over the whole country by affiliated societies. Its power increased until it became greater than that of the national assembly. It formed branch societies or clubs throughout France, of which there were soon not less than 1200. When the national assembly dissolved itself in Sept., 1791, the election of the legislative assembly was mainly accomplished under the influence of the Jacobin club. Almost all the great events which followed in rapid succession were determined by the voice of the club, whose deliberations were regarded with more interest than those of the legislative assembly. It reached the zenith of its power when the national convention met in Sept., 1792. The agitation for the death of the king, the storm which destroyed the Giroudists, the excitement of the lowest classes against the *bourgeoisie* or middle classes, and the reign of terror over all France, were the work of the Jacobins. But the overthrow of Robespierre on the 9th Thermidor, 1794, gave also the deathblow to the Jacobin club. The magic of its name was destroyed; and the Jacobins sought in vain to contend against a reaction which increased daily both in the convention and among the people. A law of Oct. 16 forbade the affiliation of clubs, and on Nov. 9, 1794, the Jacobin club was finally closed. Its place of meeting was soon after demolished.—The term Jacobins is often employed to designate persons of extreme revolutionary sentiments.

JAC'OBITES, in church history, is the common name of the oriental sect of Monophysites (q.v.), but it belongs more specially to the Monophysites of Syria, Mesopotamia, and Chaldea. The name is derived from a Syrian monk called Jacobus Baradceus (Bar-dai), who in the reign of Justinian formed the Monophysite recusants of his country into a single party. The Jacobites at present number about 40,000 families, and are subject to two patriarchs, appointed by the sultan—one resident at Diarbekir, with the title of patriarch of Antioch; the other at Saphran, under the style of patriarch of Jerusalem.

JAC'OBITES (from *Jacobus*, the Latin form of James), the name given to the adherents of the male line of the house of Stuart in Great Britain and Ireland after the revolution of 1688. Many of the most devoted royalists followed James II. into France; but the greater part of the Jacobites remaining in their native land made a greater or less show of submission to the new government, whilst they secretly supported the cause of the Pretender. Their intrigues and conspiracies were incessant till the middle of the 18th century. Their hostility to the house of Hanover broke out in rebellions in 1715 and 1745, in consequence of which not a few of them lost their lives upon the scaffold, titles were attainted, and estates confiscated. After 1745 their cause became so obviously hopeless that their activity in a great measure ceased; and it was not long till it ceased altogether, and those who still retained their attachment to the exiled family acquiesced in the order of things established by the revolution. In Scotland, the hopes and wishes of the Jacobite party were expressed in many spirited songs, which form an interesting part of the national literature. See the *Culloden Papers* (Lond. 1815); Hogg's *Jacobite Relics* (2 vols. Edin. 1819); and Chambers's *Jacobite Memoirs* (Edin. 1824).—The Jacobites of England were also called *Tories*. They were generally distinguished by warm attachment to the church of England, as opposed to all dissent, if they were not members of the church of Rome, and held very strongly the doctrine of *non-resistance*, or the duty of absolute submission to the king. The Jacobites of Scotland were also generally *Episcopalians* and Roman Catholics. Macaulay, however, points out that the Highland clans which espoused the Jacobite cause did so on other grounds than the English Jacobites, and were far from having previously received the doctrine of non-resistance. In Ireland, the Jacobite cause was that also of the Celts as opposed to the Saxons, or the native race against the English colonists, and of the Roman Catholics against the Protestants. These diversities prevented a complete union, and greatly weakened the Jacobites.—See *History of the Rebellion in 1745*, by R. Chambers.

JACOBS, PAUL EMIL, 1802–66; b. Gotha; a German painter; studied at Munich and Rome; resided in St. Petersburg, 1830–34. Returning to Gotha in 1840 he became court-painter to the grand duke, and died in his native city. His "Adam and Eve," "The Flight into the Wilderness," "Judith and Holofernes," "Samson and Delilah," were very popular, the last two receiving prizes in Philadelphia in 1850.

JACOB'S LADDER, on shipboard, is a short rope-ladder with wooden steps, to give easy access to the shrouds and tops.—It is also the name of an apparatus for raising light weights a considerable height. One form, much used in breweries and distilleries, is an endless revolving chain of buckets, filling themselves at the bottom of the chain, and emptying themselves at the top.

JACOB'S LADDER, *Polemonium caeruleum*, a herbaceous perennial plant of the natural order *polemoniaceæ*, a rare native of Britain, but more common in the center and s. of Europe, found also in the temperate parts of Asia and of North America. It is com-

mon in flower-gardens in Britain. It has pinnate leaves, with ovato-lanceolate leaflets, a smooth stem 1 to $2\frac{1}{2}$ ft. high, and a terminal raceme of bright blue (sometimes white) flowers, with wheel-shaped 5-lobed corolla. Great medicinal virtues were once ascribed to it, but the only quality which it seems to possess is a slight astringency.

JACOBSON, WILLIAM, D.D.; b. England, 1803; graduated at Oxford in 1827; was vice-president of Magdalen hall, 1832-48; and then appointed regius professor of divinity. In 1865 he became bishop of Chester. He edited *Remains of the Apostolic Fathers*, 2 vols.; Nowell's *Catechism*; and the *Collected Works of Bishop Sanderson*, 6 vols.; and published two volumes of sermons.

JACOB OF VITRY; d. 1240; b. Vitry, France, in the last half of the 12th century. Attracted while a presbyter at Argenteuil by the sanctity of Maria of Ognies, he became her devoted disciple. At the request of the pope he preached against the Albigenses, and, finally enlisting in the enterprise of liberating the holy sepulcher, he went through France to levy contributions. He was made bishop of Acre in 1217 by Honorius III., and at his request went to the Holy Land. Here he baptized the children of the Saracens which the Christians had taken, and intrusted them to the care of pious women. Resigning that see in 1225 he returned to Ognies, and was made by pope Gregory IX. cardinal and papal legate of France, Brabant, and the Holy Land. His work *Historia Orientalis*, or *History of Jerusalem*, is valuable. He published also *Life of St. Mary of Ognies*, sermons on the gospels and epistles, and several letters. He was an eloquent preacher.

JACOBY, JOHANN, b. 1805; a German physician; practiced in Berlin and Heidelberg. His political opinions made him notorious, and he was arrested four times upon suspicion, being accused of high treason. For his pamphlets, *Vier Fragen* and *Das Königliche Wort Friedrich Wilhelm III.*, he was pardoned; but for some later publications of his opinions he was imprisoned.

JACOBY, LUDWIG SIGISMUND, D.D.; b. Mecklenburg, 1811; was of Jewish parentage, but became converted to Christianity in early manhood. He came to America and entered the Methodist church as a preacher, 1849. He was active in establishing missions in both this country and Europe, and founded a theological college at Bremen. Returning to America in 1872, he became a pastor in St. Louis, Mo.

JACOTOT, JEAN JOSEPH, the inventor of the "universal method" of education, was b. at Dijon, in France, in 1770. He served for some time in the army, but in 1790 was appointed by Napoleon first to the chair of mathematics in the normal school, afterwards secretary to the minister at war, and a director of the polytechnic. He retired to Belgium in 1815, where he was appointed lecturer on French literature in the university of Louvain, and afterwards director of the military normal school. He returned to Paris in 1838, and died there July 30, 1840. His system, propounded in general rules, which, however, without his own explanation, would have been quite unintelligible, appears to consist in directing the student's exertions to particular subjects, encouraging and inciting him in every possible manner to make use of his mental powers, and there leaving him; the teacher is on no account to become an expounder, but after setting the student on the right track, is to leave him to explain away his own difficulties. Jacotot's method very much resembled that of Hamilton (see HAMILTONIAN SYSTEM), and, like it, was crude and one-sided. The valuable elements of it have been incorporated in the more rational and catholic methods of recent times. The wonderful results said to have been produced by Jacotot are, so far as real, to be attributed to the exceptional zeal and energy that always characterize the apostle of a new system, as much as to the system itself.

JACOVA, or YAKOVA, a t. of European Turkey, Albania, in the pashalic of Scutari, on the White Drin, 20 m. n.w. of Prisrend. Pop. 18,000.

JACQUARD' LOOM, a loom fitted with the Jacquard apparatus for the purpose of pattern-weaving. This apparatus was the invention of M. Joseph Marie Jacquard, an ingenious Frenchman, a native of Lyons, who, being necessitated to carry on the weaving business of his father, for which he had a distaste, and, according to some accounts, still further stimulated by reading an account in an English newspaper of the offer of a premium for any person who should invent a machine for weaving nets, set his wits to work to improve the existing machinery for weaving. By his invention he enabled an ordinary workman, with comparative ease, to produce the most beautiful patterns in a style which had only previously been accomplished with almost incredible patience, skill, and labor. Nevertheless, the reception of his great invention by the public was most dispiriting, for although rewarded with a small pension by Napoleon, the silk-weavers themselves offered such violent opposition to its introduction that on one occasion he narrowly escaped with his life, and his machine was broken up by the body of men who, under the title of the conseil des prud'hommes, were appointed to watch over the interests of the Lyonnese traders, and it was destroyed in the public square of Lyons. To use Jacquard's own language: "The iron was sold for iron, the wood for wood, and he himself was delivered over to universal ignominy;" nevertheless, on that same spot where the machine was publicly destroyed, a statue now stands, to show the gratitude of a more enlightened generation.

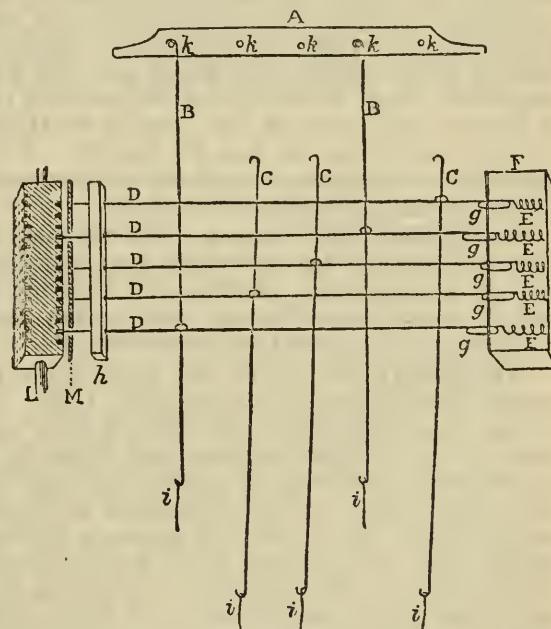

Even after the partial adoption of his machine, which was patented, Jacquard had numberless annoyances to contend with; the workmen, as usual, opposed ignorant prejudice to its progress, and their masters, little better, took it up so lukewarmly that it failed in many instances, and actions were entered against the patentee for injury done to material, etc. The value of the invention was, however, too great to admit of its being long suppressed, and when its value was once fairly recognized, it effected a complete revolution in the art of weaving, especially in the finer kinds of figured silk fabrics.

The Jacquard apparatus can be adjusted to almost every kind of loom, its office being merely to direct those movements of the warp threads which are required to produce the pattern, and which previously were effected by the weaver's fingers; its arrangements generally are very complicated, but its principles are remarkable for their extreme simplicity and certainty.

In ordinary weaving the alternate threads of the warp, or longitudinal arrangement, are raised so as to enable the weaver to throw the shuttle containing the weft thread transversely across from his right to his left hand between the warp threads so raised and those left at rest. When the weft is so passed through, the raised warp threads are lowered, and the other set raised, the shuttle being then passed through from left to right. This is the most simple idea of plaiting or weaving. If, however, a pattern has to be produced either in plain materials or varied colors, it is necessary, instead of raising and depressing the whole threads of the warp, in two sets, as above described, to raise only such as are required to develop the various parts of the figure, and this, of course, must be done with great exactness, as the position of every thread tells upon the formation of the pattern. The apparatus of Jacquard is for the purpose of regulating these movements, and its mode of action is as follows:

The warp threads are each (as in the common weaving process) passed through a small loop in the lifting thread, so as to be raised by means of the treadles, which act directly upon the lifting bars; these lifting threads (*i*, *i*, *i*, *i*, *i*) are attached to certain wires in the Jacquard apparatus, which form a rigid continuation ending in a hook, which, when nothing interferes, is caught and raised by each upward motion of the lifting bar; thus, A is the lifting bar, and it has five projections (*k*, *k*, *k*, *k*, *k*), upon which the hooks of the wires catch when in a straight position, as at B, B, but which miss them if they be thrown out of the perpendicular, as at C, C, C. There are only five of these wires given, to prevent confusion, but practically there must be one for every thread of the warp—that is, one for every thread in the width of the cloth to be woven. Each of the lifting wires passes through a horizontal needle placed at right angles, D, D, D, D, D, which has a loop formed for the purpose. This needle passes freely through an opening in the frame at h, and is so looped on to another rod, g, on the spring-box F, that it moves freely without fear of displacement, and if pushed back into the spring-box, is made to press upon one of the spiral springs, E, which restores it to its place as soon as it is freed from pressure. In the diagram, this pressure is supposed to be exerted upon three of the lifting wires, C, C, C; consequently, if the lifting bar A is simultaneously raised, those three wires are missed, whilst the other two, B, B, being in position, catch the projections *k*, *k*, on the bar, are drawn up with it, and thus raise the threads of the warp to which they are attached.

Now, the regulation of this pressure upon the horizontal needles is effected by a revolving square roller, which has each of its four sides perforated with rows of holes, which, like the needles and lifting wires, correspond in number to the threads of the warp. This roller, when in its place, receives into one row of perforations the whole row of needles where they project through the frame at h, and it has a motion given by the machinery which brings each row on its four surfaces in regular order into the same position, and if no impediment is offered, all the needles are undisturbed, and the upright wires lift the entire set of warp threads to which they are attached. But in order to produce the necessary variations of motion required by the pattern, a set of cards are made, each of the width of the square roller; these also are so perforated that when placed on the surface of the roller their perforations correspond exactly with those on the roller immediately beneath them; but the cards are perforated in exact accordance with the pattern, so that intervals occur in which there are no perforations to correspond with those on the roller; hence, when the roller L is brought up to the frame h, some of

the needles will find entrance into the holes of the roller through the corresponding perforations in the covering card, seen in section M; but others will be prevented entering by the absence of such perforations, and the card, by the resistance it offers, will force the needles thus opposed back upon the springs E, E, E, removing thereby the hooks of the lifting wires from the action of the lifting bar. The cards are looped together at the corners, and move as an endless chain on the rollers, and the entire set of perforations on the whole chain of cards exactly represents the pattern to be produced; the same as the notes represent the air in a piece of music. Of course, the simple operations here described require mechanical arrangements of great nicety to regulate them, and these are so complicated that mere verbal description would hardly help much to explain them; indeed, even with the loom and its apparatus, and its cumbrous arrangement of hundreds, and even thousands of cards, before us, the unpracticed eye finds great difficulty in comprehending its movements.

A very wonderful simplification of the Jacquard apparatus was shown in the international exhibition (1862), by Eugenio Vincenzi of Modena, by which a saving of bulk alone is effected to the extent of two-thirds, and the toil of the artisan is lessened greatly by the corresponding lightness of the parts of the machine which he has to move. The most remarkable part of this new invention is the extreme delicacy of the needle action, so that there is no shock when the card offers resistance; hence the inventor has been enabled to substitute paper for thick card-board, and can consequently perforate a dozen with the same ease as one; hence the pattern may be repeated without extra labor. This beautiful little loom will certainly displace the ordinary Jacquard, if it is not itself superseded by the wonderful invention of the electric loom by Bonelli, for a description of which see ELECTRIC LOOM.

JACQUELINE OF BAVARIA; 1400-36; a Bavarian princess whose wealth made her a prize to be roughly contended for by contemporary princes. She was the only daughter of William VI. of Bavaria, and as a child was promised in marriage to prince John of France, but his early death, 1417, left her choice free. She rejected many suitors, amongst others the duke of Bedford, brother of the English king, and married John of Brabant. Tiring of him, she left him and went to England, where the duke of Gloucester obtained a papal dispensation to marry her, declaring her first marriage void. As soon as she was his wife he set out with 5,000 men to obtain possession of her estates, which had been seized by the neighboring princes; but Jacqueline was taken prisoner at Ghent, and having at last escaped to Holland, declared herself free of her marriage tie, and carried on the war for herself. Partially succeeding, she gave up her rights as heiress of Bavaria to the duke of Burgundy, in ransom of the third husband whom she had chosen, Francis of Borselen.

JACQUEMONT, VICTOR; 1801-32; was a French botanist and explorer, who in 1829 was selected by the French natural science committee to conduct a scientific survey of eastern Asia. Arriving in Calcutta the same year, he crossed the Himalayas, and reached Chinese Tartary, but, unfortunately, his premature death, upon his return to Bombay, put a stop to his researches.

JACQUERIE (see JACK), the name given to the insurgent peasants in France in the middle of the 14th c., in the reign of John. The insurrection of the jacquerie broke out in the year 1358, when the French king was a prisoner in England, and France in a state of the greatest disorder and anarchy. The immediate occasion of it was the enormities perpetrated by Charles the Bad, king of Navarre, and his adherents; but it was really caused by long-continued oppression on the part of the nobles. Suddenly rising against their lords, the peasants laid hundreds of castles in ruins, murdered the nobles, and violated their wives and daughters, practicing every enormity, and acting, as they said, on the principle of doing as had been done to them. The insurrection broke out in the neighborhood of Paris, but extended to the banks of the Marne and the Oise. For some weeks this part of France was entirely at their mercy; but the magnitude of the danger induced the quarrelsome nobles to make common cause against them, and on June 9 the peasants were defeated with great slaughter near Meaux by Captal de Buch and Gaston Phébus, count of Foix. This put an end to the insurrection.

JACQUES-CARTIER, a co. in Quebec, Canada, which comprises a portion of Montreal island. Pop. 11,179. Co. seat, Mount Claire.

JACTITATION OF MARRIAGE is a suit which was formerly competent in the English ecclesiastical courts, and now is competent in the English divorce court, to settle a question of disputed marriage. If a party boast or profess that he or she is married to another, the latter may institute the suit, and call upon the former to produce proof of the marriage. If this is not done, then a decree passes which enjoins the party to perpetual silence on the subject. This remedy is now scarcely ever resorted to, for, in general, since lord Hardwick's act (1766), there is sufficient certainty in the forms of legal marriage in England to prevent any one being in ignorance whether he or she is really married or not—a reproach which, however, is often made against the law of Scotland. The Scotch suit of a declarator of putting to silence, which is equivalent to jactitation of marriage, is often resorted to, the latest and most notorious instance of its use being that in the Yelverton marriage case.

JADE, a name somewhat vaguely applied to a number of minerals, not very dissimilar—nephrite, axestone, serpentine, etc. Nephrite and axestone appear to be the minerals of which *jade* ornaments are generally made. But **YU**, or Chinese jade of which very beautiful vases and other articles are made in China, is supposed to be prehnite (q.v.). Jade of all kinds has a greenish color, and when polished, has a rather dull and greasy aspect.

JA'DE, or **JAH'DE**, the name of a river, bay, and territory, in Prussia (Oldenburg), on the North sea, immediately w. of the mouth of the Weser. The river is navigable; it drains the district of Oldenburg, and empties into Jade bay. The bay originated in an inundation in 1511; when the sea, driven by a violent tempest, overflowed the land, covering a tract 74 sq.m. in extent. The territory of the same name covers one and one-third sq.m.: pop. '71, 3,789; and since 1873 has been incorporated into Hanover. The port of Jade is named Wilhelmshaven, and comprises a tract of land near the mouth of the river, purchased from Oldenburg by Prussia in 1853. It is an extensive naval station, and was opened by the king of Prussia in person, June 17, 1869. By an elaborate engineering system, including a canal and docks walled with granite, wharves, and extensive basins, the whole system being strongly fortified, this has been made one of the best defended and most important European stations.

JAEN, formerly an independent Moorish kingdom, is now a province of Spain, forming a portion of the old province or kingdom of Andalusia (q.v.). It lies wholly within the basin of the Guadalquivir. Area, 5,184 sq.m.; pop. '70, 392,100. Conquered by the Moors on their entrance into Spain, Jaen maintained its independence as a Moorish state till 1234, when it fell into the hands of Ferdinand III., and was added to the kingdom of Castile.

JAEN, a city of Spain, capital of the province of the same name, is most picturesquely situated in a mountainous district, at the foot of a rugged castle-crowned hill, on the Rio de Jaen, a tributary of the Guadalquivir, about 50 m. n. of Granada. It is surrounded by old Moorish walls, surmounted by numberless towers and pinnacles. Though situated in the midst of plenty, in a fertile neighborhood, the town is poor. The principal buildings are two cathedrals and several hospitals. Outside the walls are charming well-watered fruit-gardens. Pop. 18,054. In former times the town was called *Jayyenu-l-harir*, "Jaen of the Silk," on account of its silk manufactures, for which it was, but is no longer, famous.

JAF'FA. See **JOPPA**.

JAFFNA (*ante*), a district comprising several islands separated by narrow creeks, which lies n. of the island, and is included in the province, of Ceylon. It is 40 m. long and 15 wide; its population about 148,000, of whom 650 are whites, mostly descendants of the Dutch and Portuguese, the former conquerors of Ceylon. It is now subject to the crown of England. The natives are of the Tamil race, and are said to have begun to emigrate from the continent previous to B.C. 101. They are mostly idolaters. With the whole of Ceylon Jaffna became subject to the Portuguese early in the 16th century. The Dutch took it from them in 1658, and the English conquered it in 1795. When the Portuguese held the district they baptized large numbers of natives, and some thousands still adhere to the Roman church. The American board and some English societies have sent missionaries there, and through their labors many have professed the Christian faith, and Christian truth has largely permeated the mass of the people. The entire district is but little elevated above the sea. Rice is cultivated on the lower lands, which are submerged during the rainy season. On the higher land are villages with groves of palms, cocoa-nut, palmyra, banana, areca-nut and other trees, fields of inferior grains, and gardens which yield yams, betel, tobacco, and various fruits. All these products require irrigation. The native name for Jaffna is *Yarlpanum*, from *Yarlpanan*, a performer on the lyre, by corruption *Yarlpana*, *Yapna*, *Japna*, *Jafna*. A tradition is held by the people to the effect that about 2,000 years ago a blind lyrist obtained, by his musical skill, from the king of Ceylon a grant of the district, and named it from his own profession; that he made himself king; but in the year of Thali, 3,000 (B.C. 101), he resigned in favor of a king of the Solen race from the Coromandel coast, and that the descendants of this king reigned in Jaffna for 1400 years. There is said to be also an inscription in stone which relates that the lyrist, by the aid of 1000 men, transformed the district that was a sand heap into a garden by planting the various fruit trees which now abound. It, however, contradicts the legend in saying that in the year of Thali 3,000 he placed on his throne a son of the king of Ceylon.

JAFFNAPATAM', a seaport in Ceylon, on a peninsula at the n. extremity of the island, with a population of 8,000. The place is of Dutch origin, and a large proportion of the population of Dutch descent.

JAFFNAPATAM', or **JAFFNA CITY**, is a fortified t. on an island forming part of a cluster of islands which lie n. of Ceylon, but which are usually designated as part of that island. The fort is small, but well built of blocks of white coral and is surrounded by a moat. Within it are a church in the shape of a Grecian cross, a fine house for the English commanding officer, and other English residences. The population of the town is about 4,000, natives, moormen, and whites, occupying distinct quarters. The streets

are at right angles, between 40 and 50 ft. wide. The houses are of stone, white with chunam, having but one story, which is about 20 ft. in extreme elevation. Most of them have piazzas, and are surrounded with flowers, shrubbery, and shade trees. The town has a clean and neat appearance. There are manufacturers who produce various fabrics from the cotton of the cotton-tree; also artificers in gold, silver, and wood.

JAGEL'LONS, THE, the name of an illustrious dynasty which reigned in Lithuania, Poland, Hungary, and Bohemia. The name is derived from Jagellon, the last of a long line of hereditary grand dukes of Lithuania, who succeeded to his patrimonial possession in 1381, and was (1386) appointed successor to his father-in-law, Lewis the great, king of Poland and Hungary, in the former of these kingdoms, after having embraced Christianity, and changed his name to Wladislas IV. He was engaged during the whole of his reign in repelling the attacks of the Teutonic knights, whom he finally overthrew by the help of the Hussites of Bohemia. He made an unsuccessful attempt to wrest Hungary from the emperor Sigismund, founded the university of Cracow in 1400, and died in 1434 at Grodek. His son, Wladislas V., king of Poland (1434-44), was also elected king of Hungary on the death of Albert of Austria in 1439, mainly through the assistance of John Hunyady (q.v.), vaivode of Transylvania. After a war of two years' duration with the emperor Frederick III., Wladislas turned his sword against the Turks, drove them repeatedly from Moldavia, Wallachia, and Bulgaria, and returned to his capital of Buda loaded with spoils. In 1444 Amurath II. sued for peace, which the warlike Wladislas granted, swearing a solemn oath by the holy Evangelists; but the pope having, in defiance of all truth and equity, sent cardinal Julian to cause a rupture of the treaty, and absolve Wladislas from perjury, that gallant prince summoned to his side John Hunyady, and being joined by Scanderbeg, at the head of an auxiliary force of Epirotes, invaded Turkey, but was totally defeated and slain at Varna (Nov. 10, 1444), cardinal Julian being also left dead on the field. He was succeeded in Poland by his brother Casimir IV. (1444-92), whose three sons, John Albert (1492-1501), Alexander (1501-06), and Sigismund (1506-48), reigned in succession. Sigismund August (1548-70), the son of this last, and one of the wisest of the Polish monarchs, added Livonia to his kingdom, and passed an edict of universal toleration. His sisters, Anne and Catherine, married respectively Stephen Bathori of Transylvania, and John III. of Sweden, and the Jagellon dynasty was continued on the Polish throne till 1668.

Wladislas, the fourth son of Casimir IV. of Poland, was elected king of Bohemia in 1471, on the death of George Podiebrad, and also succeeded Mathias Corvinus in Hungary in 1490. Wladislas died in 1516, and was succeeded in both kingdoms by his son, Lewis II., who was defeated and slain by the Turks at Mohacs (Aug. 29, 1526), and with whom terminated the Jagellons of Bohemia and Hungary.

JA'GER. See SKUA.

JÄ'GERNDORF, a small t. of Austrian Silesia, is situated on the Oppa, 14 m. n.n.w. of Troppau, has manufactures of cloth, hosiery, and linen. Pop. '69, 8,442.

JAGGAR, THOMAS AUGUSTUS, D.D., b. 1839; bishop of the Protestant Episcopal diocese of southern Ohio. He graduated at the General theological seminary, N. Y., and took holy orders 1860. He is the founder of the Riverside hospital at Yonkers, N. Y.; was successively rector of Anthon Memorial church, New York, of St. John's, Yonkers, and of Holy Trinity, Philadelphia.

JAG'GERNAUT. See JUGGERNAUT, *ante*.

JAG'GERY, the name given in the East Indies to the sugar obtained by inspissation from the sap (*nera* or *toddy*) of palms. The sap of many species of palm yields jaggery, and probably that of almost all species might be made to yield it. The cocoa-nut yields much of the jaggery of some parts of the east. It is, as generally sold and used in the East Indies, a coarse kind of sugar; chemically, it is the same with cane-sugar. The sap, which by inspissation yields jaggery, becomes also, by fermentation, palm-wine, and from it by distillation arrack is made.

JAGUAR', *Felis onça*, one of the largest of the cat tribe, and by far the most powerful and dangerous of the American beasts of prey. It is sometimes called the American tiger. It is nearly equal to the tiger in size; the head is large, the body thick, and the limbs robust; the tail is long, and of equal thickness throughout. The color varies considerably, but is usually a rich yellow, with large black spots and rings, small black spots generally appearing within the rings, a mark by which the skin of the jaguar may be readily distinguished from that of the other large spotted or ringed *felidae*. A black or very dark-brown variety occurs, but the characteristic markings may be seen in certain lights, deeper in color than the rest of the fur. The jaguar is strong enough to drag away a horse, and swift enough to capture horses on the open pampas. It is chiefly, however, an inhabitant of forests. It abounds so much in some districts, that settlements have been deserted on account of the destruction of domestic animals. It climbs trees, however smooth the stem, and moves about with great agility among the branches, making even monkeys its prey. Instances of its attacking man, although they sometimes occur, are not frequent, but it is bold enough to approach inclosures, and even to enter villages in broad daylight, in quest of prey. The jaguar is often taken in traps; and it is sometimes hunted with dogs, when it generally at last

takes refuge in a tree, and is there shot. The skins of jaguars are exported from South America in great numbers. The jaguar is found in almost all parts of South America, but its range does not extend n. of the isthmus of Darien. It is called OUNCE (*onça*) in some parts of South America.

JAH'DE. See JADE.

JAHN, FRIEDRICH LUDWIG, 1778-1852; an eccentric German, who was the first to introduce gymnastics into the Prussian army. His theories were fantastic and absurd, but he accomplished much by the increased attention which he invoked for physical education, especially for soldiers. He established schools for gymnastics, which became political centers; and although as long as war with France lasted, they served to increase the enthusiasm and patriotism of the people, when peace was finally concluded, Jahn, with his excited followers, was looked upon as a demagogue, and cited by the Prussian government as a stirrer up of the people. He was imprisoned; and was liberated only upon condition of never establishing himself in a university town. He settled at Freiburg, and devoted his energies to writing and publishing, becoming more exaggerated in his views and actions. In 1833 he was elected to the national assembly. His principal writings were: *Runenblatter*, *Neue Runenblatter Merken zum Deutschen Volksthum*, and *Die Deutsche Turnkunst*.

JAHN, JOHANN, a distinguished Roman Catholic orientalist and biblical critic, was b. at Tasswitz, in Moravia, June 18, 1750, received his early education at Znaim and Olmütz, and in 1772 entered the Premonstratensian convent of Bruck, where he took his vows in 1774, and was appointed professor of oriental languages and biblical criticism. On the suppression of this convent, in 1784, Jahn was transferred to the same professorship in Olmütz, and finally to the university of Vienna, where he also undertook the chair of dogmatic theology. So far as regards the Roman Catholic literature of Germany, Jahn may be regarded as the father of biblical criticism. But the boldness of some of his opinions having aroused the alarm of the ecclesiastical authorities, he was honorably removed from his chair in the university, by being promoted to a canonry of St. Stephen's at Vienna, in 1803. He continued, however, to pursue the same studies with great reputation till his death in 1816, and published many works in both departments, the most important of which, passing over his grammars, lexicons, and elementary books of the Hebrew, Syriac, Chaldaic, and Arabic languages, are his *Introduction to the Old Testament*, 2 vols. 1792, and again in 4 vols., 1802-03; *Biblical Archaeology*, 5 vols., 1797-1805, of both which works a compendium appeared in 1804, and again in 1814; a *Manual of General Hermeneutics*, 1812; an appendix of dissertations to this work, 2 vols., in 1813-15; and an edition of the Hebrew Bible, 4 vols., 1806. Five years after his death a collection of posthumous *Remains* was published at Tübingen, 1821, the genuineness of which, although seemingly without reason, has been called in question. His works have gone through many editions in Germany, and have been translated into several languages.

JAHN, OTTO, 1813-69; b. Kiel; studied under Lachmann and Gerhardt, at Berlin; lectured in his native town on archæology and philology, and traveled in southern Europe under the pay of the Danish government. Being made professor of philology at Leipsic in 1847, he became involved in the revolutionary outbreak of the following year, particularly in the attempt to separate Holstein from Denmark, and was deprived of his position in 1850. He was appointed in 1855 professor of archæology at Bonn. He devoted much time and thought to musical studies, and wrote a life of Mozart, which was published in 1856. He also wrote essays on philology and archæology.

JAHR, GEORGES HENRI GOTTLIEB, b. Germany, 1801; studied medicine under Hahnemann, and became one of the most prominent professors of the homeopathic system. He wrote a number of works on special diseases and their treatment by the new practice, and his *Homeopathic Pharmacopœia* is considered a standard authority in that school. His works have been translated into French and English.

JAIL FEVER (known also as putrid or pestilential fever) is now considered to be merely a severe form of typhus fever (q.v.), and not a distinct disease. At the present time, owing to improved sanitary regulations, this form of disease is almost unknown; but we learn from Howard's *Account of the State of Prisons*, that, in his time, the disease was very frequent in the prisons of England, although unknown in those of the continental countries. In the celebrated Black Assize (q.v.), held at Oxford in 1577, there is no evidence that the disease prevailed amongst the prisoners, and yet it broke out among the persons present at the trial. It is little more than a century and a quarter ago (May, 1750) that the lord mayor, an alderman, judges, most of the jury, and a large number of spectators caught this disease from attending the assizes at the Old Bailey; and many of those who were infected died.

JAIL, or GAOL. See PRISON.

JAINAS is the name of a heterodox sect of the Hindus, numerous adherents of which are found in every province of Upper Hindustan, in the cities along the Ganges, and in Calcutta, but more especially to the westward, the provinces of Mewar and Marwar being apparently the cradle of the sect. They are also numerous in Guzerat, in the

upper part of the Malabar coast, and are scattered throughout the peninsula. They form a large and, from their wealth and influence, an important division of the population of India. The name of the sect means a follower of *Jina*, the latter being one of the denominations of their deified saints; and as another name of these saints is *Arhat*, their followers are also called *Arhatas*.

The tenets of the Jainas or Arhatas are in several respects analogous to those of the Buddhists (see BUDDHA), but they resemble in others those of the Brahmanical Hindus. With the Buddhists, they share in the denial of the divine origin and authority of the Veda, and in the worship of certain saints, whom they consider superior to the other beings of their pantheon. They differ, indeed, from them in regard to the history of these personages, but the original notion which prevails in this worship is the same. With the Brahmanical Hindus, on the other hand, they agree in admitting the institution of caste, in performing the essential ceremonies called *Sanskāras* (q.v.), and in recognizing some of the subordinate deities of the Hindu pantheon, at least apparently, as they do not pay especial homage to them, and as they disregard completely all those Brahmanical rites which involve the destruction of animal life. It deserves notice, too, that though rejecting in general the authority of the Vedas, they admit it, and quote the Vedic text, if the doctrines of the latter are conformable to the Jaina tenets.

According to their doctrine, all objects, material or abstract, are arranged under nine categories, called *tattwas*, truths or principles, of which we need notice only the ninth and last, called *moksha*, or liberation of the vital spirit from the bonds of action—i. e., final emancipation. In reference to it, the Jainas not only affirm that there is such a state, but they define the size of the emancipated souls, the place where they live, their tangible qualities, the duration of their existence, the distance at which they are from one another, their parts, natures, and numbers. Final emancipation is only obtained “in the state of manhood (not in that of a good demon or brute), while in possession of five senses, while possessing a body capable of voluntary motion, in a condition of possibility, while possessing a mind, through the sacrament of the highest asceticism, in that path of rectitude, in which there is no retrogression, through the possession of perfect knowledge and vision, and in the practice of abstinence.” Those who attain to final liberation do not return to a worldly state, and there is no interruption to their bliss. They have perfect vision and knowledge, and do not depend on works. See J. Stevenson, *The Kalpa Sūtra and Nīva Tattva*.

The principles of faith, as mentioned before, are common to all classes of Jainas, but some differences occur in the practice of their duties, as they are divided into religious and lay orders, *Yatis* and *Srāvakas*. Both, of course, must place implicit belief in the doctrines of their saints; but the *Yati* has to lead a life of abstinence, taciturnity, and continence; he should wear a thin cloth over his mouth, to prevent insects from flying into it, and he should carry a brush to sweep the place on which he is about to sit, to remove any living creature out of the way of danger; but, in turn, he may dispense with all acts of worship; whilst the *Srāvaka* has to add to the observance of the religious and moral duties the practical worship of the saints, and a profound reverence for his more pious brethren. The secular Jaina must, like the ascetic, practice the four virtues—liberality, gentleness, piety, and penance; he must govern his mind, tongue, and acts; abstain, at certain seasons, from salt, flowers, green fruits, roots, honey, grapes, tobacco; drink water thrice strained, and never leave a liquid uncovered, lest an insect should be drowned in it; it is his duty also to visit daily a temple where some of the images of the Jaina saints are placed, walk round it three times, make an obeisance to the image, and make some offerings of fruits or flowers, while pronouncing some such formula as “Salutation to the Saints, to the Pure Existences, to the Sages, to the Teachers, to all the Devout in the world.” The reader in a Jaina temple is a *Yati*, but the ministrant priest is not seldom a Brahman, since the Jainas have no priests of their own, and the presence of such Brahmanical ministrants seems to have introduced several innovations in their worship. In Upper India, the ritual in use is often intermixed with formulas belonging more properly to the S'āiva and S'ākta worship (see Hindu Sects under INDIA), and images of S'iva and his consort take their place in Jaina temples. In the s. of India, they appear, as mentioned before, to observe also all the essential rites or *Sau-skāras* of the Brahmanical Hindu. The festivals of the Jainas are especially those relating to events in the life of their deified saints; but they observe also several common to other Hindus, as the spring festival, the S'ripanchami, and others.

The Jainas are divided into two principal divisions, *Digambaras* and *S'wetāmbaras*. The former word means “sky-clad,” or naked, but in the present day, ascetics of this division wear colored garments, and confine the disuse of clothes to the period of their meals. *S'wetāmbara* means “one who wears white garments;” but the points of difference between these two divisions are far from being restricted to that of dress; it is said to comprehend a list of 700 topics, of which 84 are considered to be of paramount importance. Amongst the latter are mentioned the practice of the *S'wetāmbaras* to decorate the images of their saints with ear-rings, necklaces, armlets, and tiaras of gold and jewels; whereas the *Digambaras* leave their images without ornaments. Again, the *S'wetāmbaras* assert that there are 12 heavens and 64 Indras; whereas the *Digambaras* maintain that there are 16 heavens and 100 Indras. In the s. of India, the Jainas are divided into two castes; in Upper Hindustan, they are all of one caste. It is remarkable,

however, that amongst themselves they recognize a number of families between which no intermarriage can take place, and that they resemble, in this respect also, the ancient Brahmanical Hindus, who established similar restrictions in their religious codes.

As regards the pantheon of the Jaina creed, it is still more fantastical than that of Brahmanical sects, whence it is borrowed to a great extent, but without any of the poetical and philosophical interest which inheres in the gods of the Vedic time. The highest rank amongst their numberless hosts of divine beings—divided by them into four classes, with various subdivisions—they assign to the deified saints, which they call *Jina*, *Arhat*, or *Tirthakara*, besides a variety of other generic names. The Jainas enumerate twenty-four Tirthakaras of their past age, twenty-four of the present, and twenty-four of the age to come; and they invest these holy personages with thirty-six superhuman attributes of the most extravagant character. Notwithstanding the sameness of these attributes, they distinguish the twenty-four Jinas of the present age from each other in color, statue, and longevity. Two of them are red, two white, two blue, two black; the rest are of a golden hue, or a yellowish-brown. The other two peculiarities are regulated by them with equal precision, and according to a system of decrement, from *Rishabha*, the first Jina, who was 500 poles in stature, and lived 8,400,000 great years, down to *Mahâvîra*, the 24th, who had degenerated to the size of a man, and was no more than 40 years on earth, the age of his predecessor, *Pârs'wanâtha*, not exceeding 100 years. The present worship is almost restricted to the two last Tirthakaras; and as the stature and years of these personages have a reasonable possibility, H. T. Colebrooke inferred that they alone are to be considered as historical personages. As, moreover, amongst the disciples of *Mahâvîra* there is one *Indrabhûti*, who is called *Gautama*, and as *Gautama* is also a name of the founder of the Buddha faith, the same distinguished scholar concluded that, if the identity between these names could be assumed, it would lead to the further surmise that both these sects are branches of the same stock. But against this view, which would assign to the Jaina religion an antiquity even higher than 543 before Christ—the date which is commonly ascribed to the apotheosis of *Gautama* Buddha—several reasons are alleged by prof. Wilson. As to the real date, however, of the origin of the Jaina faith, as the same scholar justly observes, it is immersed in the same obscurity which invests all remote history amongst the Hindus. We can only infer from the existing Jaina literature, and from the doctrines it inculcates, that it came later into existence than the Buddhist sect. The best essays on the tenets, mythology, observances, and literature of this sect are those by Colebrooke in his *Miscellaneous Essays*, and by Wilson in the first volume of his works (London, 1862).

JAKJOKERTA, **JAKYOKARTA**, or **YUGYAKARTA**, capital of the Dutch residency of the same name in Java; pop. 50,000. It is the seat of a native sultan, a Dutch resident and assistant resident, and has many Europeans. A curious feature of the town is the sultan's water-palace, built on a terraced island, with subterranean approaches, walls, and towers. It is falling into decay. The residents and the Europeans dwell in the fort, which commands the palace and town. There is a church, school, and shot-foundry. The sultan has a body-guard of young females.

JAKUTSK' (*Yukootsk*), chief t. of the government of that name in eastern Siberia (see **SIBERIA**). It is situated on the left bank of the river Lena, lat. $62^{\circ} 1'$ n., long. $129^{\circ} 44'$ e.; distance from St. Petersburg, 5,751 m.; pop. '67, 4,982 inhabitants. The whole industry of the town consists in candle-works, but it is, notwithstanding, the principal market of eastern Siberia for traffic with the native hunting tribes of the Jakuts and Buriats. The former, mostly nomadic tribes, possessing large herds of cattle and horses, bring butter to the market, which is dispatched on horseback to the port of Okhotsk. The latter, also a nomadic tribe, bring to Jakutsk great quantities of furskins, of sables, foxes, martens, squirrels, bears, hares, etc. The most animated periods of the year are the months of May and June; in the former, the goods are dispatched to the sea-ports; in the latter, an important fair takes place annually, during which the quantity of merchandise sold, chiefly furs and mammoth tusks, amounts to £50,000 in value. Manufactured goods, hardware, etc., are brought from Irkutsk by the Lena.—The recently organized government of Jakutsk has an area of 1,511,228 sq.m., and a pop. of 231,997.

JAL'AP, a well-known purgative medicine, is the root of *exogonium purga*, a plant of the natural order *convolvulaceæ*. It is found in Mexico, at an elevation of about 6,000 ft. above the level of the sea, in the neighborhood of the town of Jalapa or Xalapa, from which the name jalap is derived. It is a perennial twining plant, with large flowers and a turnip-like root, varying from the size of a hazel-nut to that of a man's fist. The roots when fresh are white and fleshy, and abound in a milky juice. They are prepared for the market by drying.—Jalap was long erroneously referred to other plants, amongst others *mirabilis Jalapa*, known in our flower-gardens as *marvel of Peru*.—The root known as *male jalap* or *he jalap*, with which the true jalap of commerce is often adulterated, was recently declared by Mr. Hartweg to be *iporuru batatooides*. Its properties are somewhat similar to those of true jalap, but it is very inferior.

Jalap seems to have been first introduced into this country as a medicine about 1609. The dried roots are brown and wrinkled externally, and of a deep yellowish-gray color internally; their odor is faint and disagreeable, and their taste is nauseous. The

active ingredient is the resinous portion, which varies from about 10 to nearly 20 per cent, and which is composed of two distinct substances, *jalapine* ($C_{42}H_{34}O_{20}$) and *jalapic acid*. Jalap resin may be distinguished from common resin by its insolubility in volatile oils. Jalap is a valuable cathartic, but is seldom given alone. Its purgative action is increased by the addition of a little calomel, and its hydragogue action by bitartrate of potash, while its tendency to produce griping is obviated by the addition of a little ginger. It is extremely useful in those febrile affections of children which are associated with constipation; and in diseases of the brain it is a good purgative to select, in consequence of its derivative action. In the form of *compound jalap powder*, which consists of one part of powdered jalap, two parts of bitartrate of potash, and a little ginger, it is of great service in some kinds of dropsy, in consequence of its hydragogue action.

The ordinary dose of powdered jalap for an adult varies from 10 to 30 grains, a scruple generally acting smartly and safely; for children under a year old the dose is from 2 to 5 grains. The dose of the compound powder is double that of the ordinary powder. The *tincture of jalap*, in the dose of 1 or 2 drams, is a useful addition to the ordinary black draught when it is desired to increase its activity.

JALA'PA, a city in the Mexican confederation, is second in importance among the towns of the state of Vera Cruz. It is on the grand route between the capital of the country and the sea-port of Vera Cruz, and is about 60 m. w.n.w. from the latter. Situated at an elevation of 4,335 ft. above the level of the sea, its climate may be said to be that of the temperate region, and it is a favorite resort of the invalids of the coast. Pop. about 10,000.

JALISCO, an important Mexican state on the Pacific ocean, formerly the kingdom of Nueva Galicia; it now comprises 9 cantons, or districts; 48,967 sq.m., pop. '70, 966,689. The surface of the country is varied, chiefly mountainous, but in the valleys fertile and beautiful. It is well watered by a number of streams, the Lerma, or Rio Grande de Santiago, 600 m. in length, being the largest. There are numerous lakes, of which the most important is Chapala, 90 m. long, and 10 to 35 m. wide. The volcano of Colima is about 12,000 ft. in height. Nearly all the tropical products can be grown in this province, sugar-cane, in particular, being very successful. It is also a rich mining country, but is little worked. The population is composed, mainly, of tribes of native Indians. Capital, Guadalajara.

JAMAI'CA, aboriginally *Xaymaca*, or *land of wood and water*, one of the West India islands, and by far the most important of those belonging to Great Britain, is about 90 m. to the s. of Cuba, and stretches in n. lat. between $17^{\circ} 40'$ and $18^{\circ} 30'$, and in w. long. between $76^{\circ} 15'$ and $78^{\circ} 25'$. Area, 6,400 sq.m. (rather more than that of Yorkshire); greatest length, 150 m.; greatest breadth, 50 miles. It is traversed from e. to w. by a heavily-timbered ridge, called the Blue mountains, which rises to about 7,000 feet. From this range, at least 70 streams descend to the n. and s. shores, but owing to the shortness and declivity of their courses they are not navigable, with the exception of one, the Black river, which affords, for small craft, a passage into the interior for 30 miles. Excellent harbors are everywhere to be found. But incomparably the best of these is formed by a deep and capacious basin in the s.e. quarter of the island, which washes the most spacious and fertile of the plains between the hill-country and the coast. Around this inlet, and within a few miles of each other, are all the considerable centers of population, Port Royal, Kingston, and Spanish Town.

The climate varies considerably—the torrid belt of the coast gradually passing into the temperate region of the central heights. The latter is said to be remarkably favorable to longevity; and, after having long been a retreat for the residents themselves, it has lately begun to attract invalids from the United States. To contrast two positions—the one near Kingston harbor, and the other at the intermediate elevation of 4,000 ft.—their annual means are stated to be respectively 81° F. and 68° F. Earthquakes have occasionally occurred, one of them, in 1692, having almost overwhelmed Port Royal.

In 1861 the total population amounted to 378,433, of whom 13,816 were whites, and the remainder half-breeds or blacks. At the last census, that of 1871, the total population was 506,154, of whom only 13,101 were whites. It thus appears that in the preceding ten years there had been a falling off in the white population; while the blacks, or colored men, had rapidly increased. On the productiveness and trade of the island, the emancipation of the slaves in 1834 had an unfavorable effect. But even previously to the new order of things, the commercial crops had been steadily decreasing. To take by itself the grand staple of sugar, the last 3 years of the slave-trade, 1805–7, had averaged fully 144,000 hogsheads; the four years before the commencement of the abolition of slavery, 1831–34, under 91,000; the four years of gradual abolition, 1835–38, nearly 70,000; the first four years of perfect freedom, 1839–42, less than 42,000. That a revival of trade has set in appears from the last returns, according to which the values of sugar exported were, in 1869, £443,078; in 1870, £491,616; and in 1871, £592,163. In 1871 the chief exports were in value as follows: sugar, £592,163; rum, £271,267; coffee, £147,562; logwood, £115,423; while the chief imports were flour, £135,500, and salt fish, £92,801. In 1875 the total imports of Jamaica were valued at £1,760 000, and its exports at £1,410,000. In 1860 the revenue amounted to £262,239, and the

expenditure to £255,239. In 1875 the revenue amounted to £591,000; the expenditure to £586,000.

Jamaica was discovered by Columbus during his second voyage, in 1494, and was taken possession of by the Spaniards in 1509. So great was the inhumanity of the conquerors, that 50 years after the Spanish invasion of the island the native population is said to have entirely disappeared. On May 3, 1655, a British expedition sent out by Oliver Cromwell, under admirals Penn and Venables, assailed and captured the island, which was formally ceded to England by the treaty of Madrid in 1670. Under English rule, the chief events in the history of the island were, in 1795, the rebellion of the Maroons, a community of runaway slaves, who had obtained a tract of land on the n. side of the island; in 1831, a negro insurrection; and on Aug. 1, 1834, the emancipation of the slaves. The last event was followed by ill-judged concessions of representative and constitutional rights to the newly-liberated blacks. The experiment proved a failure. The blacks considered it a grievance that offices in the magistracy were not more frequently conferred on them. They wished to suppress coolie immigration, which tended to keep down wages. They sought to obtain land without rent, and the more violent even suggested the expulsion of the whole white population of the island.

In 1865 the discontent was at its height. In October of that year, a decision of the local court at Morant Bay against a black squatter, led to a negro rising and the massacre of 23 whites. Martial law was proclaimed by gov. Eyre, 1000 houses were burned, some rebels were hanged, others were flogged, but the rebellion was most effectually suppressed. For the course he had taken, gov. Eyre was thanked by the Jamaica assembly; but in England a different view was taken of his conduct (see EYRE). He was recalled, and the representative constitution was suspended. Sir P. J. Grant was appointed governor, with entire authority to manage the affairs of Jamaica, with the aid of advisers nominated as in the other West India islands. There seems to be good authority for the statement that from the catastrophe of 1865, which proved so nearly fatal to the island, a new life has sprung. Crime has diminished; education has everywhere advanced among the black population, the number of schools in the island in 1876 (569) being just double the number in existence in 1868. A collection of Jamaica products was exhibited with very satisfactory results at the Philadelphia exhibition of 1876, 31 awards having been obtained by the island. New roads have been formed, harbors are being constructed, and an irrigation canal is in progress which will give fertility to 50,000 acres of the beautiful plain between Spanish Town and Kingston. Thanks to the Cuban refugees, who have taken several of the long-forsaken sugar estates, property is looking up, and the official statements show that the export trade is increasing. Although Jamaica has not recovered its former commercial prosperity, the negroes cannot now be described as idle. They cultivate their provision grounds with care, and produce for sale enough sugar and coffee to obtain a considerable supply of imported and manufactured articles. Extreme poverty is unknown among them, and under their present government they are described as a law-abiding and inoffensive community. Well-informed and experienced visitors to the island have strongly recommended energetic young Englishmen of the wealthier class, who contemplate emigration, to take their capital to the highlands of Jamaica, and to settle there rather than in the United States or in South America.

JAMAICA, a village on Long Island, Queens co., N. Y.; pop. '80, 10,089; reached by the Long Island, South Side, and Brooklyn Central railroads from Brooklyn, and in favor with New York business men for suburban residence. It is a thriving place, depending in a considerable measure on its market gardening interest, and its contiguity to New York; but having also some important manufactures. A good library and public school system, an energetic fire department, 6 churches, an academy, banks, newspapers, etc., are its chief public institutions.

JAMAICA BARK. See CARIBBEE BARK.

JAMAICA PEPPER. See PIMENTO.

JAMAICA PLAIN, a village in Massachusetts, since 1874 incorporated (with West Roxbury) as the 17th ward of Boston; three miles distant from the city proper, with which it is connected by horse railroad. It is a thickly settled and attractive suburb, and a favorite place of residence with persons doing business in the city. It borders on Jamaica pond, a beautiful sheet of water whose picturesque shores are lined with elegant residences.

JAMALTI'CA, the locality of a group of ruins, situated 20 m. n. of Comayagua in Honduras, and exhibiting a series of mounds, whose summits are reached by flights of steps, above which are remains indicating the former presence of considerable edifices. The largest of these mounds stands in the center of a broad terrace, and the smaller ones are arranged at regular distances from it. Excavations in the surrounding country have brought to light many ancient vases and pieces of sculpture, which indicate, in the excellence of their workmanship, the existence of a high standard of art and a marked ability.

JAMB, in architecture, the side of the apertures in walls, such as doors, windows, fireplaces, etc.

JAMBOS. See EUGENIA.

JAMES, a co. in s.e. Tennessee, on the boundary line of Georgia, with the Tennessee river on the n.w.; 200 sq.m.; pop. 5,000. The general conformation of the country is mountainous, containing coal and iron. The soil is fertile, and easily cultivated. This co. is intersected by the East Tennessee, Virginia, and Georgia railroad. Co. seat, Ooltewah.

JAMES (Gr. *Jacōbos*, and really the same word as Jacob) is the name borne by two or three persons in the New Testament. These are James the son of Zebedee, and James the "brother" or "cousin" of our Lord, who is considered by many to be the same as James the son of Alpheus. JAMES the son of Zebedee, surnamed the *Elder*, was the brother of the apostle John, and before his call to the apostleship was a fisherman. After the ascension of Christ, he seems to have remained at Jerusalem, and was the first of the apostles to suffer martyrdom, being slain by Herod in the year 44 A.D. There is an incredible legend of his having planted the gospel in Spain, and he is the patron saint of that country. JAMES the "brother" or "cousin" of our Lord, surnamed the *Less*, the other apostle of this name, appears to have resided, like James the *Elder*, chiefly in Jerusalem. From the glimpses of him which are obtained in the Acts of the Apostles and the Epistle to the Galatians, it is clear that he presided over the mother-church of Jerusalem. According to the tradition recorded by Hegesippus (who flourished about the middle of the 2d c.), he was considered a miracle of "righteousness," even by the unbelieving Jews, who gave him the name of the *Just*. The enmity of the more bigoted Jews, however, procured his condemnation, and the high-priest Ananus gave order that he should be stoned to death. According to Josephus, the execution of the sentence excited great dissatisfaction among the people of Jerusalem. The date of his death cannot be precisely fixed, but it was probably about 62 or 63 A.D. THE EPISTLE GENERAL OF JAMES is regarded by most theologians as a composition of his. The primitive church, however, placed it sometimes among the *antilegomena* (or scriptures of doubtful genuineness), and sometimes even among the *notha* (or spurious scriptures). In the 4th c. its authority increased, and the Council of Carthage (397 A.D.) pronounced it "canonical." This, of course, did not settle the question of its authenticity; and at the period of the Reformation, both its authenticity and religious teaching were attacked by Erasmus and Cajetan (in the Roman Catholic church), by Lucar (in the Greek church), and by Luther, who called it "a downright strawy epistle," the work of some unknown James, who misunderstood the doctrines of the apostle Paul. Modern divines, generally, profess to see no discrepancy between the teaching of the two apostles, and imagine that they are looking at the same great verity from different, but not contradictory stand-points (see JUSTIFICATION). The style is clear, polished, and poetical, very little disfigured with Hebraisms, and indicating that its possessor was a man of superior culture. Compare Alford's *Greek Test.*, vol. 4 (Lond., 1859).

JAMES I. OF ENGLAND AND VI. OF SCOTLAND (1567 [England 1603]–1625), only son of Mary queen of Scots and Henry lord Darnley, was b. within the castle of Edinburgh, June 19, 1566. On his mother's forced resignation of the crown, James was proclaimed king of Scotland, July 29, 1567. The direction of his childhood devolved principally on the earl of Mar. His classical education he received from the famous George Buchanan. In 1578 the earl of Morton, then regent, was driven from power, and James nominally assumed the direction of affairs. But the new government was unpopular, and Morton soon succeeded in re-establishing himself. His fall was, however, ultimately effected by the united influence of the duke of Lennox and of the earl of Arran. Morton was condemned and executed on the charge of having been accessory to the murder of Darnley. After his death, Lennox and Arran ruled for some time without control. On Aug. 12, 1582, however, a party of the nobles seized the king at Ruthven castle; and by authority thus acquired, they imprisoned Arran, and banished Lennox. In 1583 a counterplot restored James to freedom; he immediately restored Arran to power. The confederate lords were obliged to flee to England. In 1585, through the connivance of queen Elizabeth, they returned, and with an army of 10,000 men, obliged James to capitulate in Stirling castle. Arran was again banished. In 1586 queen Mary, then a prisoner in England, was condemned by the English court to be executed. Though James remonstrated strongly, he nevertheless, after his mother's execution, concluded an offensive and defensive alliance with England. In the winter of 1589 James went to Denmark, where he married the princess Anne, daughter of Frederick II., king of that country. From 1591 to 1594 the kingdom was disturbed by various treasonable attempts by the earls of Bothwell, Huntly, and other Roman Catholic lords. It was not till James had marched against Huntly in person that these disturbances were suppressed. Long ecclesiastical disputes followed between king and clergy. In 1600 occurred the Gowrie conspiracy (q.v.). By the death of Elizabeth in 1603, James succeeded to the throne of England. He soon became unpopular with his new subjects. The anger of the Roman Catholics at the severities used towards them was the cause of the famous gunpowder plot (q.v.). The treason was discovered on Nov. 5, 1605. Nor did time increase the popularity of James with any class of his subjects. Weak and good-natured, he impoverished his exchequer to enrich parasites; he degraded the prerogative of the crown by the sale of titles of dignity; the title of baronet, which he

originated, could be bought for £1000, a barony for £5,000, and an earldom for £20,000. A Scotchman of the name of Carr became the royal favorite about the year 1607; honors and emoluments were showered upon him, and in 1613 he was created earl of Somerset. In his turn, Somerset gave place to Buckingham. Under these minions, the name and power of England, so formidable under Elizabeth, sunk to insignificance. In 1617 James revisited Scotland; a visit which his angry disputes with the clergy did not give him much leisure to enjoy. In 1619 his eldest son, Henry prince of Wales, died, to the great grief of the nation. James had set his heart upon effecting a marriage between his son Charles (now prince of Wales) and a Spanish princess. For some time, it seemed as if his design would succeed; and in 1623 Charles actually went to the court of Spain, along with Buckingham, to prosecute his suit. Buckingham, however, having quarreled with the leading men of the Spanish court, the negotiation ultimately failed through his pique. A war with Spain was the result. James died March 27, 1625. He was aptly termed by Sully "the wisest fool in Christendom." "He was indeed," says Macaulay, "made up of two men—a witty, well-read scholar, who wrote, disputed, and harangued, and a nervous, driveling idiot who acted." His reign is interesting to the student of English constitutional history, as it was during it that parliament may be said to have taken its first decided stand in its long contest with the crown. The parliament of 1621 is especially memorable on this account.

JAMES II. OF ENGLAND AND VII. OF SCOTLAND (1685-88), son of Charles I. and Henrietta Maria, was b. Oct. 15, 1633. In 1643 he was created duke of York. In 1648, during the civil war, he made his escape to France. For some time he served in the French army under Turenne; but on peace being made with Cromwell, he was obliged to leave both the army and territory of Louis XIV. He then entered into the military service of Spain. At the restoration he was made lord high admiral of England, twice commanding the English fleet in the ensuing wars with the Dutch. In 1660 he married Anne, daughter of lord chancellor Hyde. On the death of the duchess of York in 1671, James avowed his conversion to popery. On the passing of the test act in 1673 he was obliged to resign office. On Nov. 21, 1673, he married Mary Beatrice, daughter of the duke of Modena. During the great irritation against the Roman Catholics which arose in England on the publication of Titus Oates's supposed discoveries, the duke of York resided for a short while on the continent. The bill for his exclusion from the throne was twice read before the house of commons, and only prevented from passing by the prorogation of parliament, May 26, 1679. In 1680 the exclusion bill passed in the house of commons, but was rejected in the house of lords. On his return from abroad, and while the exclusion bill was before parliament, the duke was sent down to govern Scotland. On the death of Charles II., Feb. 6, 1685, James succeeded to the crown without opposition. He had scarcely been many hours a king when he violated the fundamental laws of the constitution by continuing the levy of customs, settled on the late king for life only, without the authority of parliament. At war with his parliament, in order to obtain money, James was forced to become the pensioner of Louis XIV. In passion week 1685, the rites of the church of Rome were openly celebrated at Westminster with full splendor. In the same year, the suppression of the duke of Monmouth's rebellion in England, and that of the earl of Argyle in Scotland, was followed by great severities. On the western circuit alone, well known as the bloody assize, presided over by the infamous Jeffreys, 320 persons were hanged. On the meeting of parliament Nov. 9, of this year, James requested extra supplies to maintain a standing army, which was a favorite scheme of his. He noticed in his speech, that in some recent appointments he had thought fit to dispense with the test act. After a stormy debate, government was finally beaten on the question of supply. To aid his endeavors in favor of the Roman Catholics, James resolved to try to conciliate the Puritans, much as he hated them. On April 4, 1687, appeared the memorable declaration of indulgence, in which he announced his intention of protecting dissenters in the free exercise of their religion; and the nation beheld the extraordinary spectacle of the house of Stuart leagued with republican and regicide sects against the old cavaliers of England. The attempt to conciliate the Puritans was, however, unsuccessful; and in March, 1687, it began to be evident that the war between king and church must soon reach a climax. At that time, a vacancy having occurred in the presidency of Magdalen college, Oxford, a royal letter came down recommending Anthony Farmer, a Roman Catholic, to the vacant place. For Farmer was afterwards substituted Parker, bishop of Oxford. He was known to be a Roman Catholic, though not avowed; besides which, he labored under other legal disqualifications. The fellows of the college declined to elect him. A special ecclesiastical commission was then sent to Oxford, escorted by three troops of cavalry with drawn swords. Parker was installed, the fellows expelled, and declared forever incapable of holding any church preferment. On April 27, 1688, James published a second declaration of indulgence; this he ordered to be read in all the churches in the kingdom. The order was generally disobeyed by the clergy, and seven of the bishops having ventured on a written remonstrance, were committed to the Tower on a charge of seditious libel. On June 10 of the same year, James's luckless son, known in history as *The Pretender*, was born. The history of the trial and acquittal of the seven bishops on June 29, 1688, forms one of the most glowing passages in the splendid narrative of Macaulay. On the

night of the same day, an invitation was dispatched to William, prince of Orange, signed by seven of the leading English politicians, to come over to England and occupy the throne. On Nov. 5 William landed at Torbay with 14,000 men. James found himself deserted by the nobility, gentry, and army; even his own children turned against him. He retired to France, where he was hospitably received by Louis XIV., who settled a revenue upon him. Early in March in the following year he made a hopeless attempt to regain his throne by invading Ireland with a small army, with which he had been furnished by the king of France; he was totally defeated at the battle of the Boyne, July 1, 1690. He returned to France, continuing to reside at St. Germain's till his death, Sept. 6, 1701. There is hardly a sovereign mentioned in history of whom one can find less good to say than of James II.

JAMES I., King of Scotland (1406-37), was the second son of Robert III., by Annabella Drummond, daughter of sir John Drummond of Stobhall. His elder brother, the duke of Rothesay, having been murdered by his uncle, the duke of Albany, James became heir to the throne. Fearing that he also might be sacrificed to the unscrupulous ambition of Albany, his father resolved to send him to France. Accordingly, in 1405, he set sail for that country, but he never reached it; the vessel in which he was embarked having been taken by the English. James himself was carried to London, and sent to the Tower. In 1407 he was removed to Nottingham castle. In 1417 he accompanied Henry V. in his expedition to France. On the death of Robert III., in 1406, the government devolved on the duke of Albany. On his death, in 1419, his son Murdoch succeeded to the regency. In 1424 James's long captivity came to an end: on giving hostages for payment of £40,000 he was allowed to return to his kingdom. Previous to leaving England he married Joanna, daughter of the earl of Somerset, fourth son of John of Gaunt. To the excellent education which he had received in England, James was indebted for the development of his very considerable powers of mind. His poems, *Christ's Kirk on the Green* (the authorship of which, however, is disputed), and *King's Quhair*, show him to have been possessed of high poetic talent. With the acts of his first parliament, in 1424, the regular series of Scotch statutes may be said to begin. Many excellent laws were passed for the regulation of trade, and for the internal economy of the kingdom; while these were followed up by an executive vigor which Scotland had never known before. No sooner did James feel himself firmly seated on the throne than he resolved to execute vengeance on the Albany family. By a parliament held at Perth in 1425 the two sons of the late regent Murdoch, and his father-in-law, the earl of Lennox, were found guilty of certain crimes laid to their charge, and immediately beheaded. The next few years of James's reign are among the most really peaceful in the history of Scotland previous to the union of the crowns; the whole efforts of the king being directed to the repression of the internal disorders of the kingdom; especially of the Highlands, where scarcely any law except that of the strongest had hitherto been known. In 1436 James's eldest daughter, Margaret, was married to the dauphin of France, afterwards Louis XI. Amongst those whom the wisely severe policy of the king had offended was sir Robert Graham, uncle of the earl of Strathearn. He had been imprisoned in 1425, on the impeachment of the Albany family. Owing to this cause, or to some real or imaginary injury done to his family, Graham was so irritated that in 1435 he actually used treasonable language to the king himself when presiding in parliament. For this he was banished, and his possessions declared forfeited. He retired to the Highlands, to brood over a plan of revenge, which circumstances soon put it into his power to execute. In 1437 the court held the Christmas festival at Perth. The king was about to retire for the night, when the sound of men in armor was heard outside the gates. It was Graham, accompanied by 300 armed men. The locks of the chamber-door having been purposely spoiled, Catherine Douglas, with a spirit worthy of her name, thrust her arm into the staple, to make it serve the purpose of a bar; but her arm was broken, and the ruffians entered the chamber. The king, who had hidden himself in an aperture under the floor, was discovered, dragged out, and cruelly murdered, in the 44th year of his age. Graham and the other ringleaders were afterwards seized, tortured, and put to death. James was unquestionably the most able of the Stuart family. Both his intellectual and practical ability were of a very high order.

JAMES II., King of Scotland (1437-60), was the son of James I. and queen Joanna, and was b. in 1430. He was crowned at Edinburgh when only in the sixth year of his age. Sir William Crichton, the chancellor, and sir Alexander Livingston, contrived to keep possession of the person of the young king, and consequently to wield the royal authority until he had reached his fourteenth year. The power of the house of Douglas had now risen to so great a height as almost to overshadow that of the crown. In the hope of curbing it, Crichton had treacherously caused William, the young earl, and his brother to be put to death. The policy of the act proved to be as bad as its spirit, for by the marriage of the heiress of the murdered youth with her cousin, the family was restored to more than its former power. The young king, tired of the rule of Crichton, put himself under the control of Douglas. A parliament was held, by which Crichton and Livingston were declared rebels, and their estates forfeited. Under the rule of the earl, the kingdom fell into complete anarchy, and became one scene of violence and disorder. Douglas, however, maintained the warlike renown of his house; in 1448 the

English having invaded Scotland, he gave them battle on the banks of the little river Sark, in Annandale, and defeated them with very considerable slaughter. In 1449 James married Mary, daughter of Arnold, duke of Gelderland. The character of the king appears to have been much strengthened after his marriage. Like most of the Stuarts, he possessed great animal courage; he seems also to have possessed much of his father's clearness of perception in framing laws, and of his energy in enforcing their observation. Chafing under the sway of Douglas, he resolved to assert his independence. Crichton, who had previously contrived to make terms for himself, was constituted the royal adviser. Douglas, driven from power, formed an alliance with the earl of Crawford. By the union of these two powerful nobles, it seemed that the royal authority in Scotland had virtually become extinct. James had recourse to treachery; he invited Douglas to visit him at Stirling castle, where, picking a quarrel with him, he murdered the earl with his own hand. But the power of the Douglas family was not yet broken. Through the aid of the house of York, then dominant in England, and by the martial influence of his name, the heir of the murdered earl was enabled to raise the standard of rebellion at the head of an army of 40,000 men. But James, listening to the wise advice of his councilor Kennedy, soon succeeded in quelling this insurrection. Douglas was compelled to flee; and his lands were granted to the earl of Angus. In 1460, from causes not clearly known, James infringed an existing truce with England, by laying siege to the castle of Roxburgh, then in the hands of the English. While he was standing beside one of the rudely made caonons of that time, the gun burst, and a fragment striking him, produced almost immediate death. He died in the 29th year of his age, and 24th of his reign.

JAMES III., King of Scotland (1460–88), was the son of James II. and Mary of Gelderland, and was b. in 1453. On the death of his father, the government appears to have been conducted by his mother, guided by the wisdom of bishop Kennedy. On the death of the latter in 1465, the young king fell into the hands of lord Boyd and his family. In 1467 so great influence had they acquired that James gave his sister in marriage to sir Thomas Boyd, son of lord Robert, sir Thomas being at the same time created earl of Arran. On the king's marriage, however, in 1469, with Margaret of Denmark, power changed hands: lord Boyd was obliged to flee, and even Arran was driven into exile; in which condition he died. In 1474 his widow married lord Hamilton; of which marriage were born James, created earl of Arran in 1503, and Elizabeth, who married Matthew, earl of Lennox. James was all his life under the influence of favorites. Conspicuous among these was a man named Cochran, originally a mason. Through his means the duke of Albany, brother of James, was forced to flee from the kingdom, having been charged with witchcraft; while the earl of Mar, also a brother of the king, was actually put to death on the same absurd accusation. The rule of Cochran and other low-born favorites became intolerable to the haughty Scotch nobility. Disputes having arisen with England, and an English force having advanced on Berwick, James put himself at the head of an army to oppose the invaders. Angus, Crawford, Argyle, and others resolved to profit by this opportunity to rid themselves of the obnoxious favorite. They met in council to deliberate upon their plans. It was on this occasion that Angus acquired his well-known sobriquet of "Bell the Cat." The result was that Cochran and five other of the leading favorites were seized and summarily hanged. The king himself was imprisoned within the castle of Edinburgh. The banished duke of Albany had joined the English army. On a treaty being made, he was, by some unknown means, restored to his brother's favor. He did not long hold it, however. In 1487 Margaret of Denmark died. James's love of pursuits which, for the age in which he lived, were intellectual, brought upon him the contempt of a warlike and illiterate nobility—a contempt on which the weakness of his moral character imposed no check. A conspiracy, whose origin is obscure, ended in a rebellion, having for its avowed object the dethronement of the king. Many of the peers, however, remained loyal, so that James was enabled to put himself at the head of a considerable force. But, mainly through the cowardice of the king, the royal army was defeated at Sauchie, June 18, 1488. James escaped from the field; but he was afterwards discovered by one of the rebels, and murdered. He died at the age of 36.

JAMES IV., King of Scotland (1488–1513), was the son of James III. and Margaret of Denmark, and was b. March 17, 1472. A movement, headed by the earl of Lennox, having for its object the subversion of the new government, was soon quelled; and the rule of the young king gave promise of being both vigorous and popular. The avarice of the preceding reign was followed by a profusion which conciliated the nobles; while the king's personal beauty and open manner won the hearts of the people. The naval exploits of sir Andrew Wood of Largo, in the beginning of this reign, are worthy of note. With a greatly inferior force he twice defeated the English; on one occasion capturing as many as five of their ships of war. Instead of avenging this defeat by force of arms, Henry VII., then reigning in England, wisely resolved to endeavor to win Scotland by conciliation and policy. He proposed a marriage between James and his daughter Margaret; but his wise schemes were for a long time frustrated by the gold and intrigue of the king of France. But at length the prudence of Henry prevailed, and in 1503 James married Margaret of England. By a treaty then entered into between

England and Scotland, the first peace since 1332 was established between the two countries. The king of England saw what none of his predecessors had been able to see—that he could easily gain by policy what it was hopeless to attempt to seize by force. Had he lived longer, a lasting amity might have been established between the two countries; but his son and successor was even hotter and more headstrong than James himself. The English treaty was followed by a period of almost unexampled peace and prosperity; but by the death of Henry VII., in 1509, all this fair prospect was destroyed. It was not, however, until Henry VIII. had been two years on the throne that a rupture took place between the two kings. James had demanded reparation for an alleged outrage on the Scottish flag; Henry had returned a contemptuous answer. He had further irritated the Scotch king by countenancing certain English border chieftains who had been accessory to the murder of sir Robert Ker; he had also declined to deliver a legacy of jewels bequeathed to queen Margaret by her father. Long and angry negotiations followed, which ended in James's rash and fatal invasion of England in the summer of 1513. The disastrous battle of Flodden (q.v.) was fought Sept. 9 of that year. The body of James was found on the field after the battle. He died in the 41st year of his age, and 26th of his reign.

JAMES V., King of Scotland (1513–42); was the son of James IV. and Margaret of England. He was b. at Linlithgow, April 10, 1512. The period of his long minority is one of the gloomiest in Scottish history. Such was the lawless state of the country that it was impossible to pass from one place to another except in armed companies. The duke of Albany was chosen regent by the parliament, but his government was almost powerless, owing chiefly to the jealousy and enmity of the earl of Angus, who had married the queen-mother. Ultimately Angus prevailed, and the duke retired to France. For a while the Angus branch of the Douglas family ruled Scotland in the same manner as the elder branch had ruled it in the beginning of the reign of James II. When in his seventeenth year, the king, resolved no longer to brook the authority of the earl, escaped from his custody. Angus and his family were banished and their estates declared forfeited. In 1536 James visited the court of France; and Jan. 1, 1537, he was married to Magdalen, daughter of Francis I. This amiable queen lived for but a few weeks; and in the same year James was again married. His second wife was Mary of Lorraine, daughter of the duke of Guise. Henry VIII. having declared his independence of the pope, became desirous that his nephew should follow his example; but James remained true to his ancestral faith. The king had two sons by Mary of Guise, but they both died in infancy, within a few days of each other—an event which seems to have greatly affected the mind of James. With the view of gaining his nephew over to his ecclesiastical views, Henry proposed that they should have an interview at York. He actually went to that city, and remained in it for six days, expecting the arrival of James, who never came. This piece of real or fancied neglect greatly enraged Henry. In 1542, the English having made an incursion across the border, were attacked and defeated with great loss by the earls of Huntly and Home. To avenge this defeat Henry sent the duke of Norfolk into Scotland with an army of 20,000 men.

Negotiations for peace having failed, James raised an army of 30,000 men to oppose Norfolk. The spread of the reformation had now begun to divide the kingdom, the nobles being mostly on the reformed side, while the king sided with the clergy. When the Scottish army had reached Fala, news arrived of Norfolk's retreat. The nobles, actuated either by disloyalty, or by thoughts of Flodden, declined to follow the king in an invasion of England, upon which he was bent. While this controversy was pending between James and the nobles, a report arose that Oliver Sinclair, a royal favorite, had been appointed to the chief command. The army became a scene of tumult and disorder. While in this disorganized state it was attacked by Dacre and Musgrave, two English leaders, at the head of 300 men. The Scotch were utterly routed. This dishonor to his arms seems quite to have broken the heart of James. He shut himself up in Falkland palace, where he died, Dec. 13, 1542, seven days after the birth of his unfortunate daughter Mary, in the 31st year of his age, and 30th of his reign.

JAMES VI. of Scotland. See **JAMES I.** of England, *ante*.

JAMES VII. of Scotland. See **JAMES II.** of England, *ante*.

JAMES, GEORGE PAYNE RAINSFORD, a fecund and popular novelist, was b. in London in 1801, and commenced the career of authorship at an early age. Before he reached the age of 17, he wrote seven eastern tales, entitled *The String of Pearls*; but the first work that bore the author's name was *Richelieu*, which appeared in 1825. From this period till his death, which happened June 9, 1860, in Venice, where he held (since 1858) the office of British consul, his publications were, we might almost say, incessant. The principal are *Durnley*; *De L'Orme*; *Philip Augustus*; *Henry Master-ton*; and *Mary of Burgundy*. He also composed some poetry, and several historical works of a biographical kind, such as *Charlemagne*; *The Black Prince*; and *Richard Cœur de Lion*. James's writings are cheerful and pleasant in spirit, but his notions of the romantic, whether in scenery or character, are entirely conventional, and are apt to make quick-witted readers smile at the juvenility of the author's fancy.

JAMES, HENRY, b. Albany, 1811; pursued his studies at Union college and afterwards at Princeton. During his travels in Europe he became interested in the views promulgated by Robert Sandeman, whose work, *Letters on Theron and Aspasia*, he had edited for the American press. His religious views were peculiar, in that while he denied the doctrine of the Trinity he advocated belief in the deity of Christ. He made the acquaintance of Swedenborg, whose writings exercised a potent influence over his mind. In 1849 he delivered a series of lectures in New York, on *Moralism and Christianity*, which he afterwards collected and published in book form. In 1852 he delivered a second course of lectures, all of them inculcating the same views, namely the intrinsic difference between morality and religion in their relation to human existence. Among his works are *Lectures and Miscellanies*; *The Church of Christ not an Ecclesiasticism*; *The Nature of Evil*; *Christianity the Logic of Creation*; *Substance and Shadow*; and *The Secret of Swedenborg*.

JAMES, SIR HENRY, 1803-77; b. England; educated at Woolwich, and entered the engineering service of the government. He superintended a geological survey of Ireland in 1844, and the construction of the important works at Portsmouth two years later. In 1852 he was appointed chief of the ordnance survey, which office, with that of chief of the topographical and statistical departments of the ministry, he continued to hold until his death. He devoted much study to the subject of photographic printing, and devised a process which he called photozincography, a description of which he published in 1862. By this process he produced in fac-simile the *Domesday Book*, in 32 vols., and *National Manuscripts from William I. to Queen Anne*. He also prepared the *Ordnance Survey*, in Ireland, Scotland, and England and Wales; and wrote *Account of the Principal Triangulation of the United Kingdom*, and *Record of the Expedition to Abyssinia*.

JAMES, HENRY, JR., b. N. Y., 1843; son of the rev. Henry James, a Swedenborgian minister, formerly lived in Cambridge, Mass., though not a Harvard graduate. For some years he has resided in London. He commenced the career of a writer by contributing fiction to *The Galaxy*, a magazine formerly published in New York, afterwards consolidated with *Scribner's Monthly*. He contributed his first novel, *Watch and Ward*, to the pages of the *Atlantic Monthly*; and has since published *The Europeans*; *The American*; *Daisy Miller*; *An International Episode*; *The Diary of a Man of Fifty*; *Washington Square*; *A Bundle of Letters*, and other works of fiction; also *Transatlantic Sketches*, a volume of travels; *French Poets and Novelists*, in the nature of criticism; and *Hawthorne*, one of the series entitled *English Men of Letters*. His writings show careful training and delicate literary workmanship, and have had wide circulation; but with their undeniable excellencies, they have been criticised for lack of balance and perspective in characterization. In beauty and aptness of diction he is scarcely exceeded.

JAMES, JOHN ANGELL, an eminent Congregationalist minister, was b. at Blandford, Dorsetshire, June 6, 1785, studied for a short time at a dissenting college at Gosport, and was placed on the "preaching list" at 17. He was highly popular, and when only 20 was settled as pastor of the "church meeting in Carr's lane," Birmingham, where he remained till his death, Oct. 1, 1859. In the course of years, Angell James came to be considered the most important and influential public man in connection with his own denomination, and on account of his "evangelical" views of religion, he was also much esteemed both by the low-church party in the English establishment, and by dissenters generally in Scotland and America. He published a multitude of sermons, tracts, addresses, and small religious volumes (the best known being the *Anxious Inquirer*), which had—and some of them still have—a vast circulation.—See Dale's *Life and Letters of John Angell James* (Lond. 1862).

JAMES, THOMAS, an English explorer. In 1631 he undertook the search for the n.w. passage at the instance of a company of London merchants, and was accompanied by Luke Fox, the originator of the scheme. Leaving Deptford May 5, they reached Hudson's bay June 22, and proceeded northward until Aug., 1632, when they found their passage blocked by ice in $65\frac{1}{2}$ ° n. lat. He named the southern portion of Hudson bay James's bay, and discovering land to the w., called it New Wales. Returning to London he published *The Strange and Dangerous Voyage of Captain Thomas James in the Northern Seas, for the Discovery of a North-west Passage to the South Sea*.

JAMES CITY, a co. in s.e. Virginia, bounded by three rivers, the James, the York, and the Chickahominy; 184 sq.m.; pop. '70, 4,425—2,440 colored. Its chief productions are wheat, corn, oats, sweet potatoes, and butter. Co. seat, Williamsburg.

JAMES, EPISTLE OF (see James, *ante*), is strongly attested as genuine by being in the Syriac version of the New Testament, made about the close of the 1st c. and in use near the region where the apostle James and his first readers lived. There are probable allusions also to it in the writings of Clement, who, about the same time, was bishop of Rome, and in those of Hermes of the 2d century. Origen, in the 3d c., and Athanasius in the 4th, quote it as genuine. Eusebius, in the 4th, classes it among the writings not unanimously received; says that some even regarded it as spurious, yet testifies that it was used by most of the churches; and in other passages, quoting it without hesitation, he speaks of it as Scripture, and of its author as the holy apostle. Jerome, in the same century, says that James wrote an epistle, which some regarded as the work of another person who

had appended to it the apostle's name, but that gradually, as time advanced, its authority was established. When, in 397, the council of Carthage acknowledged it as canonical, it had become almost universally acceptable to the churches both of the east and the west. At the reformation, Luther at first, in the ardor of his zeal for the doctrine of justification by faith, misapprehending the epistle as though it contradicted the teachings of Paul, called it "strawy;" but afterwards in his mature judgment, perceiving that the contradiction was only apparent, he acknowledged its authority. The appearance of contradiction between Paul and James, on which so much stress has been laid, results from disregarding the different points at which their views of faith and works were taken. Paul first speaks of Abraham in his unrenewed state; James speaks of him after his experience of divine grace: Paul describes justification as the act of God; James looks on it as manifested to men: Paul declares that works wrought without faith are insufficient to procure it; James affirms that works wrought in faith are necessary to manifest it: Paul looks at Abraham's faith when first exercised and as known to God; James regards it after it had had its ultimation in works that were visible to men. In other passages of Paul's writings, where his point of view is the same as that of James, he agrees perfectly with him, declaring it impossible that genuine faith should be without the fruit of good works, and bringing forward the works of Abraham and Rahab as the fruits of their faith, precisely as James does.

Analysis.—Part I. chap. i. exhorts Christians to practice joyful patience under trials; to seek wisdom from God with unwavering faith; to rejoice in poverty, because of the exaltation which the gospel confers; and in wealth, because of the discipline which it supplies; to remember that God is the author of nothing evil, but of everything good; to receive the word of God promptly and humbly, reducing it to practice, and under its guidance, persevering in a benevolent and pure life. Part II. (ii.—v. 6) censures the exhibition, in Christian assemblies, of greater respect for the rich than for the poor; declares that all profession of faith, however confident, which does not lead to good works is only a pretense which cannot justify a sinner; denounces ungoverned and malevolent speech as a source of great evils and in glaring contrast to the pure and peaceful wisdom which, coming from above, manifests itself in benevolent words and deeds; and condemns strife, immorality, pride, reckless pursuit of pecuniary gain, oppression of the poor, and luxurious living, as bringing the punitive judgment of God. Part III. (v. 7-20) exhorts again to patient waiting for the coming of the Lord, encouraged by the remembrance of the prophets and especially of Job; to reverent and careful speech; to confession and prayer, commended by the example of Elijah who, with a nature like that of other men, obtained signal answers to his prayers; and to zealous efforts for the conversion of transgressors, animated by the joyful hope of saving souls from death.

JAMES FRANCIS EDWARD STEWART. See STEWART, THE FAMILY OF, ante.

JAMES ISLAND, one of the sea-island chain, famous for cotton, lies immediately s. of the Ashley river and the city of Charleston, S. C.; pop. 1808. Here, as was the case with all the islands in Charleston harbor, occurred many important incidents of the war of the rebellion.

JAMESON, Mrs. ANNA, an English authoress, b. in Dublin, May 19, 1797. She was the daughter of Mr. Murphy, a painter, and was married in 1827 to a Mr. Jameson, a barrister, but soon after separated from her husband, and devoted herself to literature. She died March 17, 1860. Her principal works are: *Diary of an Ennuyée* (1826); *Lives of the Poets* (1829); *Characteristics of Shakespeare's Women* (1832); *Memoirs of the Early Italian Painters*, etc. (1845); *Sacred and Legendary Art* (1848); *Legends of the Monastic Orders* (1850); *Legends of the Madonna* (1852); *Commonplace Book of Thoughts, Memories, Fancies* (1854); and *The Scriptural and Legendary History of our Lord*, etc., as represented in *Christian Art* (1860).

In all her writings, Mrs. Jameson evinces a fine fancy, a delicate, womanly perception of the beautiful, and a genuine poetic enthusiasm. The *Memoirs of the Life of Mrs. Jameson* appeared in 1878.

JAMESON, or JAMESONE, GEORGE, an eminent Scotch portrait-painter, called by Walpole *the Van Dyck of Scotland*, was born at Aberdeen in 1586. Of his early history nothing is known. He was at Antwerp in 1616, studying under Rubens, had Van Dyck as a fellow-pupil, and returned to Scotland in 1628. He was first patronized by sir Coii Campbell of Glenorchy, for whom he painted many portraits of the kings and queens of Scotland; among others, "Robert Bruce" and "David Bruce." His great talents being at once acknowledged, he was largely patronized by the nobility, and in 1633 Charles I. sat to him. He died at Edinburgh in 1644. Though the pupil of Rubens and associate of Van Dyck, his productions bear very little resemblance to those of either of these great masters; distinguished for their clearness of outline, delicacy and softness of shading, and beauty of color, they have neither the richness of the former nor the vigor of the latter. Though celebrated only as a portrait-painter, he has left numerous historical, miniature, and landscape pieces. His productions are very numerous; the largest collection of them is in the possession of the earl of Breadalbane, and many others of the Scotch nobility possess paintings by him; there are also several in the halls of the university of Aberdeen.

JAMESON, ROBERT, distinguished as a naturalist, was b. at Leith, July 11, 1774, and d. in Edinburgh, April 28, 1854. Although originally intended for the medical profession, Jameson's strongly-manifested love for the study of animals and plants early led him to devote himself to various branches of natural history. After having given evidence of considerable ability and indefatigable industry in various able memoirs, he went in 1800 to Freyberg, to study under Werner. He was elected in 1804 to the chair of natural history in the university of Edinburgh; and during the term of his professorship, numbered among his students many of the best naturalists of the present day. In 1808 he founded the Wernerian society of Edinburgh; and in 1809 brought out his *Elements of Geognosy*, in which he gave a comprehensive exposition of the Neptunian theory as it had been modified by Werner. In 1819 he founded, in concert with sir David Brewster, the *Edinburgh Philosophical Journal*, and in 1826 the *Edinburgh New Philosophical Journal*, of which he continued to be the editor till his death. His principal works, in addition to those we have already mentioned, are *A System of Mineralogy* (1804); *A Mineralogical Description of the County of Dumbarton* (1805), which was intended to have been the first of a series of similar works on all the counties of Scotland; *Manual of Minerals and Mountain Rocks*, etc. (1821); and *Elements of Mineralogy* (1837). The natural history museum of the university of Edinburgh was largely indebted to the care and skill of Jameson, for besides having carefully arranged its collections, which had been almost created by his own donations and those of a few other scientific men, he obtained, by his representations to government, an annual grant for its maintenance. He was a fellow of almost all the learned societies of Europe.

JAMES RIVER, an important river of North America, formed by the union of the Jackson and Cowpasture streams, rises near the middle of Virginia, and has its entire course in that state. It flows in an e.s.e. direction, passing Lynchburg and Richmond; and widening into an estuary for the last 60 m. of its course, it falls into the Atlantic at the southern extremity of Chesapeake bay. It is 450 m. in length, and is navigable to Richmond, 150 m. from its mouth. Its chief tributaries are the Appomattox on the right, and the Chickahominy on the left bank, made historical by the battles of 1862. It was at Jamestown, 32 m. from the mouth of this river, that the first English settlement in America was formed, 1607. By the James river and Kanawha canal, which extends westward along the upper course of the river, from Richmond to beyond the Blue ridge, the navigation of the James is carried into the center of Virginia.

JAMES, SAINT, LITURGY OF. See LITURGY, ante.

JAMES'S BAY, a southerly arm of Hudson's bay, extends in lat. from 51° to 55° n., and in long. from 79° to $82^{\circ} 30'$ west. It is so beset with islands, that its navigation is more dangerous than that of the other divisions of the same inland sea. Near its southern extremity is situated Moose factory, the most important station, next to York factory, of the Hudson's bay company on the coast.

JAMES'S POWDER is a patent medicine discovered by a Dr. Robert James, who was admitted as a licentiate of the College of Physicians in 1765, and died in 1776, aged 73. The fame that he might otherwise have acquired was tarnished by his patenting his "fever powders," and still more by his falsifying the specification to such an extent as to render it impossible to prepare the powder from his directions. Hence the *compound powder of antimony* has been substituted for it in the British pharmacopœias. From the analysis of the patent medicine, for which one or two London chemists assert that they have the true original prescription, it appears to consist of more than 50 per cent of triphosphate of lime, which must be altogether inert as an antifebrile medicine; of from 35 to 45 per cent of antimonious acid, and a little antimonite of lime and teroxide of antimony. The pharmacopeial preparation very closely resembles it. Both James's powder (prescribed under the title of *pulvis Jacobi veri*) and antimonial powder are very uncertain in their operation, at one time possessing considerable activity, and at another being almost inert. Either may be prescribed in doses of about 5 grains, as a sudorific in fevers and rheumatic affections, and may be given alone, or in combination with a few grains of calomel.

JAMES TOWN, the chief place and only sea-port of St. Helena (q.v.).

JAMESTOWN, a village in New York, United States, 58 m. s.w. of Buffalo, on Chautauqua lake, and near lake Erie. It has a large trade and considerable manufactures. Pop. '70, 5,336.

JAMESTOWN, a village in Chautauqua co., N. Y., at the outlet of Chautauqua lake. It is accessible by the Atlantic and Great Western, and Dunkirk, Allegheny Valley, and Pittsburg railroads. Pop. '70, 5,336. The chief industry is manufacturing, and there are a number of grist and saw mills, obtaining water-power from the outlet. It has 10 churches, and its educational facilities are important. Chautauqua lake is noted for the occurrence of the annual meetings of a number of religious and secular organizations, all of which have grown out of the foundation of the Chautauqua Sunday-school assembly and summer school, established in 1874. The association managing these meetings has erected a number of fine buildings, including a spacious amphitheater, the whole lighted by electricity, and designed and arranged for the accommodation of large numbers of people. Here gather annually, at midsummer, from 8,000

to 10,000 enthusiastic members of different religious organizations, while the Chautauqua literary and scientific circle, designed for the encouragement of home study, has its ramifications extending throughout the entire country. The responsible head of the various institutions here consolidated is rev. J. H. Vincent, of Plainfield, N. J. The grounds occupied by the association cover an area of 4,000 ft. in length by 2,400 wide at the widest part, forming an irregular parallelogram.

JAMESTOWN, the site of the settlement made in Virginia in 1607, the first in the United States by English settlers. At that time it was a promontory extending into the James river; but the action of the water has since made it an island, while the only remains of the original settlement are comprised in the ruins of the church, fort, and a few houses. The colony numbered 107 persons, under Bartholomew Gosnold, Christopher Newport, and the celebrated capt. John Smith; and was recruited in the succeeding years by new accessions, until, in 1619, it was a large and flourishing settlement, with a house of burgesses, the first appearance of an English legislative body in American history. During the Bacon rebellion of 1676, Jamestown was burned, and it was then suffered to remain in ruins. Gen. Wayne and lord Cornwallis fought an engagement here in 1781.

JAMI (ABDERRAHMAN-BEN-AHMED), d. 1492; a Persian poet who is called after the place of his birth, Jami, in Khorassen. His writings are mystical, and he was always in high favor with the sultans of Herat, which was his place of residence. He was the author of many learned works in prose as well as verse, some of which have been preserved and translated into various European languages.

JAMIESON, Rev. JOHN, D.D., a meritorious Scotch scholar, was b. in Glasgow, March 3, 1759, studied for the ministry, and in 1781 was ordained pastor of a congregation at Forfar, in connection with the Antiburgher Secession body. In 1797 he was translated to Edinburgh, where he died July 12, 1838. Jamieson's reputation as a man of letters rests on his *Etymological Dictionary of the Scottish Language* (1808-9), of which he published an abridgment in 1818, and to which he added a supplement in 1825. It is a work of great industry, and very considerable value as a collection of Scotch words, phrases, customs, etc.; but it possesses little critical or philological merit, according to the present standard. His preliminary dissertation on the "Origin of the Scots' Language" is an elaborate but unsuccessful attempt to prove that the Scottish language is really the Pictish language; and that the Picts were not Celts, but Scandinavian Goths. Among Jamieson's other performances may be mentioned, *An Historical Account of the Ancient Culdees of Iona* (1811); *Hermes Scythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic* (1814); *An Historical Account of the Royal Palaces of Scotland*; an edition of Barbour's poem, *The Bruce* (1820); and Blind Harry's *Sir William Wallace*.

JAMIESON, JOHN, D.D. (*ante*), 1759-1838; b. Scotland. He took orders, and for some time officiated as minister in Forfar in connection with the Secession church. The latter half of his life was passed at Edinburgh, where he fulfilled the duties of his profession and wrote several able essays, amongst others, *Alarm to Great Britain, or an Inquiry into the Causes of the Rapid Progress of Infidelity; Vindication of the Doctrine of Scripture*, a reply to Dr. Priestly's *History of Early Opinions*. His most valuable works, however, were his *Etymological Dictionary of the Scottish Language*; and *Hermes Scythicus*, a treatise in which he traced the radical affinities of the Greek and Latin languages with the Gothic.

JAMROSADE. See EUGENIA.

JAMU', a t. and fort in the n. of the Punjab, is in lat. $32^{\circ} 44'$ n., and long. $74^{\circ} 54'$ east. It stands, amid the more southerly mountains of the Himalayas, on both banks of an affluent of the Chenab, the town on the right side, and the fort on the left. It contains 8,000 inhabitants.

JANAUSCHEK, FANNY, b. Prague, Bohemia, 1830. She was devoted to the stage from childhood, and in her earliest years gave evidences of artistic talent. Her career as an actress began with much success at Cologne. From 1848 to 1860 she appeared in the principal cities of Germany. In 1867 she came to the United States, playing in New York and other cities, but exclusively in the German language. She was greatly pleased with the country, and determined to play here in English, which she did during the season of 1873-74, and in later years. She is an actress of great power, but lacks the finer touches of her art. She returned to Europe in 1878.

JANES, EDMUND STONER, D.D., 1807-76; b. Mass.; was educated in Conn., and studied for the bar, but became a Methodist itinerant minister, receiving his appointment at the Philadelphia conference of 1830. He advanced with great rapidity, preaching in Philadelphia and New York, and in 1840 became financial secretary of the American Bible society. In 1844 he was elected a bishop of the Methodist Episcopal church. At the time of his death Dr. Janes was the senior bishop of his church.

JANESVILLE, a city in Wisconsin, United States of America, on both sides of Rock river, 45 m. s.s.e. of Madison. It is built partly on a plain by the river, and partly on a bluff 100 ft. above it, where the public buildings are seen to great advantage. It is

connected with Chicago, Milwaukee, and the towns on the Mississippi by intersecting railways. There is a large water-power for many mills and factories, and a state asylum for the blind. Founded in 1836, it had, in 1870, a pop. of 8,789.

JANESVILLE (*ante*), a city in Rock co., Wis., 70 m. s.w. of Milwaukee; pop. '70, 8,789; deals extensively in horse-breeding and trading. It has large manufactories and public schools. It has excellent water power, owing to its situation on both sides of the Rock river. The state institute for the blind is situated here, the press is represented by a number of important publications, and particular attention is paid to the cultivation of musical taste and skill, for which there are several special schools.

JANET, PAUL, b. Paris, 1823; a prolific and learned writer. He was for some time lecturer on philosophy at Bourges and Strasburg, and became professor of the history of philosophy at the Sorbonne, 1864. He represents the modern French philosophic school, advocating the principles of Cousin, and promoting the freedom of examination demanded by the most recent psychologists.

JANIN, JULES GABRIEL, a very clever French critic, was born at St. Etienne, in the department of Loire, Dec. 11, 1804, studied at the college *Louis-le-Grand* in Paris, and addicted himself to journalism at an early period. His wonderful piquancy of style, his airy grace of sentiment and wit, and his dashing paradoxes of criticism, were greatly relished by his countrymen; so much so, indeed, that Janin, without fear of ridicule, was able to dub himself *le Prince de la Critique*. For many years he made and destroyed literary reputations in the columns of the *Journal des Débats*. He also wrote a good many novels, tales, narratives of tours, etc., among which may be mentioned *L'Ane mort et la jeune Femme guillotinée*; *Contes fantastiques*; *Contes nouveaux*; *Voyage de Victor Ogier en Orient*; *Les Catacombs*; *La Bretagne historique*, etc.; *Voyage de Paris à la Mer*; and *Les Symphonies de l'Hiver*. He was made a member of the French academy in 1870, and died in June, 1874.

JANINA, a city of Turkey, capital of a vilayet, is situated on the s.w. bank of the lake of Janina, in the part of the ancient Epirus which after the war of 1877 Turkey was pressed to cede to Greece. The lake of Janina, called by the ancients *Pambotis*, consists of two portions connected by two channels. Its extreme length is about 12 m., its greatest breadth about 3 miles. At its southern end, stood the ancient city of Dodona. The city of Janina stands in the midst of an extensive and fertile plain, which produces fruits and grain in abundance. Its chief buildings are 19 mosques, 6 Greek churches, a Greek college, and 2 synagogues. Gold brocade is here extensively manufactured by Greek workmen, as well as gold lace for the east, morocco leather, silk goods, and colored linen. Janina was long the head-quarters of the gifted but unscrupulous Ali Pasha (q.v.). It is now in part deserted; its pop., which was 40,000 under Ali Pasha, is now 25,000 (of whom 15,000 are Greeks).

JANIZARIES (*Jeni-tsheri*, new soldiers), a Turkish military force, originally formed by the Osmanli sultan Orkhan, about 1330, of young Christian prisoners compelled to embrace Mohammedanism; and more perfectly organized by sultan Amurath I. after 1362, when the number was raised to about 10,000, and especial privileges were conferred on them. They were for some time recruited from Christian prisoners, but their privileges soon induced many young Turks to seek admission into their body. There were two classes of janizaries, one regularly organized, dwelling in barracks in Constantinople and a few other towns, and whose number at one time amounted to 60,000, but was afterwards reduced to 25,000; and the other composed of irregular troops, called *jamaks*, scattered throughout all the towns of the empire, and amounting in number to 300,000 or 400,000. At the head of the whole janizary force was the *aga* of the janizaries, whose power was limited only by the danger of revolt, and extended to life and death. The janizaries were always ready to break out into deeds of violence if their pay or perquisites were withheld. In times of peace they acted as a police force. They served on foot; generally formed the reserve of the Turkish army, and were noted for the wild impetuosity of their attack. The sultan's body-guard was formed of them. The janizaries, however, soon began to be very unruly; and their history abounds in conspiracies, assassinations of sultans, viziers, agas, etc., and atrocities of every kind; so that, by degrees, they became more dangerous to the sultans than any foreign enemies. The attempts of the sultans to reform or dissolve them were always unsuccessful, till sultan Mahmoud II., in 1826, being opposed in some of his measures by the janizaries in Constantinople, displayed the flag of the prophet, and succeeded in arousing on his own behalf the fanatical zeal of other portions of his troops. The janizaries, deserted by their aga and other principal officers, who remained faithful to the sultan, were defeated and their barracks burned, when 8,000 of them perished in the flames. A proclamation of June 17, 1826, declared the janizary force forever dissolved. All opposition was defeated with bloodshed. Not fewer than 15,000 were executed, and more than 20,000 were banished.

JANKOVACZ, a t. of the Austrian empire, in the co. of Baes, 81 m. s.s.e. from Pesth. The surrounding country is level and fertile. Pop. '69, 7,890.

JAN MAY'EN'S LAND, an island in the Arctic ocean, named after a Dutch navigator, by whom it was discovered in 1611. It lies between Iceland and Spitzbergen, and is

the northernmost known volcanic land. Its highest point is the volcano of Beerenberg, 6,640 ft. high, a conical, snow-covered mountain, from which flames and smoke have been seen to proceed, and the sides of which exhibit immense glaciers and frozen waterfalls. Another volcano, called Esk, about 1500 ft. high, was discovered by Scoresby in 1817. An interesting account of the island is to be found in lord Dufferin's *Letters from High Latitudes*.

JANOW, MATTHIAS VON, d. 1394; son of a Bohemian knight and one of the most distinguished reformers before the reformation. Of his early history little is known. He was educated at the university of Prague, and spent six years at the university of Paris. When quite young he was celebrated for his theological learning. Visiting Rome he was appointed in 1381 prebendary at Prague and confessor of Charles II., continuing to perform the duties of the office until his death. Though not an eloquent preacher, he was a man of spiritual power, and by his writings did much to purify the church from its corruptions. His works contain the germ of those Christian principles which were unfolded by Huss, and later in Germany by Luther. In his book *De regulis Veteris et Novi Testamenti*, he portrays the corruption of the church in all its parts, and explains the causes of it. He tries everything by the divine word, rejecting the authority of human tradition and papal decretals, and severely arraigning the conduct of bishops and priests. His writings show that he took higher ground than Waldhausen and Milicz, the forerunners of Huss, and that he was in fact the Wyeliffe of the Bohemian church. The pope declared him guilty of heretical teaching, and he was compelled to leave Prague. In 1410, 16 years after his death, his writings were burned with those of Wycliffe.

JANSEN, CORNELIUS, a celebrated divine, b. of humble parentage in 1585, at Akkoi, near Leerdam, in Holland, from whom the sect of Jansenists derives its name. He was nephew of the well-known biblical commentator, and bishop of Ghent, of the same name. The studies of Jansen were divided between Utrecht, Louvain, and Paris. Having obtained a professorship at Bayonne, he devoted himself with all his energy to scriptural and patristic studies, especially of the works of St. Augustine. From Bayonne, he returned to Louvain, where, in 1617, he obtained the degree of doctor, was appointed lecturer on Scripture, and took a prominent part in the affairs of the university, especially in a contest with the Jesuits, on occasion of which he was sent upon a mission to the court of Madrid. In 1630 he was appointed to the professorship of Scripture; and having distinguished himself by a pamphlet on the war with France, *Mars Gallicus*, he was promoted, in 1636, to the see of Ypres. In this city he died of the plague, May 6, 1638, just as he had completed his great work, the *Augustinus*, which proved the occasion of a theological controversy the most important, in its doctrinal, social, and even political results, which has arisen since the reformation. Its main object, in which it coincided with the scheme of doctrine already condemned in Bajus (q.v.), was to prove, by an elaborate analysis of St. Augustine's works, that the teaching of this father against the Pelagians and semi-Pelagians (q.v.), on grace, free-will, and predestination, was directly opposed to the teaching of the modern, and especially of the Jesuit schools (see MOLINA), which latter teaching he held to be identical with that of the semi-Pelagians. In the preface he submitted the work to the judgment of the holy see; and on its publication, in 1640, being received with loud clamor, especially by the Jesuits, and at once referred to Rome for judgment, the *Augustinus*—together with the antagonist publications of the Jesuits—was prohibited by a decree of the inquisition in 1641; in the following year, it was condemned as heretical by Urban VIII. in the bull *In Eminentia*. This bull encountered much opposition in Belgium; and in France, the *Augustinus* found many partisans, who were animated by a double feeling, as well of doctrinal predilection as of antipathy to the alleged laxity of moral teaching in the schools of the Jesuits, with whom the opposition to the *Augustinus* was identified (see JESUIT). The most eminent of the patrons of the *Augustinus* were the celebrated association of scholars and divines who formed the community of Port Royal (q.v.), Arnauld, Nicole, Paschal, etc. Nevertheless, the syndic of the Sorbonne extracted from the *Augustinus* seven propositions (subsequently reduced to five) which were condemned as heretical by Innocent X. in 1653. Hence arose the celebrated distinction of "right" and of "fact." The friends of the *Augustinus*, while they admitted that in point of right the five propositions were justly condemned as heretical, yet denied that in point of fact these propositions were to be found in the *Augustinus*, at least in the sense imputed to them by the bull. A further condemnation was therefore issued by Alexander VII. in 1656, which was rigidly enforced in France, and generally accepted; and in 1668 peace was partially restored by Clement IX., at least all overt opposition was repressed by the iron rule of Louis XIV. The more rigid Jansenists, however, and at their head Antoine Arnauld, emigrated from France, and formed a kind of community in the Low Countries. On the death of Arnauld in 1694, the controversy remained in abeyance for some years; but it was revived with new acrimony by the well-known dispute on the so-called "case of conscience," and still more angrily in the person of the celebrated Quesnel (q.v.), whose *Moral Reflections on the New Testament*, although published with high ecclesiastical authority, at various intervals from 1671 till his death, 1710, was denounced to the pope, Clement XI., as a text-book of undisguised Jansenism. This pope issued in 1713, in the

constitution "Unigenitus," a condemnation in mass of 101 propositions extracted from the *Moral Reflections*, which, however, met with great resistance in France. The death of Louis XIV. caused a relaxation of the repressive measures. The regent, duke of Orleans, was urged to refer the whole controversy to a national council, and the leaders of the Jansenist party appealed to a general council. The party thus formed, which numbered four bishops and many inferior ecclesiastics, were called, from this circumstance, the appellants. The firmness of the pope, and a change in the policy of the regent, brought them into disfavor. An edict was published, June 4, 1720, receiving the bull; and even the parliament of Paris, submitted to register it, although with a reservation in favor of the liberties of the Gallican church. The appellants for the most part submitted, the recusants being visited with severe penalties; and on the accession of the new king, Louis XV., the unconditional acceptance of the bull was at length formally accomplished, the parliament being compelled to register it in a *lit de justice*. From this time forward, the appellants were rigorously repressed, and a large number emigrated to the Netherlands, where they formed a community, with Utrecht as a center. The party still remaining in France persisted in their inveterate opposition to the bull, and many of them fell into great excesses of fanaticism. See CONVULSIONARIES.

In one locality alone, Utrecht and its dependent churches, can the sect be said to have had a regular and permanent organization, which dates partly from the forced emigration of the French Jansenists under Louis XIV., partly from the controversy about Quesnel. The vicar-apostolic, Peter Codde, having been suspended by Clement XI. in 1702, the chapter of Utrecht refused to acknowledge the new vicar named in his place, and angrily joined themselves to the appellant party in France, many of whom found a refuge in Utrecht. At length, in 1723, they elected an archbishop, Cornelius Steenhoven, for whom the form of episcopal consecration was obtained from the French bishop Vorlet (titular of Babylon), who had been suspended for Jansenist opinions. A later Jansenist archbishop of Utrecht, Meindarts, established Haarlem and Deventer as his suffragan sees; and in 1763 a synod was held, which sent its acts to Rome, in recognition of the primacy of that see, which the church of Utrecht professes to acknowledge. Since that time, the formal succession has been maintained, each bishop, on being appointed, notifying his election to the pope, and craving confirmation. The popes, however, have uniformly rejected all advances, except on the condition of the acceptance of the bull *Unigenitus*, and the recent act of the holy see, in defining as of Catholic faith the dogma of the immaculate conception of the Blessed Virgin Mary, has been the occasion of a new protest. The Jansenists of the Utrecht church still number about 6,000 souls, and are divided over 25 parishes in the dioceses of Utrecht and Haarlem. Their clergy are about 30 in number, with a seminary at Amersfoort. The Jansenist archbishop of Utrecht has recently consecrated a bishop for the Old Catholic (see DÖLLINGER) community in Germany.

JANSSEN, CORNELIUS. See JANSSENS, CORNELIS J., *ante*.

JANSSENS, ABRAHAM, a celebrated Dutch painter, is supposed to have been b. in Amsterdam about 1569. Of a thoughtless and excitable disposition, he made himself completely miserable by his marriage with a girl of extravagant tastes, and spent his latest years in extreme want. The year of his death is unknown. Many churches in Flanders possess pictures executed by him; the most famous are the "Burying of Christ" and a "Madonna and Child," in the church of the Carmelites at Antwerp. There are also good specimens of his style in the galleries of Munich, Vienna, Dresden, and Berlin. Janssens displayed great vigor in drawing and designing; he was an admirable colorist, and he certainly ranks next, among the historical painters of the period—though at a considerable distance—to Rubens.—**CORNELIS JANSSENS**, probably born in Flanders, died in Amsterdam in 1665, acquired a reputation as a very fine painter of portraits and historical subjects.—Another eminent artist of this name was **VICTOR HONORIUS JANSSENS** (born at Brussels 1664, died there 1739).

JANTHINA, a genus of gasteropodous mollusks of the order *scutibranchiata*, and of the same family (*haliotidae*) with ear-shells. The shell is very similar in form to that of a common snail, but thin and beautifully pellucid. These mollusks are remarkable as inhabitants of the open ocean, in which they swim at the surface of the water by means of a float formed of vesicles containing air, and secreted by the foot. To the under-surface of this float, the egg-capsules are attached. The vesicular float has no more anatomical connection with the animal than the shell has. The *janthinæ* abound in the seas of warm climates; are plentiful in the Mediterranean, but rare on the British coasts.

JANUARY, the first month of the year. It was, among the Romans, held sacred to Jannus (q.v.), from whom it derived its name, and was added to the calendar along with Feb. by Numa. It was not till the 18th c. that January was universally adopted by European nations as the *first* month of the year, although the Romans considered it as such as far back as 251 B.C.

JA'NUS AND JANA, two very old Latin divinities, male and female, whose names are merely different forms of *Dianus* (probably the sun) and *Diana* or *Luna* (certainly the moon). The worship of the former held a high place in the regards of the

Romans. In every undertaking his name was first invoked, even before that of Jupiter, which is the more singular, as Jupiter was unquestionably the greatest of the Roman gods. Perhaps it may be taken as a verification of the tradition, that Janus was the oldest of them, and ruled in Italy before any of the others came thither. He presided not only over the beginning of the year, but over the beginning of each month, each day, and the commencement of all enterprises. On New Year's day, people made each other presents of figs, dates, honey-cakes, sweetmeats, etc., wore a holiday-dress, saluted each other kindly, etc. The pious Romans prayed to him every morning, whence his name of *Matutinus Pater* ("Father of the Morning"). He is represented with a scepter in his right hand, and a key in his left, sitting on a beaming throne (probably a relic of the original, or at least very old worship of Janus as the sun). He has also two faces (whence the expression applied to a deceitful person "Janus-faced"), one youthful, and the other aged, the one looking forward, and the other backward, in which some have professed to see a symbol of the wisdom of the god who beholds both the past and future, and others, simply of the return of the year. Numa dedicated to him the passage close by the Forum, on the road connecting the Quirinal with the Palatine. This passage (erroneously called a temple, but which was merely a sacred gateway, containing a statue of Janus) was open in times of war, and closed in times of peace. It is a striking commentary on the military habits of the Romans, that the place was shut only thrice in 700 years, first by Numa himself, again at the close of the first Punic war, and for the third time, under Augustus. It was also closed by Vespasian in 71 A.D.

JAPAN (native name, *Nipon*—or *Dai Nipon*, Great Nipon—i.e., the Land of the Rising Sun), a very ancient island-empire of eastern Asia, long remarkable for the proud isolating policy of its rulers, and now claiming special consideration, both on account of its recent renewed relations with the civilized world, and the wonderful changes that during the last few years have been in progress in the country.

Japan Proper comprehends four large islands, viz., Nipon (the Japanese mainland), Sikok or Sikopf, Kiusiu, and Yezo, and extends from 31° to 45° 30' n. lat. The empire of Japan—the area of which has been estimated at 266,590 sq. m.—includes about 3,800 small islands and islets besides the four larger ones, and is situated between 26° to 52° n. lat., and 128° to 151° e. long. It is bounded on the n. by the sea of Okhotsk, on the e. by the north Pacific ocean, on the s. by the eastern sea of China, and on the w. by the sea of Japan. In 1872 the population of Japan was 33,110,825.

Physical Features.—The islands of Japan appear to be of volcanic origin, and that part of the Pacific on which they rest is still intensely affected by volcanic action. Earthquakes occur very frequently in Japan, although certain parts of the country are exempt. The Japanese reckon that, on an average, some one of their cities is destroyed every seven years by this agency. Japan has been called the land of mountains; but though these are very numerous, and many of them volcanic, they are of moderate elevation, and rarely attain the limits of perpetual snow. The country generally is of moderate elevation, with fertile valleys, picturesque landscapes, and a coast indented with magnificent harbors; the soil is productive, rich in mineral wealth, and teeming with every variety of agricultural produce. The great volcanic mountain Wunsentake, on a promontory of Kiusiu, reaches to the line of perpetual snow, and is both feared and worshiped by the Japanese. The celebrated and sacred Fusiyama ("Rich Scholar Peak"), the Parnassus of Japan, is an extinct volcano, the highest peak of which reaches to the height of 14,177 feet. Springs, lakes, and rivers are numerous; but the last, being sand-choked and very impetuous, are valuable chiefly for the purposes of irrigation.

Our knowledge of the climate of Japan is yearly increasing. June, July, and Aug. are the months of rain, which sometimes descends in unceasing torrents. The months of Oct. and Nov. are the pleasantest and most genial of the twelve, when fine weather is enjoyed without the scorching heat of summer. The summers are very hot, and the winters in the northern parts almost Siberian; the thermometer rising to 96° in the shade in the former, and sinking to 18° below zero in the latter season. Alcock says: "The thermometer in the shade (during the summer) ranges from 70° to 85°, and averages 80° between the morning and the evening, while it is sometimes below 70° at night." Hurricanes and waterspouts are frequent; dense fogs hide the sun, sometimes for four or five days together; and about the change of the monsoons, typhoons, and equinoctial gales frequently sweep the Japanese seas.

Vegetable Productions.—In Hodgson's *Japan* will be found a systematic catalogue of Japanese flora by Sir William Hooker. We can only mention a few of the most noteworthy trees and plants. Chestnut, oak (both deciduous and evergreen), pine, beech, elm, cherry, dwarf-oak, elder, sycamore, maple, cypress, and many other trees of familiar name abound. The evergreen oak and the maple are the finest of all Japanese trees. The grandest forests of pine, and oaks of prodigious size, grow in Yesso; but the *rhus vernicifera* or lacquer-tree, the *laurus camphora* or camphor-tree, the *broussonetia papyrifera* or paper-mulberry—the bark and young twigs of which are manufactured by the Japanese into paper—and the *rhus succedanea* or vegetable wax-tree of Japan, are among the remarkable and characteristic trees of the country. Bamboos, palms,

including sago-palms, and 150 species of evergreen trees, likewise flourish. Thus, the vegetation of the tropics is strangely intermingled with that of the temperate or frigid zone; the tree-fern, bamboo, banana, and palm grow side by side with the pine, the oak, and the beech, and coniferæ in great variety. The camellia, the paulownia, and the chrysanthemum are conspicuous amongst its indigenous plants. Nymphaeas and parnassia fill the lakes and morasses. The tobacco-plant, the tea-shrub, the potato, rice, wheat, barley, and maize are all cultivated. The flora of Japan bears a remarkable resemblance to that of the North American continent.

Agriculture is the chief occupation of the Japanese. They are very careful farmers, and their farms are models of order and neatness. They bestow great care upon manures, and thoroughly understand cropping and the rotation of crops. The cultivated land is chiefly a light friable loam of great fertility. It grows tea, cotton, rice (the staple production), wheat, maize, buckwheat, millet, potatoes, turnips, beans, and peas. The rice harvest commences in Oct. Wheat is sown in drills in Nov. and Dec., and reaped in May and June. Flails and winnowing-machines, similar to those used in England, are common.

Animals.—Wild animals scarcely exist in Japan, in consequence of the universal cultivation of the soil. A few wolves, foxes, and wild boars still roam in the n. of Nipon. Wild deer are protected by law. The principal domesticated animals are horses, of which there is an indigenous race; oxen and cows, used only as beasts of burden; and dogs, held in superstitious veneration by the people. Birds are very numerous, and include two kinds of pheasants, wild-fowls, herons, cranes, and many species common both to Europe and Asia. There are few reptiles; and of insects, white ants, winged grass-hoppers, and several beautiful varieties of moth are conspicuous.

Mineralogy.—Japan is very rich in minerals. The gold mines of Matsumai and the n.e. part of Nambu have long been celebrated; but the n. of Nipon is, according to the Japanese, one continuous bed of gold, silver, and copper. Silver also comes from the islands to the w. of Matsumai from the province of Shanday, and from the islands in the vicinity of Neagata. The iron mines of Yesso are sealed to Europeans. Both lead and copper mines are worked within a few miles of Hakodadi. The sulphur of Yesso and the adjacent isles is almost inexhaustible, and of wonderful purity. In its abundant supply of coal, Japan resembles Great Britain; coal-beds extend from Nagasaki and Fizen to Yesso and Saghalien. Basalt, feldspar, green-stones, granites red and gray, rock-crystal, agate, carnelian, amber, scoria and pumice-stone, talc, alum, and other minerals are found in greater or less quantities.

Inhabitants.—Ethnologists have referred the Japanese to different types of mankind: Latham classifies them as Turanians, a tribe of the Asiatic peninsular stock; Pickering, as Malays; Prichard, as belonging to the same type as the Chinese; and in the narrative of the United States expedition, they are ranked as a branch of the Tartar family. Physically, the Japanese is distinguished by an oval head and face, rounded frontal bones, a high forehead, slightly oblique eyes—the irides of a brown-black color, the eyebrows heavy and arched. The complexion varies from a deep copper color to the fairness of western nations, but is more frequently of a light-olive tint. The expression of the face is mild and animated. The Japanese “are a people of great qualities and exaggerated defects. They are honest, ingenious, courteous, clean, frugal, animated by a strong love of knowledge, endowed with a wonderful capacity of imitation, with deep self-respect, and with a sentiment of personal honor far beyond what any other race has ever reached. But they are proud, absolute, revengeful, profoundly suspicious, hesitating, and mistrustful, and, in the lower classes, openly and radically immoral. Their organization (until lately) was purely military; war was the only occupation (with the exception of the priesthood) which was considered worthy of a man; agriculture was left to serfs; while commerce was regarded as degrading. The fighting-classes had the utmost contempt for trade, and the entire people were deficient in the commercial aptitudes.” The town costume of the Japanese gentleman consists of a loose silk robe extending from the neck to the ankles, but gathered in at the waist, round which is fastened a girdle of brocaded silk. Over this is worn a loose, wide-sleeved jacket or spencer, decorated with the wearer’s armorial device. A cylindrical cap made of bamboo and silk, white stockings, and neat straw sandals, complete the attire. Trousers are only worn by official persons on occasion of special ceremony. A head entirely shaven is the distinctive mark of priests and the higher class of medical practitioners; in others, the hair is shaved off about 3 in. in front, combed up from the back and sides, and glued into a tuft at the top of the head, where it is confined by pins of gold or tortoise-shell. The hair of the women is more abundant, but otherwise their dress very much resembles that of the men. In the country, a short cotton gown is often the only clothing, and the lower classes go almost in a state of nudity. The men are generally elaborately tattooed over the greater part of their bodies with figures of men and women, bright blue dragons, lions, tigers, etc. The women have a mania for painting and powdering their skins.

Manners and Customs.—The most remarkable custom of the Japanese is that of *harri-kari* or *hara-kiru* (or *hara wo kiru*, i.e., “belly-cut”), a legalized mode of suicide, by making two cross-cuts on the abdomen with a sharp-pointed knife. This custom, according to some recent accounts, is now less frequent, and the ceremonies with which

it was once performed have become obsolete. There are still, however, professors of the art in most large cities. The curious custom of *nay-boen* or *naibun* consists "in ostentatious secrecy as regards events, or *incognito* in reference to persons." Well-known events are totally ignored, and individuality is unrecognized under shelter of the *nay-boen* privilege.

The social position of women is, in some respects, more favorable than in most pagan countries. The ladies of Japan, however, live in strict seclusion, and little is known about them. Female education is not neglected. Polygamy is not allowed, but the power of divorce is permitted to the husband by law. The laws against adultery on the part of the wife are severe, and death is the penalty, which may be inflicted by the husband. He, on the contrary, may take as many concubines as he pleases or can afford. The marriage ceremony is an important part of social etiquette; the families of both bride and bridegroom meet and celebrate the event. Saki flows abundantly, and great feasting and hilarity prevail. When a maiden marries, her teeth are blackened, her eyebrows plucked out, and artificial ugliness is henceforth cultivated to the greatest possible extent. The Chinese custom of afflanching children is followed by the upper classes, and aristocratic usage interdicts a personal interview to the bride and bridegroom previous to marriage; but this rule is now much relaxed. Prostitution is a legalized custom, and a father may sell his daughter, for this purpose, for a term of years; whilst the Japanese gentleman, notwithstanding his high notions of honor, often chooses his wife from amongst the inmates of those houses of ill-fame, which are at once supported and controlled by government. The bath is a great institution in Japan, and forms a kind of people's parliament. It is the general custom throughout the country for men and women to bathe together, with a total absence of decorum, but without sense of immodesty. In Japan the social position of every man is fixed by his birth, and the line that separates class from class is not only clearly defined, but impassable. Daimios and saimios, priests and soldiers, are considered to belong to the higher classes, and in the others are included medical men, inferior government officials, merchants, retail dealers, and laborers. There are 8 classes of society, half of which belong to the upper, and the other half to the lower ranks of society. Men of rank only can enter a city on horseback; but these distinctions will now be greatly modified, if they do not pass away altogether, with the double sovereignty, and the feudal power of the daimios. The ordinary vehicle in Japan is a description of palanquin: the common sort, made of bamboo, is called a *cango*; the better kind, made of lacquered wood, a *norimon*. The Japanese manifest great regard for the dead. The ancestral tablet (*recipae*) is fashioned on the Chinese model, and is placed in the family shrine with the household gods. In a Japanese cemetery, the solid and elaborately carved granite monuments are beautiful specimens of architectural taste. Each body is buried in a sitting posture, with the hands folded in the attitude of devotion; and the coffins are all circular. The Japanese observe many holidays, and celebrate the opening of the year in the Chinese fashion. There are, too, many holidays of a religious character, but the great national festivals are 5 in number. The Japanese are a theater-loving people, and inveterate gamblers. They delight in wrestling—their national sport—perform wonderful feats in spinning tops, are very expert jugglers, and excel in archery. Fish and rice are the staple food of the people, and tea and saki (a spirit distilled from rice) their beverages.

Government, Institutions, and Present Condition.—To understand something of the government and institutions of Japan, past and present, it will be necessary to glance at its history and political landmarks. Here we find an emperor, whose dynasty began to reign 2,532 years ago, or 660 B.C. Its founder, Zinmu, or Zen Mou, was contemporary with Nebuchadnezzar; and in 1868, after a duration of 25 centuries, it threw off the oppression and decrepitude of 676 years, and in the person of Moutz Hito, the present mikado or emperor (the 122d of his race), entered upon a new and promising career. The principal landmarks of Japanese political history are briefly as follows: A time of anarchy and faction on the one side, and a succession of feeble sovereigns on the other, enabled Yoritomo, the shiogun or generalissimo (from *Ta-tsiang-kiun*, the Chinese term for "the great chief or commander of the army")—or tycoon (Chinese *Tai Koon*, i.e., "Great Lord"), as he is called in recent treaties—to usurp the supreme authority. This occurred in 1193 A.D.; but the creation of a shiogun by the mikado dates from 85 B.C. This high officer was subsequently known to Europeans as the temporal emperor, and to the mikado they assigned purely spiritual functions; but the Japanese themselves recognized one sovereign only, viz., the mikado, who held his court at Miako, while his rival in Yedo acted as real sovereign, at the safe distance of 300 m.; and the shiogunate became henceforward a permanent institution. It might now be said that the shiogun governed, but did not reign; while the mikado reigned, but did not govern; though three times a year he received the homage of his all-powerful subject. He even continued nominally the sole temporal emperor, though pensioned by the shiogun, and deprived of all real authority. In 1603 the shiogun Tokugawa Iyeyas (the "illustrious") organized a government which secured to the empire a peace of 200 years. He founded likewise a permanent succession, and his descendants reigned at Yedo till 1868. His system was perfected by Iyemits, the third shiogun of the Tokugawa dynasty. It was his policy "to preserve unchanged the condition of the native intelligence," "to pre-

vent the introduction of new ideas," and to effect this he not only banished foreigners, interdicted all intercourse with them, and extirpated Christianity, but introduced that "most rigid and cunningly devised system of espionage" that was in full activity at the time of the earl of Elgin's mission, as amusingly described by Mr. Oliphant. "This espionage," says a recent Japanese writer, "held every one in the community in dread and suspicion; not only the most powerful daimio felt its insidious influence, but the meanest retainer was subject to its sway; and the ignoble quality of deception, developing rapidly to a large extent, became at this time a national characteristic. The daimios, who at first enjoyed an honorable position as guests at the court of Yedo, were reduced to vassalage, and their families retained as hostages for the rendition of a biennial ceremonial of homage to the shiogun. Restrictions surrounded personages of this rank, until, without special permission, they were not allowed to meet each other alone." In 1549 St. Francis Xavier introduced the Roman Catholic religion into Japan, and the Portuguese (who first landed in Japan in the year 1543) carried on a lucrative trade; but by-and-by the ruling powers took alarm, ordered away all foreigners, and interdicted Christianity (1624), believing that foreigners impoverished the country, while their religion struck at the root of the political and religious systems of Japan. The converts to that form of Christianity introduced by Xavier, were found to have pledged their allegiance to a foreign power; while their conduct is said to have been offensive towards the Sinto and Buddhist temples; so that in time they came to be regarded as a dangerous and anti-national class whose extirpation was essential to the well-being of the nation, and to the success of the political system then being organized or perfected by Iyemits. The Portuguese continued to frequent Japan till 1638, when they and their religion were finally expelled; Christianity was suppressed with every cruelty, and at the cost of some 50,000 lives; its professors were murdered, and the ports closed to foreign traffic. From this date the Japanese government maintained the most rigid policy of isolation. No foreign vessels might touch at Japanese ports under any pretense. Japanese sailors wrecked on any foreign shore were with difficulty permitted to return home; while the Dutch, locked up in their factory at Decima, might hold no communication with the mainland; and the people lived like frogs in a well, till 1853, when they were rudely awakened from their dream of peace and security by commodore Perry steaming into the harbor of Yokohama, with a squadron of U. S. war-vessels. He extorted a treaty from the frightened shiogun (March 31, 1854), and Japan, after a withdrawal of 216 years, entered once more the family of nations. Other countries slowly followed the example of the United States: Russia and the Netherlands in 1855; our own treaty followed in 1858; that with France in 1859; with Portugal in 1860; with Prussia and the Zollverein in 1861; with Switzerland in 1864; with Italy in 1866; and with Denmark in 1867. By these the seven Japanese ports of Yokohama, Nagasaki, Kanagawa, Niegata, Hiogo, Osaka, and Hakodadi have been opened to foreign commerce.

It will thus be seen that "the history of the empire of the Rising Sun is divisible into four distinct periods: the first, which ends with the landing of the Portuguese in 1543, is purely local; the second, which extends from 1543 to 1638, includes the story of St. Francis Xavier, the trade with Portugal, the persecutions, and the final expulsion of Europeans; the third, from 1638 to 1854, is distinguished by the Dutch monopoly, and the resolute exclusion of all foreigners; in the fourth, since 1854, Japan has once more become accessible to everybody."

In the Japan of 1854 we went back to Europe of the 12th c.—to the feudalism of England under the Plantagenets. An aristocratic caste of a few hundred nobles—the daimios or territorial princes of Japan (278 in number)—ruled large provinces with despotic and almost independent authority; their incomes reaching in one or two instances to £800,000. The shiogun gave deep offense, both to the daimios and the nation, by signing the Perry treaty at all; but especially by signing it without the sanction of the mikado, and for ten years a policy of assassination and deadly hatred to foreigners (whom the government could not protect) was carried out. This resulted in the two bombardments of Kagoshima Chioshiu, by the English and combined fleets, which opened the eyes of the Japanese to the power of the western nations, and awakened in their minds an intense desire to raise their country to an equality with them. A complete reaction in favor of the despised foreigners set in; and a desire for a strong central government—"the unification of the nation in the hands of the mikado"—who was urged by the most powerful of the daimios to suppress the shiogunate. The shiogun tendered his resignation; but, notwithstanding, a *coup d'état* appears to have been necessary for the complete extinction of the shiogun and his party. This was carried out in the winter of 1867-68, and after a short but sharp civil war of some six months' duration, the shiogun, with his partisans, were defeated, and the shiogunate (or "government under generalissimo") became a thing of the past. The daimios decided upon a grand act of self-sacrifice, and suppressed themselves. "Two hundred and seventy-eight military princes, possessing regal powers, vast wealth, and separate armies, abdicated from purely patriotic motives, the station which their families had held for twenty centuries!"

The Japanese government is now organized partly upon the French imperial system, and presents the following features: (1.) The mikado is supreme in temporal and spirit-

ual matters; (2.) An executive ministry divided into eight departments, viz.—foreign affairs, war, navy, finances, the interior, justice, public instruction, and ecclesiastical affairs; (3.) A senate (*sain*) of thirty members, and a council of state (*shoin*), members unlimited; (4.) A “great council”—by which the government is really carried on—divided into three sections, viz., the center, composed of the prime minister, vice-prime minister, and five advisers; the right, which includes the ministers and vice-ministers of the eight departments; the left, formed entirely of the council of state, whose functions correspond to the French *conseil d'état*. All matters of high importance are decided by the great council and the mikado; but ordinary questions are left to the ministers, individually or in cabinet. An elective parliament is in contemplation. In 1871 the provincial administration was taken from the ex-daimios; and “prefects,” with extensive powers, have been appointed, one to each of the 75 districts into which Japan is now divided.

Great progress is being made in finance, education, and public works, as well as the reconstruction of both army and navy. The public debt in 1878 was £72,645,140. There is a reserve fund of £7,806,300. In the budget, approved by the council for the year 1877-78, the total receipts amounted to £10,251,288, the expenditure just balancing the revenue. It was apportioned substantially as in the budget of 1872, the items of which, slightly condensed, are as follows:

	RECEIPTS.
Rice, at 4½ dollars per koku.....	£11,444,556
Customs.....	298,350
Internal revenue (excise duties, etc.).....	225,675
Miscellaneous.....	260,950
 Total of receipts.....	 £12,229,531
	EXPENDITURE.
Imperial household.....	£113,050
Ministry of foreign affairs.....	112,200
Army.....	1,700,000
Navy.....	382,500
Colonization of Yeso.....	418,838
Justice.....	16,150
Education.....	73,312
Finance department (including cost of collecting taxes).....	369,962
Public works.....	1,763,112
Municipal and provincial governments.....	1,386,987
Miscellaneous.....	452,412
Cost of manufacturing new bank-notes and of establishing the mint.....	210,375
Pensions to daimios and retainers.....	4,024,112
Balance of indemnity to European powers on the Simonosaki affair.....	318,750
Interest on the English loan.....	78,625
 Total of expenditure.....	 £11,420,385
Surplus, £809,146.	

It will be seen that the bulk of the revenue is derived from the rice-tax, which is a very certain and productive impost; but as the principle of taxing the staple food of the people is radically wrong, and in this instance it weighs very unfairly upon the agricultural population (absorbing one-third of the entire annual crop), the newly inaugurated government is considering how gradually to diminish, and to replace it “by other duties less objectionable, and more in harmony with the spirit which now guides the country.”

A ministry of instruction was created in 1871, and public primary schools are being established in towns. Light-houses, dock-yards, the buoying of harbors, and the construction of roads and railroads, have all been in progress during the last three years. A railway from Yedo to Yokohama has been made, and telegraphs are in course of erection. Newspapers and printing-presses have started into existence, and books are eagerly read. The government has engaged foreign professors of languages, and sent some 500 state students to Europe and America. The army is being armed and organized on the French model, and instructed by French officers. In 1876 the numbers of the active army were 35,380 men. On the war footing the total amounts to 50,240. The navy has at present 21 vessels of all classes. The western calendar (excepting only the names of the month, which are represented by numbers) has, by a recent decree, been adopted; and a national code of laws based on the Code Napoleon, is being drawn up.

Religions of Japan.—The two principal and national religions of Japan are Sintuism or Sin-syuism (from *sin*, the gods, and *syu*, faith), the ancient creed of the country, and Buddhism, which is exotic and comparatively modern. The doctrine of Confucius, as held by the literati of China, has also considerable influence under the name of Sooto, or “the way or method of philosophers;” but it is less a religion than a system of morals and philosophy. 1. Sintuism. The hierarchy of Sin-syu is composed of the mikado, two ecclesiastical judges, together with the monks and priests. The chief

object of Sintu worship and belief is *Ten-sio dai-sin*, the great sun-goddess. The spiritual emperor, mikado, is held to be the direct descendant of the sun-goddess, and, as such, unites in his person all the attributes of the deity. The minor deities of Sintuism are very numerous, for every hero, warrior, patriot, or public benefactor receives a regular apotheosis and canonization at his death, and is henceforth reckoned among the *kami* or demi-gods. Every district has its patron saint or *kami*; and the shrines erected to the popular divinities are innumerable. Sintu temples are usually built on elevated ground and surrounded by groves; no idols are visible in them; but above and around, written sentences are inscribed. A mirror, as an emblem of the purity required in the worshipers, is placed on the altar. The chief doctrines of this indigenous religion of Japan are: 1. Inward purity of heart; 2. A religious abstinence from whatever makes a man impure; 3. A diligent observance of the solemn festival and holy days; 4. Pilgrimages to holy places; and 5. According to some, chastising and mortifying the body. The form of worship is simple: the worshipers first wash themselves in the font, pray opposite the mirror, throw a few cash into the money-box, and finish by striking a bell, to intimate that their religious duties are over.

2. In Japan, Buddhism, which was introduced 552 A.D., has been modified by its contact with Sintuism, with which it has to a certain extent amalgamated. No less than eight Buddhist sects exist in Japan. Buddhism has properly no priests, but here the monks appear to have assumed the functions of that order. Dr. Smith has given an interesting description of a Buddhist service he saw at one of the temples in that country (see his *Ten Weeks in Japan*, p. 34). "Amongst the services which I ever witnessed," he says, "I seldom beheld in a pagan country an assemblage of native worshipers so nearly approaching the appearance of a Christian assembly and the details of an ordinary Christian service." Amongst the more educated classes, the same sceptical indifference to the religious observances of the multitude that prevails in China is observed.

The Japanese Written Language.—The principle of duality, which pervades the life of the Japanese, extends to their mode of writing, for two distinct alphabets and kinds of writing are in use. There is, 1st, the ideographic system of Chinese hieroglyphic symbols, which dates from the 3d c., A.D.; and 2dly, the phonetic syllabarium, of more recent invention, consisting of 47 characters, and a few supplementary monosyllabic sounds. Prior to either of these, some antique form of writing, now consigned to oblivion, is supposed to have existed.

The phonetic alphabet, invented about the year 810 A.D., is known as the *hiragana* form of character. In process of time, this system was rendered more complex by the addition of variations, and this led, apparently, to the introduction of another and simpler alphabet, entirely without variants, and known as the *katagana* character. Both these phonetic systems are written in perpendicular columns. It is not a little remarkable that the Chinese ideographic symbols retain their ascendancy over the indigenous alphabets, and are adopted almost exclusively for diplomatic documents and the higher class of books. In common life, the Chinese written language is in familiar and constant use.

There is no similarity whatever between the spoken languages of China and Japan; the latter—one of the softest tongues out of Italy—is not very difficult of acquisition, and is without the Chinese system of intonations; it is not monosyllabic, but what Dr. Latham calls agglutinate.

The literature of Japan is abundant and various, and includes works on history and science, encyclopædias, poetry, prose fiction, and translations of European works. Besides original writings, the Japanese have adopted the whole circle of Chinese Confucian literature; the Chinese classics, indeed, form the basis of their literature, system of ethics, and type of thought.

In the mechanical arts, the Japanese have attained to great excellence, especially in metallurgy, and in the manufacture of porcelain, lacquer ware, and silk fabrics; indeed, in some of these departments, works of art are produced, so exquisite in design and execution as to more than rival the best products of Europe. The Japanese have long understood lithochrome-printing. Their drawings of animals and figures generally are wonderfully graphic, free, and true to nature; but in landscapes they fail, from erroneous perspective; and of the art of painting in oils they are entirely ignorant.

The commercial intercourse of Japan is now carried on mostly, with Great Britain, and the United States of America.

The following table shows the extent of the trade by exhibiting the value of the total exports from Japan to Great Britain, and of the total imports of British and Irish produce and manufactures into Japan during the five years 1872-76.

Years.	Exports from Japan to Great Britain.	Imports of British Home Produce into Japan.
1872	£184,342	£1,961,327
1873	561,390	1,680,017
1874	537,136	1,282,899
1875	377,791	2,460,227
1876	657,145	2,032,685

The principal item of export from Japan to Great Britain is raw silk, valued in 1876 at £432,234; next in value come tobacco, wax, and rice. The staple British import is cotton goods, valued in 1876 at £1,328,461; also woolen fabrics and iron.

Upwards of 60 m. of railway have been opened for traffic. The Japanese telegraph system extends over 1750 miles. In 1876 the post-office, established in 1871, carried 30,312,100 letters, and had a revenue of £119,040. The basis of the new Japanese money system is the *yen*, equal to the American trade-dollar.

For the latest information on Japan, see Adams, *History of Japan* (Lond. 1874); Mossman, *New Japan* (Lond. 1873); Arinori Mori, *Education in Japan* (New York, 1873); article "Japan," *Blackwood's Magazine*, Sept., 1872; *The Merchant's Handbook*, by W. A. Browne (Lond. 1872); *Japan*, being a sketch of the history, government, and officers of the empire (Lond. 1869); *Japan in our Day*, by B. Taylor (New York, 1871); *The Statesman's Year-book*, by F. Martin (Lond. 1878); and for general reference, see *The Capital of the Tycoon*, by sir Rutherford Alcock, K.C.B., etc. (Lond. 1863); *A Residence at Nagasaki and Hakodati in 1859-60*, by C. P. Hodgson (Lond. 1861); *First Elements of Japanese Grammar*, etc., by R. Alcock, esq.: *Narrative of the Earl of Elgin's Mission to China and Japan in the years 1857, 1858, and 1859*, by Lawrence Oliphant (Lond. 1859); *The History of Japan*, by Engelbert Kämpfer, M.D. (Lond. 1727).

JAPAN (ante). Native name Dai Nippon, or Nihon, from *ni*, sun, *hon*, root or rising; first bestowed either by the Coreans or the inhabitants of the south-western provinces—which were first peopled—and found in the native literature as early as A.D. 670. The Japanese empire comprises Chishima (Kurile islands), Yezo ("Jesso"), Hondo (Main island), Kiushiu (nine provinces), Shikoku (four provinces), the Riu Kiu (Loochoo) islands, and the islands lying off the western and eastern coasts, including the Bonin group—about 4,000 in all. From ancient times the empire has been divided into *do*, or circuits, after the Corean fashion, named as follows: "The home provinces," or Go Kinai, surrounding the *miako*, or capital, Kioto; Tokaido, east-sea circuit; Tozando, eastern-mountain circuit; Hokurikudo, northern-land circuit; Sanindō, mountain-back circuit; Sanyodo, mountain-front circuit; Nankaido, southern-sea circuit; Saikaido, western-sea circuit; Hokkaido, northern-sea circuit. These terms correspond to our eastern states, middle states, etc. In 1868 there were 84 *shiu*, or provinces, and 717 *kori*, or districts, each of the former having a purely native and a partly Chinese name, just as the eastern states are called "New England." Thus, Echizen is also called Esshiiu, and Kaga, Kashiu. In 1875 the empire was divided into 38 kens, or prefectures, governed by *rei*, or prefects, appointed from Tokio; with 3 imperial cities, or *fu*—Tokio, Ozaka, and Kioto—governed by *chiji*, or mayors. Yezo and Chishima are under the Kai Taku Shi, a special department. The official census of 1872, and again of 1874, gave Japan a population of nearly 33½ millions. The actual area of cultivated lands is: rice fields, 5,585,900 acres; of all other fields, 3,817,300 acres, on which the government tax collected was \$46,537,265. The total value of productions from agriculture, forests, and fisheries was \$276,303,903; of manufactures, including tea, tobacco, and all natural productions requiring manufacture, \$147,602,026; of mines and quarries, \$4,762,387; grand total, \$428,668,316. The foreign trade of Japan for the year ending Dec. 31, 1878 was: imports, \$33,334,392; exports, \$26,259,419; total, \$59,593,811, of which \$42,104,221 was shipped at Yokohama: 838 ships and 748,872 tons were distributed under the following flags: British, 487 ships and 417,691 tons; America, 180 ships and 212,266 tons; the others in order being German, French, Swedish, Danish, etc. In 1878, 2,477 Europeans and Americans resided in Japan; 1067 being British, 479 Americans, 300 Germans, 278 French, 105 Dutch, 95 Portuguese, and 209 of various countries, besides 3,028 Chinese. Since 1860 Japan has sold to foreign countries produce amounting to \$200,109,872, and received in exchange foreign merchandise amounting to \$323,027,581. American imports consist chiefly of cotton and woolen goods, machinery, metals, arms and ammunition, "notions," and petroleum, the latter article amounting in 1878 to \$1,856,881. Besides sailing vessels, two American steam lines ply between California and Japan. Nearly all the tea raised in Japan and exported is consumed in the United States. The chief exports are silk and silk-worms' eggs, tea, copper, tobacco, wax, camphor, coal, dried fish, rice, porcelain, lacquer, and other articles made by hand. The present internal and external condition of Japan can be best understood from a brief outline of the history of this island empire, whose development since 1868 has been one of the marvels of the century.—It is now well settled by students in comparative philology of the languages of Japan and Corea that the two tongues are closely affiliated, and that ethnically the Coreans are the nearest congeners of the Japanese. The ancient immigrants from the n. Asiatic mainland coming to the Japan archipelago found an aboriginal race, whose descendants are probably the Ainos of to-day, though in Kiushiu were some inhabitants of Malay extraction. The dominant race had their seat in Yamato, one of the central provinces near Kioto, and ruled the tribes subdued by them according to a rude feudal system, the suzerain of the tribe chiefs being the mikado. In the 5th c. the rudiments of Chinese-Corean civilization were introduced from Corea, with letters, literature, and the Confucian classics. In 552 A.D. Buddhist missionaries arrived from Corea. In the 8th c. the Chinese centralized system of government was copied by the Japanese, and ancient feudalism gave way to eight ministries or boards of government, the mikado

sending out governors to the provinces from the miako or capital at Nara, and from 794 A.D. at Kioto. The dai jo kuan, or great council of the great government, superintended the eight boards, and was presided over by the senior premier, or dai jo dai jin (great minister of the great government), with three junior prime ministers, or *sa*, *u*, and *nai*, dai jin, or left, right, and inner, the mikado being supreme over all. From the most ancient times the mikado has ever been the central figure in Japanese politics, and though rival generals, ambitious premiers, and usurping military officials, called shoguns, or, since 1854, tycoons, have held at times immense power, and though to foreign eyes they have seemed to be "emperors," yet there never was but one emperor in Japan, and he was the mikado. The tycoon was never in rank or fact anything but a military commander. There have been four lines or families of shoguns ("tycoons"), the Minamoto (1192-1219), the Hojo (1219-1333), the Ashikaga (1333-1573), the Tokugawa (1603-1868), but there has been only one dynasty of mikados—an imperial family having no names except the personal cognomen of each ruler. The line of mikados is the oldest dynasty in the world, the present sovereign, Mutsuhito, being the 133d of the line. The term mikado means great gate (similar to the terms sublime porte, pharaoh, etc.) or august place. In the 133 names on the list, none is repeated, though the same mikado has in several instances reigned twice. Nine of the line were females. Succession to the throne is not always to the eldest son, but to the nominee of the mikado among his children, or nearest relatives, or of the imperial household. The cadet families and offspring of the mikado not eligible to the throne form the court nobility called the kuge. Among the most ancient families were the Taira, Minamoto, and Fujiwara, whose descendants are still numerous. The two former increased to military clans, which, after two centuries of aspiring rivalry, finally came to blows in Kioto in 1156. At first the Taira (or Hei) family was in the ascendant, but in 1184 the Minamoto (or Gen), after repeated land battles, nearly annihilated the Taira in a great naval battle off Shimonoseki (see SHIMONOSEKI). Yoritomo, the head of the Minamoto, rebuilt Kamakura, a town near the modern Yokohama, in great splendor, and in 1192 received from the mikado the title of sei-i tai shogun—great rebel, subduing general. After the decline of the Minamoto family in 1219, the Hojo family held the military power, which had now become a usurpation, the mikado having the name but not the actuality of power. The feudal system, which had been growing into form under Yoritomo, received immense development under the Ashikagas (who succeeded the Hojo), since they made the military magistracies, first established by Yoritomo, hereditary in the families of their own nominees. Nobunaga overthrew the Ashikagas, and partially subdued the empire, which had been long in a state of anarchy, in the name of the mikado. Nobunaga's work was taken up and finished by Hideyoshi, who, after unifying all Japan, which had been split into feudal fractions, parceled out his fiefs to military chieftains, without regard to the sovereign, by titles granted in his own name. In 1586, having attained to the office of dai jo dai jin, he retired in 1591 in favor of his son, and hence was called the taikō (great emeritus), or popularly, Taiko-sama. He sent an army of invasion to Corea (see COREA), which was withdrawn at his death in 1597. Ieyasu, the founder of the Tokugawa line, succeeded Hideyoshi after the decisive battle of Sekigahara, and followed out the precedent of Taiko-sama in bestowing fiefs in his own name. Since he ruled the country with a firm hand, and all men saw in him "the man on horseback" that could keep in check by his iron hand the turbulent daimios, the mikado bestowed on him the title of sei-i tai shogun in 1603. Establishing his seat of government at Yedo, this once obscure village became a colossal city within two generations. Kioto was the city of the mikado, the throne, and the imperial court. Yedo was the city of camps. Kioto was the source of all power; Yedo was the place of its execution. Fifteen Tokugawa shoguns ruled from 1603 to 1868. The first shogun ever styled "tycoon" in official documents was Iyesada (1853-58), under whom the treaty with the United States was made. The wondrous growth of events whose fruits have been the revolution of 1868, and the radical alteration of the foreign policy of the empire, had its roots in the revival of the study of the ancient history, language, and religion, beginning over 160 years ago. The incoercible reverence of the people for the mikado, the long-slumbering hatred of the usurping Tokugawas among the subject daimios, the opening of the eyes of scholars to the fact that the Yedo military rulers were usurpers, and that they had further insulted the mikado by signing a treaty in which "the land of the gods" was opened to foreigners, and the hateful title of tycoon (anciently a title of the mikado) officially used by the servant of the sovereign, roused the nation to a pitch of wrath that finally broke out in the *coup d'état* in Kioto, Jan. 3, 1868, and the battle of Fushimi, Jan. 27. By these two measures the office of shogun was abolished, the Tokugawas took their true places as vassals, and the ancient government, in vogue from the 8th to the 12th c., was restored, the mikado being sole ruler, aided by the dai jo kuan and the eight boards of government. The national capital was changed to Yedo, henceforward named Tokio, and officially and popularly so-called (except in unrevised cyclopaedias and foreign documents, in which precedent and not fact is followed). Finding it impossible to drive out the foreigners, as many of the patriots desired, the new government ratified the treaties, and thenceforward followed in quick succession those radical changes in the national policy which make Japan the wonder of nations. The feudal system, after seven centuries' existence, was abolished in Aug., 1871, and the daimios made to

reside as pensioners in Tokio. The mikado appeared in public as the active patron of the dock-yards, light-houses, hospitals, schools, colleges, railways, and telegraphs, which were rapidly established. An embassy headed by the u dai jin Iwakura and four cabinet ministers, with over fifty attachés, started on a tour around the world, accredited to the treaty powers, with the special object of getting the extra-territoriality clause removed from the treaties, and to study the methods and resources of modern civilization. The embassy was absent nearly two years, and cost Japan \$750,000. In 1872 Japan gave the death-blow to the "coolie" trade by releasing the Macao Chinamen from the Peruvian ship *Maria Luz*. Two legations and three consulates were established abroad. These diplomatic foreign establishments of Japan now number about twenty. The newspaper press was established, there being now over 200 printed in the empire. The national banking and postal system were founded on the American model; 200 national banks exist in Japan from the Riu Kiu islands to Yezo. In 1877, 38,321,971 letters, postal cards, and newspapers were carried in the Japanese mails. Japan is now a member of the international postal union, and her stamps and cards are exchangeable in all countries of that union. The post-offices for foreigners at her treaty ports are also under her charge. Postal savings-banks are numerous and well patronized. A mercantile marine training school and a marine board of examination and license of competent masters, engineers, and pilots is connected with the postal department, which owns a fine fleet of steamers. The mercantile marine of Japan consists of about 100 steamers and 5,000 junks. The national navy consists of 5 ironclads built in England, and 10 wooden vessels, with a number of dispatch boats, etc. The naval department is equipped in first-class style for theoretical and practical work, with colleges, schools, bureaus of hydrography, dock-yards, stations, etc. The naval force, including marines, numbers 7,000 men. The army, on a peace footing consists of 31,680 men, and on a war footing, 50,250, of all arms of the service. The soldiery and peasantry, who since the middle ages had been separated, were amalgamated by the military law of Dec. 28, 1872, by which 6,000,000 males are enrolled as possible soldiers. The military resources of the mikado's government have three times been put to the test by revolts in Kiushiu headed by men dissatisfied with the policy of the government. The great Satsuma rebellion led by Saigo Takamori, which began Feb. 1, 1877, was put down only after seven months of hard fighting; 39,760 rebel troops were engaged, of whom 3,533 were killed, and 4,344 wounded; the imperialists losing probably 10,000 in killed and wounded, out of a force engaged of over 50,000. This civil war greatly added to the national debt, which now amounts to \$349,826,662, a large part of which accrued by the assumption of the daimio's debts, and by the cashing of the hereditary pensions of the samurai or gentry. In almost all the features of modern national life and civilization, Japan is, in outward form at least, rapidly coming abreast with most of the Christian nations. The presence, operation, and wonderful success of Christianity in its three forms, Greek, Roman, and Protestant, in Japan, together with the moral reforms instigated and carried out by the government and individuals, bid fair to infuse within the ribs of outer appearance the real life and soul of genuine Christian civilization. For further details, and the exposition of ideas, facts, and principles as embodied in the lives of men and the history of places, see the various titles in this work which refer to Japanese subjects. Besides the standard works on Japan written before the recent opening of the country to foreign life, see *Japan*, by Walter Dickson; *History of Japan*, by F. O. Adams; *The Mikado's Empire*, by W. E. Griffis; *Progressive Japan*, by gen. Legendre. On Japanese art, see Jarves's *A Glimpse at the Art of Japan*; *Art and Art Industries of Japan*, by sir R. Alcock; *A Grammar of Japanese Ornaments*. The best works on the language are: Grammars—S. R. Brown's *Colloquial Japanese*; Astor's *Grammar of the Written Language*; Satou's *Kuaiwa Hen*; Brinckley's *Self-Instruction for Japanese*; Hoffman's *Japanese Grammar*. Dictionaries—J. C. Hepburn, LL.D., *Japanese-English and English-Japanese*, and pocket edition of same; *English Japanese Dictionary*—by Ernest Satou and M. Ishibashi.

JAPAN CLOVER, a leguminous plant, *Lespedeza striata*, a native of China and Japan, brought to the United States probably about 1850, and has spread with great rapidity in various parts of the southern states, especially on light, sandy soils. It is a perennial plant from a foot to 20 in. high, bearing trifoliate leaves, in the axils of which are small flowers which develop into a small one-seeded pod. It is much liked by cattle, especially the young plants; but the old plants contain considerable woody fiber. Agriculturists differ in opinion as to its merits as a fodder, but the weight of testimony is in its favor.

JAPANNING is the art of giving a coating of varnish and other materials to certain manufactures, by which a resemblance is produced to the beautiful lacquered wares of Japan and China. The term is more generally applied in this country to metal works upon which a dark-colored varnish is applied with heat, but the process is quite as extensively applied to papier-mâché works. See LACQUERING. The japanned works of our manufactures are chiefly iron and tin, such as coal-boxes, tin canisters, and other articles, which are thereby made more ornamental, and are at the same time protected from rust.

The japanning material consists of anime or copal varnish, alone, or mixed with

ivory-black, to produce a black japan; or with asphalt, to produce a dark or light brown, according to the quantity used. For very cheap tinned wares, a single coating is all that is usually given. After being varnished, they are put into a heated oven for a time, after which they are ready for use; but in the case of more valuable articles, such as the handsome coal-boxes of iron which are now extensively manufactured, and which are still further ornamented by gilding and painting, several coats of black japan varnish are applied, each being dried in the oven previous to the application of the next, so that a coating of sufficient substance to bear polishing is thus obtained. Rotten-stone and Tripoli powder are used by the polisher, and a beautiful surface is obtained, in no respect inferior to that of polished jet. The polishing powders are at first applied with leather, but the finishing is done by women, who use the palms of their hands only, with small quantities of Tripoli.

The beautiful black surface thus produced is admirably adapted for decoration by gilding; and much taste is now shown in these matters by our manufacturers, who surpass all others in the high finish and cheapness of japanned wares. Under LACQUERING will be given the Japanese process, which is thus imitated on metal, under the name of japanning, in Europe.

JAPHETH, in Heb. *Yepheth*, a word apparently derived in Genesis from *pathah*, "to open," trop. perhaps "to stretch forth," and hence supposed to mean "widely dispersed." Gesenius and other scholars, however, suggest a derivation from *yaphah*, "to be fair" or "beautiful," in allusion to the fair complexions of the Japhetic or European races. According to the Hebrew record Japheth was the second son of Noah, whose descendants peopled first the n. and w. of Asia, after which they proceeded to occupy "the isles of the Gentiles," i.e., all the region about the Levant and the Aegean sea. Japheth has at a later period, in Talmud and Midrash—not merely from its similarity to the Greek name Japetus, the supposed founder of the human race—been used as a typical expression for "Greek." Cf. *Meg.* 71, b.; *Ber. R.* 40, b. etc.

JAPURÁ, or CAQUETA, a river of South America, and tributary of the Amazon, rises in the Granadian Andes, in lat. $1^{\circ} 26'$ n., long. $76^{\circ} 50'$ w., and joins the Amazon about $65^{\circ} 50'$ e. long. Its entire length is upwards of 1000 m.; the navigation is impeded by cataracts.

JAPYGIA. See APULIA, *ante*.

JARGONIZING is a phenomenon observed chiefly in acute mania; it consists in the utterance of uncouth and unintelligible sounds, which may resemble articulate words, or be little more than harsh ejaculations and bellowings. This symptom must not be confounded with those imitations of foreign tongues or provincial idioms, or the perversions of the faculty of language characteristic of mania and other forms of alienation, as these sounds are not intended to be, nor to appear, the vehicles of thought or manifestations of feeling. They stand in the same relation to the excitement and violence as the rapid motion, the furious gesticulation, and the tendency to injure and destroy everything that is seemly and harmonious. The tone in which they are uttered is generally harsh and defiant, because intense passion thrills through every muscle, through those of the vocal apparatus as well as of the arm raised to strike. Jargonizing is, in all probability, involuntary. It occurs at the commencement or crisis of mania, when the power to control the ideas and to regulate motion is most impaired. It may, however, be the result of volition, so far as that the individual desires and determines to speak, but fails from the rapidity or intensity of his emotions to call into action, and co-ordinate the organs engaged in articulation. Such utterances may be heard in soliloquy, if the phrase may be used, and during sleep. The feature has been accepted as pathognomonic of mania. It has, however, been noticed in the delirium of certain stages of fever and of drunkenness, which are mental states depending upon blood-poisons. During periods of profound abstraction, similar sounds are said to have proceeded from the lips of sane and healthy men. In all these instances the natural operation of the will would appear to be enfeebled or suspended.

JARNAC, BATTLE OF, was fought at the town of that name, in the department of Charente, France, March 13, 1569, between 26,000 Catholics under the duke of Anjou, afterwards Henri III., and 15,000 Huguenots under Louis prince of Condé. The latter were completely routed. See CONDÉ.

JAROSLAV, GOVERNMENT OF, one of the central provinces of European Russia; area, about 14,000 sq.m.; pop. in 1870, 1,000,748. The soil is generally not fertile; it hardly supplies the wants of the inhabitants, and forces them to be industrious, so that the province furnishes nearly the whole of Russia with the best carpenters, masons, smiths, etc. The staple industry is dressing, spinning, and weaving flax, which occupies more than 25,000 hands; mostly near Jaroslav, Uglitch, and Velikoe-Selo. In the northern districts of Mologa and Poshekhanje the whole population of many villages manufacture nails, springs, and other articles of hardware. The inhabitants of the Rostof district have the reputation of being the best kitchen-gardeners and fowl-breeders of the empire. The Volga crosses the government from w. to e., and gives a special impulse to its industry. The inhabitants are remarkably handsome both as to form and feature. The government is divided into nine districts.

JAROSLAV (pron. Yaroslaf), capital of the government of that name, in European Russia, is a large and fine t., situated on the right banks of the Volga and its affluent, the Kotorosl, in lat. $57^{\circ} 37' n.$, long. $39^{\circ} 53' e.$, at a distance of 164 m. from Moscow. It is one of the most ancient Russian towns, and is said to have been founded by Jaroslav the great in the 10th century. During the feudal period it was the seat of powerful feudal princes, and several times suffered from the invasions of the Mongols. The town has a vast *gostinodvor*, or market-place, nearly as lively as that of Moscow, and a quay on the Volga, about 2 m. long. Though possessing large stores of linen fabrics, flax, iron, flour, and grain, Jaroslav is but a second-rate commercial place on the Volga, the principal trade being concentrated at Rybinsk, 54 m. up the river, and at Rostof. Chemical works, principally of white lead and minium, constitute a sort of specialty of the town and its staple industry; next come several tanneries, extensive flour-mills on the Kotorosl, and a recently built cotton-mill of 40,000 spindles. The once celebrated silk, and especially linen and damask factories, are at present on the decline. The population of Jaroslav in 1867 amounted to 37,275 inhabitants, and is constantly increasing with the wealth of the town, owing to the development of steam-navigation on the Volga and the Kama. Jaroslav possesses a law college, founded in 1805.

JARROW, or YARROW, a t. in the co. of Durham, Eng., situated on the Tyne, and of importance for its manufactories and ship-yards; pop. 18,179. The old church of St. Paul possesses a chair which is said to have been used by the venerable Bede, who was buried in the churchyard, although later his bones were removed to Durham, and placed in the same coffin with those of St. Cuthbert.

JARVES, JAMES JACKSON, b. Mass., 1818; educated in Boston, but unable to go through a university course on account of impaired eye-sight. Having been appointed U. S consul to the Sandwich islands, he resided at Honolulu for a number of years, and established the first newspaper, the *Polynesia*, ever published there. He made an extensive tour through California, Mexico, and Central America, and also visited Europe. He did not, however, leave the Sandwich islands permanently until 1848. In the mean time he published several works which attracted attention, being written in a free and graphic style, while conveying much interesting information. These were: *History of the Sandwich Islands*, 1843; *Scenes and Scenery of the Sandwich Islands*, 1844; *Scenes and Scenery in California*, 1844. He also published, in 1855, *Parisian Sights and French Principles*, a series of brilliant and characteristic sketches. Mr. Jarves's *Art Hints*, which he afterwards enlarged and republished as *Art Studies*, was the first of his contributions to the literature of the fine arts. Having devoted himself to the collection of paintings illustrating the early schools of art in Europe, in a sequence, he was successful in bringing together a large number of fairly illustrative works, beginning with the Byzantine and reaching down through the middle age Italian, and the later French, Flemish, and Spanish schools. This collection, or such examples from it as were not privately disposed of, was deposited in the fine art gallery of Yale college. Since 1862 Mr. Jarves has resided in Florence, where he is recognized as a keen, skillful, and experienced art critic. His later publications have been the *Art Idea* and *Art Thoughts*.

JARVIS, ABRAHAM, D.D., 1739-1813; graduated at Yale, and was ordained in England by the bishop of Carlisle in 1764, becoming soon afterwards rector of Christ church, Middletown, Conn. He succeeded bi-shop Seabury as bishop of Connecticut, 1803. His work was important in the early history of the Protestant Episcopal church in Connecticut.

JARVIS, EDWARD, b. Mass. 1803, graduated at Harvard university. He was educated for the medical profession, and practiced for many years in Dorchester, Mass. He interested himself in the collection of vital statistics, and has written reports and monographs on various departments of this subject, among which are *Physiology and Health; Elementary Physiology; Reports on the Number and Condition of the Insane and Idiots in Mass.* He was for many years president of the American statistical association.

JARVIS, JOHN WESLEY, 1780-1840; b. England; was nephew of John Wesley, who took charge of him in infancy, on account of his father's frequent and prolonged absences, as a sea-faring man. At the age of 5 he accompanied his father on a voyage to America, and was left by him in Philadelphia. While obtaining a very meager education, he displayed at an early age remarkable talent for drawing, which decided his future career. He worked as an engraver in New York, painting profiles on glass in his spare time, and eventually became successful and popular as a portrait-painter in oil. He painted portraits of Hull, Perry, Bainbridge, Robert Morris, and other prominent men of his time, which are now in the city hall, New York, and the gallery of the New York historical society. He painted also in New Orleans and other southern cities, gaining great popularity, which would have become an established reputation but for his convivial and irregular habits.

JARVIS, SAMUEL FARMAR, D.D., LL.D., 1786-1851, son of bishop Abraham Jarvis. He graduated at Yale, was ordained 1810, and became a priest in the following year, and rector of St. James's church, New York, in 1813. He was also professor of biblical criticism in the General theological seminary of the Protestant Episcopal church. He removed to Boston in 1820, where he was rector of St. Paul's church for six years, at the end of

which time he traveled in Europe, visiting Italy, and remaining for some years in that country. He was a student of the eastern languages, and upon his return from Europe, accepted the chair of oriental literature, in Trinity college, Hartford. He was appointed historiographer of the American Episcopal church in 1838, and published *A Chronological Introduction to the History of the Church*. He wrote also, *No Union with Rome; The Church of the Redeemed; Sermons on Prophecy; and A Discourse on the Religion of the Indian Tribes of North America*.

JASHER. Book of (Heb. *Sepher ha-yashar*, "the book of the upright;" translated by the LXX. *Biblion tou Euthous*, and by the vulgate, *Liber Justorum*; but the Peshito [Syriac version] has *Sepher Hashir*, "Book of Praises or Hymns"), is one of the lost books of the ancient Hebrews, which is quoted twice (Joshua x. 13; 2 Samuel i. 18). Regarding its character and contents, there has been much speculation. Talmudic and later Jewish authorities identified it variously with Genesis (sometimes called "the Book of the Upright"), Deuteronomy, Judges, etc., to all which notions there is the obvious and fatal objection that the two quotations from it which survive are not to be found in any of these books, and could not possibly be found in the first two, as they refer to incidents which occurred at a subsequent period in the national history. The conjecture of the Syriac and Arabic translators has been adopted by Dr. Lowth, Herder, and other scholars, viz., that the book of Jasher was a collection of national ballads—a Hebrew minstrelsy, in short—recording the warlike deeds of the national heroes, or singing the praises of otherwise celebrated men. Gesenius is inclined to adopt the same view, and suggests that it may have acquired its name, "the Book of the Upright," from having been written chiefly in praise of upright men. Donaldson, in an ingenious work, *Jashar, or Fragmenta Archetypi, Carminum Hebraicorum in Masorethico Veteris Testamenti Textu passim tessellata*, contends for its being a composition of the age of Solomon, and a work of Nathan and Gad. He conceives that it originated in the desire of the more religious of the community to possess a record of the national history which should chiefly set forth the righteousness of the true Hebrews, and he attempts to extract from the so-called canonical books of the Old Testament such passages as he believed to have originally formed part of it. It must be added, however, that Dr. Donaldson's theory has met with little favor either from the mass of German scholars or from the few in England who are competent to consider the question.

JASMIN. JACQUES, the most eminent modern patois poet of France, and, in the words of his ardent admirers, "the last of the troubadours," was b. at Agen in 1798. He has given in his *Soubenis* a humorous account of his early life. According to it, he was of very humble birth, and was set to learn the trade of a hair-dresser, which agreed well with that of poet, as he himself says, because both are a kind of head-work. His poetry is full of beauty and power; the pathos of his serious, and the wit of his comic pieces, are unequalled, and both have been received with enthusiasm in France and other parts of Europe. He was made a chevalier of the legion of honor in 1846. Jasmin's principal works are *Me cal Mourir* (1825); *Lou Chalibari* (The Chorivari, 1825), a comic poem; *L'Abuglo de Castel-Cuille* (The Blind Youth of Castel-Cuille, 1836), translated by Longfellow; and *Las Papillots de Jasmin* (The Curls of Jasmin), of which the first part appeared 1835, and the second 1843. He died at his native town in 1864.

JASMINE, or JESSAMINE. *Jasminum*, a genus of plants of the natural order *jasminaceæ*. This order is allied to *oleaceæ*, and contains about 100 species of shrubs, some of them climbing, and many of them having exquisitely fragrant flowers. They are chiefly natives of the warm parts of Asia. Many belong to the genus jasmine, which has its calyx and corolla each 5 or 8-cleft, two stamens attached to and included within the tube of the corolla, and a two-lobed berry, one of the lobes generally abortive. The name jasmine is from the Arabic *yasmeen*. The COMMON JASMINE (*J. officinale*) is a native of the s. of Asia, but now naturalized in the s. of Europe, and as far north as the Tyrol and Switzerland. In more northern regions, it is much cultivated in gardens, but does not easily endure very severe winters. It is a shrub from 6 to 10 ft. high, with evergreen pinnate leaves, the terminal leaflet the largest, and very fragrant white flowers. The flowers were formerly employed in medicine, for strengthening the nervous system, but are now only used for preparing oil of jasamine, a delicious perfume. The commercial oil of jasamine, however, is not the pure essential oil, but merely oil of ben flavored with it, and is prepared by placing layers of the flowers alternately with layers of cotton soaked in oil of ben.—*J. grandiflorum*, a native of the East Indies, has flowers still more fragrant, from which, and from those of *J. sambac*, oil of jasamine is also made. The flowers of *J. sambac* are often scattered about in houses and temples in the East Indies, to diffuse their fragrance.—Several other species, some with erect, and some with twining stems, are not uncommon in gardens and green-houses. Some have white, and some have yellow flowers.—Oil of jasamine cannot be obtained from jasamine flowers by distillation.

JASMINE, or JESSAMINE (*ante*), one of the finest green-house species of jasamine is the *J. grandiflorum*, called in Europe Malabar jasamine, and in America Catalonian jasamine, easily trained upon trellises, and producing very fragrant flowers, with a pinkish tinge on the exterior, from which the oil may be obtained by the process of fatty absorption. The hardiest species is *J. nudiflorum*, whose yellow flowers appear early in the

spring, but they are devoid of odor. One of the most fragrant species is the *J. odora-tissimum*, which bears yellow flowers. The *J. sambac*, of which the florists have several varieties, is a very fragrant species, much sought for by bouquet makers. The jasmines are propagated by cuttings, in the manner of other green-house shrubs. The leaves of the *J. floribundum* are used in Abyssinia as a remedy for tape-worm.

JASMINE, or JESSAMINE, CAPE, a name popularly applied to plants belonging to the genus *Gardenia*, not related to the true jasmines. They belong to the madder family (*rubiaceæ*), and are tropical and sub-tropical shrubs. The genus was named by Ellis for Dr. Garden of Charleston, S. C., who was a correspondent of Linnæus. The best known species is *G. florida*, brought to England from China (not from the cape) in 1754. A double variety is a very popular greenhouse plant, and is common in the southern states as a hardy out-door plant. It bears a large, oblong, orange-yellow berry, which is said to be used in China as a dye.

JASMINE, or JESSAMINE, CAROLINA, or YELLOW, a climbing plant growing in Virginia and southward, clambering over trees and fences, bearing in profusion yellow, funnel-shaped flowers, an inch in diameter, and having a fragrance similar to that of the true jasmine, the odor, on a damp evening or morning, being almost overpowering. This plant is the *gelseminum sempervirens*, belonging to the family *loganiaceæ*. It has been recently used as a sedative, in medicine.

JASON, known as the tyrant of Pheræ, lived in the 4th c. B.C., and was assassinated in 370. He sought to reduce all Thessaly to submission, and was successful in conquering the chief cities. Created dictator of Thessaly, he entered upon a successful warlike career, and, had he not been cut off when at its height, would doubtless have achieved a lofty reputation as a general, rivaling even that of Philip of Macedon, whom he resembled in the comprehensive nature of his ambitious designs.

JA'SON. See ARGONAUTS.

JASPER (Gr. *iaspis*), a mineral generally regarded as one of the varieties of quartz (q.v.), and distinguished by its opacity, owing to a mixture of clay or other substances with the silica of which it is chiefly composed. There are many kinds of jasper, some of them of one color, as brown, red, yellow, green, white, blue, or black, and some variously striped, spotted, or clouded with different colors. Jasper is a very abundant mineral; it is found in veins and embedded masses in many rocks, sometimes appears as a rock of which whole hills are formed, and is very common in the shape of pebbles. It has been prized from the most ancient times for ornamental purposes, as it takes a high polish. Many kinds of it are very beautiful; and it can often be obtained in pieces of large size, so that it has been much used not only for rings, seals, and other small articles, but for the decoration of palaces. One of the best known kinds of jasper is found in Egypt, and is therefore called *Egyptian jasper*. It is generally yellow, prettily mixed with brown.—Jasper with very distinct stripes is called *ribbon jasper*.—The kind called *porcelain jasper* is rather rare. It is often full of minute holes, or is cracked in all directions. It is regarded as a kind of natural porcelain, formed by the action of fire.

JASPER, a co. in n.e. Georgia; 400 sq.m.; pop. '80, 11,849; is a rich agricultural district, though hilly, and produces corn, tobacco, and cotton. It has valuable mineral resources, particularly iron and gold. The Ocmulgee river forms its northern boundary, and it is watered by Cedar and Rocky creeks. Capital, Monticello.

JASPER, a co. in s.e. Illinois; 484 sq.m.; pop. '70, 11,234; is largely formed of prairie land, the soil being fertile and productive in wheat, Indian corn, and oats. The St. Louis, Vandalia and Terre Haute railroad to the Indiana state line crosses its n.w. corner. It is watered by the Embarras river. Capital, Newton.

JASPER, a co. in n.w. Indiana, having the Kankakee river for its northern boundary; 675 sq.m.; pop. '70, 6,354; is also watered by the Iroquois river. It is comprised, mostly, in prairie and marsh land, excellent for pasturage, while much of it is heavily wooded. Its productions are wheat, Indian corn, oats, hay, and potatoes; and there is a considerable and growing dairy industry. Capital, Rensselaer.

JASPER, a co. in s.e. central Iowa, watered by the Skunk river and its n. fork; 720 sq.m.; pop. '70, 22,116; is undulating in prairie and woodland, and has rich coal deposits. The soil is fertile, and it produces very largely of Indian corn, wheat, oats, and potatoes, and has valuable dairy industry. Capital, Newton.

JASPER, a co. in s.e. Mississippi, watered by the Leaf river and its affluents; 650 sq.m.; pop. '70, 10,884—4,898 colored; has undulating surface and fertile soil, and produces cotton, corn, and sweet potatoes. It is rich in cattle, horses, sheep, and swine. Capital, Paulding.

JASPER, a co. in s.w. Missouri, on the border-line of Kansas; 550 sq.m.; pop. '80, 32,021—772 colored; is watered by the Spring river, and has a fertile soil, productive of wheat, Indian corn, oats, and potatoes. This county has also a large dairy product, and some manufactures. Capital, Carthage.

JASPER, a co. in s.e. Texas, having the navigable rivers Neches and Angelina on the w.; 918 sq.m.; pop. '80, 5,778—2,538 colored; chiefly pasture land and timber, but produces rice, cotton, tobacco, Indian corn, and sweet potatoes. Capital, Jasper.

JASPER, WILLIAM, 1750-79, enlisted as a sergeant in a South Carolina regiment at the beginning of the American revolution, refusing a commission on account of his defective education. At the attack on fort Moultrie, June 28, 1776, Jasper distinguished himself by recovering, through an act of personal bravery, the colors of the defenders of the fort, which had fallen outside and were in danger of capture. On another occasion, aided by but one other person, he captured an entire British guard of 10 men, setting free the patriot prisoners whom they were conducting to Savannah. His daring act in this instance was recognized by the presentation, on the part of gov. Rutledge, of a handsome sword. Jasper fell mortally wounded at the assault on Savannah, while bringing off a stand of captured colors.

JASSY, the capital of Moldavia, the northern division of Roumania, is picturesquely situated on the slope of the Kopoberg mountains, near the borders of Bessarabia, and about 10 m. w. of the Pruth. It is irregularly built and dirty, and in its crooked streets the palatial mansion of the bojar—the Moldavian noble—alternates with huts of the most inferior description. It contains about 90 ecclesiastical edifices, one of which dates from the 14th century. On a height is the prince's court, formerly the residence of the governor of Moldavia. The streets are covered with dust in summer and with mud in winter, on which account conveyances are here in great requisition, and every one except the Jew and the mendicant employs a drosky. In Jassy there are 1300 private carriages, 5,000 droskies, and 12,000 horses. The manufactures of the town are few; there is, however, considerable trade in agricultural produce. Pop. 90,000, of whom many are Jews, Greeks, Armenians, and Germans.

JASZBERE NY, a considerable t. of Hungary, in the co. of Jasygia and Kumania, is situated on both banks of the Zagyva, 42 m. e. of Pesth. Pop. '69, 20,233, who are employed in agriculture and in the trade in corn, cattle, and horses.

JATAKA (literally, "relating to birth") is with the Buddhists the name of a work or a series of books containing an account of 550 previous births of Sâkyâ Muni, or the Buddha. Several tales that pass under the name of Æsop's fables are to be found in this collection of legends.

JATIVA, or **XATIVA**, SAN FELIPE DE, a t. of Spain, in the province of Valencia, 22 m. s. of the city of that name. Its climate is delicious, and the well-watered plain on which it stands is luxuriant in fruits and flowers. Its trade and manufactures are unimportant. Pop. 14,000.

JATS, or **JAUTS**, the name of a people of Hindustan, first mentioned in history at the beginning of the 11th century. They opposed the invasion of Mahmoud the Gazne vide, and are said to have gathered a fleet of as many as 8,000 boats in the Indus, where they were attacked by the invader and completely defeated. In the reign of Aurungzebe, the Jats appeared as banditti in the mountains in the interior of India. They increased in strength and daring, until they finally became formidable, and under their chief, Sooraje Mull, even dictated the policy of the Mogul court. The invasion of northern India by Ahmed Shah, sovereign of Cabul, put an end to the prestige of Sooraje Mull, who, after allying himself to the Mahrattas, deserted them before the battle of Panniput, and joined Ahmed Shah. His services on the occasion of this battle were rewarded by the possession of Agra and its district. At the time of the establishment of British power in northern India, the since celebrated Runjeet Singh was rajah of the Jats, and by a treaty with lord Lake, was permitted to remain in control of his territories without paying tribute. Disagreement between the English authority and that of the rajah brought about a conflict, and early in 1826 the almost impregnable fortress of Deeg, the stronghold of the Jats, was invested by a large force of British soldiers under lord Combermere. On Jan. 18 the fortress was stormed and captured, and the power of the Jats was at an end.

JAU'ER, an interesting old t. in Silesia, Prussia, situated on the Neisse, 10 m. s.s.e. of Liegnitz. The town is famous for its sausages; and there is a weekly corn-market, which has been regularly held since 1404, and is the most important in Silesia. Jauer was formerly a very prosperous town, being the only market for the linen trade of Silesia: but the thirty years' war reduced its extent and prosperity. Pop. '75, 10,404.

JAU'JA a city in the department of Junin, in Peru, is 108 m. n.e. of Lima; pop. 15,000. Until 1535 it was the capital of the vice-royalty of Peru. It is so beautiful in its position and surroundings that it is esteemed in that part of South America as an earthly paradise. The province of Jauja contains valuable silver mines.

JAUL'NA, a t. of India, in the Deccan, Nizam's dominions, situated on a gently sloping declivity, in a rugged country, 38 m. e. of Arungabad. It has a fort and cantonment for British troops. The climate is healthy, and favorable for the production of vegetables and fruits. On the opposite bank is the old town of Jaulna, now much decayed, but formerly large and flourishing, having enjoyed an extensive trade in grain and silks. It yet possesses to some extent a manufacture of silks for native use. Pop. 10,000, of whom about a fifth are Mussulmans.

JAUNDICE, a yellow color of the skin and conjunctiva of the eye, arising from the presence of the coloring matter of the bile in the blood and tissues, is a symptom of various disordered conditions of the system, rather than a special disease.

With this coloring of the skin and eyes the following symptoms are associated: the faeces are of a grayish or dirty-white tint, in consequence of the absence of bile, and the urine is of the color of the saffron, or is even as dark as porter, in consequence of the presence of the coloring matter of the bile. There is sometimes, but not in the majority of cases, an extreme itching of the skin. It is a popular belief, as old as the time of Lucretius—

Lurida præterea fiunt quæcunque tuentur arquati—

that to a jaundiced eye everything appears yellow. This, however, like the preceding, is only an occasional symptom.

The most obvious cause of jaundice is some obstruction in the gall-duets, preventing the normal flow of bile into the intestine. This obstruction may arise in any of the following ways: 1. It may be caused by the impaction of a gall-stone in the common hepatic duct. See LIVER. In this case, the jaundice is usually of short duration, and disappears soon after the gall-stone has passed into the intestine. 2. Another cause of jaundice is the obstruction of the gall-duets by cancerous disease of the head of the pancreas, by tumors in the liver, or by a diseased condition of the duodenum, the portion of small intestine into which the common hepatic duct opens. In these cases, the obstruction is usually permanent, and causes a persistence of the jaundice. 3. Obstruction or closure of the gall-duets sometimes occurs in the inflammation of the liver that is brought on by spirit-drinking, and sometimes may be caused by inflammation originating in the ducts themselves, which, from their small size, may be readily closed up by the inflammatory swelling of their mucous membrane. 4. The jaundice that occasionally rises from constipation, or that occurs during the advanced stage of pregnancy, is probably caused by pressure upon the common hepatic duct.

But although jaundice is frequently caused by some of these mechanical impediments to the flow of bile into the intestine, it results primarily and solely in a great number of cases from the secretion of bile being suppressed or deficient. The secretion may be suppressed so as to cause jaundice by a sudden mental shock or by continued anxiety. Various poisons in the blood may also suspend the secretion of bile to such an extent as to cause jaundice. It may be produced in this way by the salts of copper and of mercury, by opium, and by the poison of serpents; and it often occurs from the poisoned state of the blood in the course of fevers, especially the virulent fevers of tropical climates.

The prognosis in jaundice is generally favorable, except when it depends upon structural disease of the liver, or on mental shock or anxiety. The treatment must be chiefly guided by reference to the conditions which give rise to it in any particular case, and should never be attempted without professional advice.

JAUNDICE (ante). In the diagnosis it is noticed that the color of the skin in a sick person sometimes becomes so yellow or brownish-yellow as to lead to a belief in the reabsorption of bile, which is not the fact. The white of the eye is always more or less yellow in jaundice. In forming an opinion as to whether the hepatic disturbance is abating, as it must do before the jaundice diminishes or the discoloration of the conjunctiva begins to disappear, the sum of the symptoms must be taken into consideration, and particular attention must be paid to the examination of the faeces. Traces of bile, or rather of some of its constituents, particularly the coloring matter, or biliverdine, can usually, though not always, be detected when the liver is resuming its functions, or at least when the bile is flowing into the intestinal canal; therefore a reliance upon this test alone would sometimes lead to fallacy and the continuance of remedies no longer necessary, or perhaps injurious. The diagnosis in regard to the resumption of the hepatic function of biliary secretion must take into consideration the physical examination of the hypochondriac region, and the general character of any alterations in the character of the faeces, and the sensations of the patient. See LIVER.

JAVA (Djawa), "the Queen of the Eastern Archipelago," a most valuable colonial possession of the Netherlands, is situated in lat. $5^{\circ} 2'$ to $8^{\circ} 50'$ s., and long. $105^{\circ} 12'$ to $114^{\circ} 39'$ east. It is washed on the n. by the sea of Java, on the e. by the strait of Bali, on the s. by the Indian ocean, and on the w. by the strait of Sunda. The extreme length from e. to w. is 666 m., the breadth varies from 56 to 136 m., and the superficial area is reckoned at 50,260 sq.miles. The island is hilly, and cut in many parts by deep gorges and rushing streams. The mountains rise to a height of from 4,000 to 10,000 ft., and are clothed to their summits with luxuriant foliage. Thirty-six of the lofty mountains are volcanoes, of which eleven are still active.

In 1874 the population of Java and Madura (q.v.) amounted to 18,125,269, having more than trebled in 45 years. The census gave 48,522 Europeans, 305,897 Chinese, 13,083 Arabians, and 19,518 Hindus, etc. The Javanese belong to the Malay (q.v.) race, and are mostly Mohammedans; the remainder being "heathen," whose religion is a degraded superstition. In moral habits and civilization the Javanese are superior to the inhabitants of Sumatra and Celebes. There are 29 Dutch Protestant and 10 Roman

Catholic clergymen, all paid by the government, which fixes their sphere of labor, and strictly prohibits proselytizing. They chiefly labor among the Europeans, half-castes, and intermediate races at the ports, and the natives of the interior are neither made acquainted with the Christian religion nor with European education. The Javanese are much addicted to smoking opium, which is not permitted to be grown on the island, the government importing the quantity considered necessary, and granting licenses for its sale, realizing therefrom an annual revenue, which, in 1871, amounted to £832,308 sterling.

For upwards of 40 years Java has been steadily advancing in prosperity. Its producing power is only limited by the amount of available labor, and notwithstanding the energy which the Dutch have displayed in increasing the breadth of cultivated land, the greatest part of the island is still in a state of nature. Rice is grown extensively for native consumption and exportation; sugar, coffee, indigo, tea, tobacco, etc., for export. The increase in the trade of Java has been great and rapid. In 1848 the imports amounted to the value of £2,666,765; the exports to £4,510,472. In 1874 the imports were valued at £3,739,720, of which £125,760 were in specie: the exports were £5,768,480, of which £18,400 were in specie.

The countries which trade most extensively with Java are the Netherlands, Great Britain, China, and Japan. In the trade reports for 1860 Holland is set down as having imported into Java merchandise to the value of £1,864,740, and specie to the value of £1,511,854; while Great Britain sent goods to the value of £991,155. In the same year the exports from Java to Holland amounted to £6,403,553, and those to Great Britain to £58,135. This great difference arises from the largest proportion of the products of the island being the property of the government, and managed, stored, shipped (exclusively in Dutch ships), and sold in Holland by the Netherlands trading company, whose profits arise from the commission allowed on the transactions. The import and export duties are very high, but much modified in favor of the Netherlands. The leading articles imported into Java are cotton and linen goods, wine and spirits, machinery, provisions, etc.; the principal exports are sugar, coffee, indigo, tea, rice, etc. In 1860 sugar was exported to the value of £2,751,998; coffee, £2,535,830; indigo, £293,363; rice, £562,185. Some years the exports of these articles reach a considerably higher figure. In 1870 the produce was 983,634 piculs of coffee (of 133 $\frac{1}{3}$ lbs.); 46,104,200 piculs of rice; 2,191,466 piculs of sugar; and 1,974,676 lbs. of tea.

The island is divided into east, west, and middle Java, containing 22 subdivisions, called residencies, over which a superior European official, the resident, exercises general control, and acts as judge, collector, and magistrate. The resident has European assistants, who perform the same functions in districts of the residency; and native agency is also extensively employed in the government service, all the chiefs being either present or expectant salaried servants of the colonial government, actually engaged, under European superintendence, in ruling the masses. The chief native official of a district is the regent, selected from the family of the former local prince, and retained in office so long as he promotes the interests of the government.

The material prosperity of Java is owing in a great measure to the energy with which the Dutch government has extended the growth and manufacture of those articles which form its staple exports. By an elaborate and skillfully worked-out system of culture, introduced in 1830, the growth and preparation of the staples for exportation have advanced with amazing rapidity. The cultivators of the soil, the native chiefs, the European officials, and the government all share in the profits, and work harmoniously together in developing the capabilities of the land. In carrying out the extensive mercantile transactions which the culture-system involved, the government has been ably assisted by the Netherlands trading company, and the result has been the changing a burdensome colony into a mine of wealth. Between 1824 and 1833 the expenditure exceeded the income. From that time the finances of Java have been prosperous, and the colony has transmitted to the Netherlands since 1838 a sum not short of £30,000,000 sterling. In 30 years the revenue rose from an average of £2,500,000 sterling to £9,500,000 in 1857, in which year the net surplus was £3,500,000; since then a more liberal policy has been followed, and the surplus has decreased. Railways are being constructed, and from 1867 to 1875, 165 m. were opened.

Climate.—With the exception of some marshy districts on the n. coast, the climate of Java is healthy and pleasant. On the coasts the thermometer seldom indicates more than 93° F. during the dry, and 84° in the rainy season. The average is 80° at noon, and 70° in the evening. The heat is moderated by the sea-breezes, which constantly blow across the island. Along the high lands of the interior the air is not only breezy, but sometimes cold, the thermometer frequently falling to 45°; and as the entire island is intersected with excellent roads, it is not difficult to reach the most beautiful and salubrious districts. Inland of Semerang, at an elevation of 4,000 ft., Europeans enjoy a pleasant retreat during the dry season.

History.—The history of Java, previous to the 14th c., is involved in fable and obscurity. It appears, however, that the Javanese, from a very early period, possessed a considerable degree of civilization, which was probably the result of the labors of Brahmanical teachers from Hindustan. It is impossible to say precisely when Hindu civilization and religion were introduced into Java, though it must have been very early

in the Christian era. Buddhism was superadded; and there are many old Buddhist temples scattered throughout the island, memorials of the former prevalence of that religion. The most famous is that called Boro Buddor (q.v.). Towards the close of the 14th c., Mohammedanism found a footing in the eastern provinces; and in 1475, the Hindu empire was overthrown, and Mohammedanism became the faith of the country; yet as late as 1511, when the Portuguese first visited Java, they found a Hindu king in Bantam. In 1595 the Dutch sent out an expedition under Houtman, who, on arriving at Bantam, found the king at war with the Portuguese, and offered him assistance, obtaining in return permission to build a factory. In 1677, after many contests with the native princes, the Dutch obtained extensive territories and important trading concessions. In 1811, when Holland became incorporated with France, the British took possession of Java, which, after five years' occupation, was restored to the Dutch. A long and bloody war ended in the whole island becoming virtually a Dutch province in 1830, though two states are still nominally ruled by native princes. Slavery was totally abolished in the island Sept. 20, 1859, by the legislature of Holland.—See Sir Stamford Raffles's *History of Java* (2 vols. London, 1817); Crawford's *Eastern Archipelago; Java, or How to Manage a Colony*, by J. W. B. Money. See NETHERLANDS TRADING COMPANY. On Jan. 1, 1874, the pop. of the residencies or governmental divisions amounted to:

RESIDENCIES.	Natives.	Europeans.	Chinese.	Arabs, etc.	Total.
Bagalen	1,151,145	441	2,549	106	1,154,241
Banjoemaas	916,005	456	3,567	154	920,182

Madura, Island of	719,238	478	5,547	6,058	731,221

In 1864 the pop. of Java and Madura was 13,917,368; in 1874 it had risen to 17,786,118.

Banjoewangi, Buitenzorg, Krawang, and Patjitan are assistant-residencies; Djokjokarta and Surakarta are called the Vorstenlanden (lands of the princes), the former having a native sultan, the latter an emperor, who are vassals of the Dutch.

On June 10, 1867, an earthquake caused the loss of about 300 lives and a vast amount of property in several of the residencies, especially in Djokjokarta. The mountains are chiefly volcanic. The highest are Sméru or Mahaméru, in the residency of Pasocroewan, which is 12,250 ft. high, and Slammat, in Tagal, 11,320. Sulphur, almost pure, is abundant.

Bagalen is one of the most fertile residencies, and produces coffee, indigo, tea, cinnamon, rice, tobacco, sugar, maize, cotton, cocoa-nuts, and a great variety of fruits. The forests contain much fine teak. Besides agriculture, the principal industries are weaving, dyeing blue, rope-spinning, making pottery, nets, paper, and mats. In 1874 there were belonging to the government, 17,333,011 coffee-trees, producing 47,526 cwts. of coffee. Tea and cinnamon are also largely grown, and indigo manufactured.

Banjoemaas (oe pron. *ā*) is very mountainous towards the n. and n.e. Banjoemaas, the capital of the residency, situated in a valley on the left bank of the Serajo, in 109° 19' 20" e. long., and 7° 33' 45" s. lat., is a regularly-built town.

Banjoewangi, an assistant-residency, in the eastern part of the island, is mountainous, well wooded, and fertile. The forests abound in fine timber-trees. Banjoewangi, the capital, lies on the strait of Bali, in 114° 26' e. long., and 8° 12' 40" s. lat., and is a beautiful little town of 8,000 inhabitants.

Bantam, a residency in the w. corner of Java, is low and marshy on the n. coast. Towards the interior, it gradually becomes mountainous, with the most beautiful valleys between the heights. The s. coast is wild and rocky, and on the w. side are impassable wildernesses, swarming with wild beasts. The soil is generally fertile, producing the usual crops of the island. Bantam, the former capital of the once powerful kingdom of that name, is now little more than a village, in which the remains of former grandeur are

to be seen. The resident has his seat at Serang, a large village, in $106^{\circ} 8' 37''$ e. long., and $6^{\circ} 6' 45''$ s. lat.

Bezoeki, on the e. coast, is mountainous, and clothed with a luxuriant vegetation.

Buitenzorg, an assistant-residency, is very healthy, and often has a favorable influence on the sick from other districts of Java, especially of Batavia, to which it is contiguous. Buitenzorg, the capital, is 883 ft. above the sea-level, and is one of the most pleasant places in the island.

Cheribon is a very extensive and beautiful residency, and derives its name from that of the capital, which is a corruption of Tji-ribon, or river Ribon, on which it is built. Cheribon, the capital, in $108^{\circ} 38'$ e. long., and $6^{\circ} 45'$ s. lat., was once a flourishing place, but has been for some time retrograding.

Djokjokarta produces the usual crops. The natives are much addicted to the use of opium. The productive power of the population is therefore less than in other districts of the island. Djokjokarta, the capital, is situated on the right bank of the Oepak, in $110^{\circ} 21' 30''$ e. long., and $7^{\circ} 46'$ s. lat., at the s.s.w. base of the mountain Merapi. The city is large, and regularly built. It is the seat of the sultan, the resident, and assistant-resident. Pop. 50,000, of whom 600 are Europeans.

Japara, on the n. coast, has a very warm climate in the interior, and though vegetation is in general luxuriant, yet scarcity of water is sometimes felt. The resident has his seat at Pati, in $110^{\circ} 56' 7''$ e. long., and $6^{\circ} 45' 30''$ s. lat., which is regularly built, and has a pop. of 10,000.

Kadoe—i.e., hollow—is a large basin formed by lofty mountains, of which Soembing is 10,911 ft. high, and the Sindoro 10,812. It is one of the smallest residencies of Java, but densely peopled. Its fertility is increased by the abundance of water flowing from the surrounding mountains. The amount of coffee produced is very great; in 1874 the fruit-bearing trees numbered 32,903,125, producing 90,271 cwts. of coffee. Beautiful marble is found in great quantities. The capital is Magelang, situated on the e. bank of the Progo, in $110^{\circ} 10' 7''$ e. long., and $7^{\circ} 29'$ s. lat. Pop. 34,000.

Kediri consists of a plain bounded by mountains on the n., e., and west. The navigable river Brantas, which flows through a great part of the residency before falling into the sea of Surabaya, affords great trading facilities. The people, however, are low in the scale of activity and morality, which may partly result from Kediri having been, under the former Javan princes, a penal colony. They are greater slaves to opium than any other people in the Indian Archipelago. Kediri, the seat of the resident, is situate on the right bank of the river Kediri, 600 ft broad, which higher up is called the Brantas. The streets are broad and planted on both sides with tamarind trees.

Pasoeroewan, which is washed by the strait of Madura, has important fisheries, and is famed for its race of horses. Pasoeroewan, the capital of the residency, is situated near the sea, on the river Gemboug, in $112^{\circ} 55' 2''$ e. long., and $7^{\circ} 38' 40''$ s. lat.

The Preanger regencies are partly occupied with mountains, forming two chains. Between these are many extensive valleys of the richest soil. The mountains are of basalt. There are many rivers, of which five are navigable. The numerous lakes give good supplies of fish and water-fowls. The bays on the coast are also frequented by fishing-boats. The mountains are covered with coffee plantations to 3,000 ft. above the sea-level, while the low and marshy grounds produce rice abundantly, and the villages are hid with cocoa-nut palms and other fruit-trees. In no other residency is the tea-culture so extensive. The forests produce good timber, the bamboo attaining a height of 80 feet. There are rhinoceroses, tigers, harts, wild swine, etc., and birds of great variety and beauty. The natives are honorable, simple, and obedient, and subsist from the growing of coffee, rice, fruits, etc., the rearing of horses and buffaloes, making spinning-wheels, mats, gold and silver work, etc. The women weave very beautiful cotton cloth. Coffee and tea, and, later, also cinchona, are the only products raised for the government.

Probolinggo, in 1874, produced 400,686 cwts. sugar and 43,359 cwts. coffee. Forests containing many teak trees cover the s. coast. There are tigers, wild dogs, monkeys, squirrels, etc. Probolinggo, the capital, lies on the coast, in $109^{\circ} 21' 45''$ e. long., and $7^{\circ} 23' 22''$ s. lat., and is extensive and populous. From this port much of the produce of the land is shipped for the Netherlands.

Rembang produces the usual crops. The northern parts are dry and sandy; and in the s. are extensive forests, abounding in teak and other valuable timber trees. The residency is washed by the Java sea, and the people on the coast find their living by trade, fishing, and ship-building. Rembang, the capital, is regularly built, and besides the public offices, has a small Protestant church, a government school, and an institution for the education of girls.

See SAMARANG, SURABAYA, and SURAKARTA.

Tagal is very fertile. It is washed on the n. by the Java sea, and the fisheries are important. In the s. of the residency is the volcano Slamat, 11,220 ft. high, which is clothed with forest to the height of 8,500 ft., and on the southern side descends by regular terraces to the bed of the river Serajoe. Tagal, the capital, is a small but neatly-built town, with a considerable coasting trade. The natives are industrious and good handcraftsmen.

JAVANESE LANGUAGE AND LITERATURE. Two languages, possessing many words in common, but differing in essentials, are spoken in Java, the Javanese and the Sunda. From the earliest times Javanese has been a written language, and its alphabet has extended to the Sunda language. Inscriptions on stone and metal are in existence, which date back to the 12th century. The early characters differ from those now in use, but not more than black letter from modern type. They are in every particular dissimilar from those of the Hindu or Archipelagic alphabets. They appear to be entirely original, invented by the inhabitants themselves. In the Javanese grammar the consonants alone are considered substantive letters, the vowels being merely intended to modify, or, as the people themselves say, "clothe" them. There are 19 consonants, but the vowel *a*, as an initial, is considered a substantive letter. The same vowel is included in every consonant, and follows every one also, unless a contrivance is employed to cut it off. Apart from *a* there are 5 other vowels. Every sound in the language has its representative character, and each letter has its own peculiar power, and no other.

The foreign elements in the Javanese languages are: Sanskrit, Arabic, Telugu, or Telinga, which have become incorporated with it, not by foreign conquest or intermixture of race, but through religion and commerce. Of these, Sanskrit is the predominant. We have no clue to the influx of the Hindu sacred language into the Javanese tongue, but it must have been incidental to the conversion of the Javanese to Hinduism, and probably of very great antiquity. There are three dialects of the Javanese language: the vulgar, the polite, and the ancient or recondite. It is far more polished than the Sunda, which, although now written in the Javanese with the omission of the palatal *d*, and *u t*, had formerly a character peculiar to itself. The Javanese boast a very considerable literature in both the modern and the ancient tongues. In both it is metrical, the ancient showing many indications of Sanskrit poetry; and the modern abounding in stanzas of various kinds, and in a peculiar rhyme, which are entirely original. Romances and romantic histories are very popular; and abstracts of the Sanskrit poem which describes the wars of the Pandus and the legends of Rama are to be met with. These are to the Javanese mind what Homer's poems were to the Greeks. Original Javanese poetry possesses little originality or force, but it is superior to that of any other people of the Archipelago. Oriental scholars are interested in the prevalence of Indian legends. The *Ramayana* is identical with the *Ramajana* of the Hindus, and in their *Gastrā manava* we recognize the fundamental principles of Manus's book of laws. Several books have been translated into Javanese, amongst others *The Thousand and one Nights*. There is a Javanese newspaper. One peculiarity of the language should be noticed, it affords special forms and flexions for addressing particular persons, having regard to their rank. In speaking to servants, the mode of addressing them is called *basa noko*, or simply *nokō*, or commanding; and in speaking to superiors, the servants in turn use *basa krama*, or *krama*, humble speech. Then, for those who occupy no especial position, there is the *basa madya*, or middle speech; and lastly the *basa kraton* or court language is used to kings or their envoys.

JAVELIN, a short and light spear used for darting against an enemy. In the Roman legion, the first and second lines (the hastati and the principes) were both armed with two javelins to each man. Each javelin (Lat. *pilum*) was in all about $6\frac{1}{2}$ ft. in length; the shaft $4\frac{1}{2}$ ft. long, of tough wood, an inch in diameter; and the remainder given to the barbed pyramidal head. In action, the legionary hurled one javelin on the enemy at the first onset; the second he retained as a defense against cavalry. The Goths and other barbarians used a javelin.

JAWO'ROW, a t. of the Austrian empire, in the province of East Galicia, 28 m. n.w. from Lemberg, on the Krakowska, an affluent of the San, which itself is a branch of the Vistula. Close by the town is a lake, abounding in fish. Jaworow is built in the form of a square, and has extensive suburbs. It has mineral springs. Near it are large paper-mills. Many of the inhabitants are Jews. Pop. '69, 8,699.

JAXAR'TES, now called SIHŪN, or SIR-DARIA (i.e., Yellow river), a river of Turkistan, which rises in the high plateau s. of Lake Issikul, in the Thian Shan mountains, flows in a westerly direction through the valley of Khokan, receiving in its course numerous accessions; after passing Otrar, it divides into two branches; the largest and most northerly retaining the name Sir-Daria, flows west-by-north, separating the Russian territory from the steppes of Turkistan, and, after a course of 1150 m., falls into the sea of Aral; the lesser branch, called Kuvan-Daria, flows westward, supplying some small lakes in the line of its old channal, but for several years back has not reached the sea of Aral, though sixty years ago it had a greater volume of water than the Sir-Daria.

JAY, *Garrulus*, a genus of the crow family (*corvidæ*), differing from magpies chiefly in the rather shorter bill, and in the shorter and rounded, or sometimes almost even tail. They are inhabitants of forests and wooded districts, chiefly in the temperate parts of Europe, Asia, and North America; and feed more on fruits and seeds than crows and magpies generally do; but they have the omnivorous character of the rest of the family, and often rob the nests of other birds, whether containing eggs or young.—The COMMON JAY (*G. glandarius*) is a well-known native of England and of the s. and middle of Scotland, although less common than it once was, in consequence of the incessant war which

has been waged against it, both by gamekeepers and by the legislature itself; an English statute of the 17th year of George II. having empowered grand juries to offer threepence for the head of each jay, on account of alleged injury done to young trees. It is rather smaller than a jackdaw; the plumage is mostly ash-gray, finely tinged with red or purple, the quill-feathers and tail mostly black, a beautiful mottled patch on each wing rayed with bright blue, a broad mustache-like stripe of black extending for an inch from the base of the lower mandible on each side; the head is furnished with a crest of erectile feathers, each of which has a streak of black in the middle. Jays are most frequently seen solitary or in pairs. They build in thick trees or bushes, and their nest is a basket-like structure of small sticks, lined with fine roots and grasses; the eggs, five or six in number, are yellowish-white, minutely and thickly speckled with light brown. When taken young, the jay is very easily tamed, becomes very familiar and amusing, and perhaps excels all other British birds in its power of imitating voices and sounds.—The BLUE JAY (*G. cristatus*) of North America, a species abundant from the Gulf of Mexico to Canada, is smaller than the common jay; it has a similar crest or tuft on the head, and a longer and more rounded tail. The general color of the upper parts is bright purplish-blue; the wings and tail white, barred with black; the neck surrounded with a curved black collar. It is more gregarious than the common jay, and partially migratory.—The CANADA JAY, or CARRION BIRD (*G. Canadensis*), is a more northern American species.—Other very beautiful species are found in the n.w. of America, Mexico, and the Himalaya mountains.

JAY, a co. in e. Indiana, watered by the Wabash and Salamonie rivers; 370 sq.m.; pop. 77, 1500. It is traversed by the Pittsburg, Cincinnati and St. Louis, and the Richmond and Fort Wayne railroads. Co. seat, Portland.

JAY, JOHN, an American statesman and jurist, and first chief-justice of the supreme court of the United States, was b. in the city of New York, Dec. 12, 1745. He graduated at King's, now Columbia college, New York, in 1764, and was admitted to the bar in 1768. He took a moderate and conciliatory part in the American revolution, was a member of the congress of Philadelphia, was president of congress in 1778, and minister to Spain in 1779. He was very influential in negotiating the treaty of peace, and it was, according to lord St. Helens, "not only chiefly, but wholly by his means that it was brought to a successful conclusion." He wrote a portion of the *Federalist*. His services to the federal party were deemed so great that Washington offered him his choice of the offices in his gift, and he selected that of chief-justice. He resigned, and became governor of New York, and in 1794 minister to England. On the defeat of the federal party he retired from public life, and lived in great seclusion, only taking part in religious, peace, temperance, and antislavery movements. He died at Bedford, New York, May 17, 1829.

JAY, JOHN, LL.D. (*ante*), descended from the Huguenots of La Rochelle, France, who fled their country on the revocation of the edict of Nantes. He gained high repute as a lawyer, and powerful political influence, and was the author of the important *Address to the People of Great Britain*, which was one of the early documents issued by the American patriots. He was a leading and influential member of the convention of the state of New York, 1776, and afforded valuable assistance in framing the constitution. He was chief-justice of New York, and a member of the council of safety. In 1778-79 he presided over congress, and was then sent to Spain on a special mission. From 1795 to 1801 he was governor of the state of New York, and it was under his administration that slavery was abolished in the state.

JAY, JOHN, b. New York, 1817; son of William Jay; was educated at Columbia college, graduating in 1836, and commencing practice at the bar in 1839. He was for some years prominently connected with the New York historical society, and other important literary or political organizations, and has published many pamphlets and reports upon public questions. In 1869 he received the appointment of U. S. minister to Austria, and held the position until 1875.

JAY, WILLIAM, an English Independent or Congregational minister, of much celebrity for his pulpit eloquence, and as a voluminous writer of devotional, practical, and other religious works. He was born, May 8, 1769, at Tisbury, in Wiltshire. His father was a stone-cutter and mason, and young Jay's first employment was that of a mason's boy; but whilst still young he was sent to Marlborough academy, an institution of the Congregationalists for the training of young men for the ministry. According to a custom prevalent amongst the Congregationalists, he was sent out to preach in country villages almost in his boyhood—in fact, before he was 16 years of age. His education being completed, he officiated for a year in a chapel at Clifton; and in 1791 was settled as pastor of a "church" in Bath, which position he occupied for 62 years. He retired from it in Jan., 1853, and died Dec. 27 of the same year, at the age of 84. Mr. Jay's published works, in general, attained to a rapid and very extensive popularity. Among them are sermons, family prayers, *Morning and Evening Exercises*; *Mornings with Jesus*; an essay on marriage; memoirs of the rev. Cornelius Winter; memoirs of the rev. John Clark; lectures on female Scripture characters; and an autobiography. A collected edition of his works, in 12 vols., revised by himself, was published in 1841, but is of course incomplete, some of his works being of more recent date.

JAY, WILLIAM, LL.D., 1789-1858; b. New York; son of John Jay; distinguished by his philanthropic schemes, and devotion to temperance, antislavery, and anti-war. He was educated for the legal profession, and was successively judge of the court of common pleas in New York, and first judge of Westchester co., N. Y., retaining the latter office during 22 years, being finally requested to resign on account of his anti-slavery opinions. In 1842 he interested himself in the American antislavery society, when the question arose in congress of restricting freedom of speech upon the subject of abolition, and published a work, *Inquiry into the Character of the American Colonization and Antislavery Societies*, in which he ably discussed the question. In 1843-44 he visited Europe, and proceeding to Egypt thoroughly investigated the question of Egyptian slavery. He was president of the Peace society for many years, and published *War and Peace—the Evils of the First and a Plan for Supporting the Last*. His largest work was *Life and Writings of John Jay*. He left \$1,000 by his will for the "promotion of the safety and comfort of fugitive slaves." Died in Bedford, N. Y.

JAYADE'VA, the name of a celebrated Hindu poet, who, according to some, lived about the middle of the 11th, according to others about the middle of the 16th c., after Christ. His great work is the *Gītagorīndā*, an erotic poem in honor of Krishna, an incarnation of Vishnu, and his wife Rādhā, interpreted in a literal and mystical sense.

JAZYGES, one of the numerous tribes which, during the early Roman empire, were comprehensively named Sarmatians. They originally occupied the shores of the Black sea, and sea of Azov. The origin of the name Jazyges, as applied to one particular branch of this people, is to be found in the history of their division, in the time of the emperor Claudius, into three distinct parties, settling respectively on the Don, the Dniester, and the Danube. The last named craved the protection of Rome, and were called by them the Jazyges Metanastæ, or transplanted. At the invasion of the Magyars they became dispersed as a distinct people, but later on reappeared, and selecting a district of Hungary, established a colony under the name of Jazygea, which, in our own day, is under the administration of the Palatinate. Its capital is Jászberé'u, and it has an area of 400 sq. miles. Pop. '70, 215,526.

JEANNETTE EXPEDITION. See POLAR EXPEDITIONS.

JEANRON, PHILIPPE AUGUSTE; b. Paris, 1809; has distinguished himself as a painter and author. He was mainly self-educated, and first attracted attention by his "Little Patriots," and "Twelve Episodes in a Proletarian Life," which he painted at the suggestion of Ledru-Rollin. He had the direction of the national museums of France from 1848 to 1850, and was afterwards in charge of the museum of Marseilles. Of his publications the best are *Histoire de l'Ecole Française* and *De l'Art de la Peinture*.

JEBAIL', or JUBEIL, a t. in Syria, near Mt. Lebanon, 20 m. from Beyrouth; pcp., 600. It is said to be the site of the ancient city of Byblos (q v.), and was captured by the crusaders during their wars, its harbor being then destroyed. In 1840, the English wrested it from Mehemet Ali.

JEBB, Sir JOSHUA, 1793-1863; was an eminent British officer, who first attracted attention when intrusted with the direction of a government inquiry and experiments to improve the condition of convicts in Australia. He managed the matter so ably that he was consulted as to the best remedy for the evils of the prevailing convict system, and in accordance with his views, the system of solitary confinement was established in England, and the great prison at Pentonville built after his designs. He was knighted for his services, and made inspector-general of prisons, devoting the remainder of his life to improving the penal laws and the discipline of jails.

JED'BURGH, an old t., and royal and parliamentary burgh of Scotland, capital of the co. of Roxburgh, is beautifully situated on the left bank of the Jed, 14 m. e.s.e. of Selkirk, and 40 m. s.e. of Edinburgh. Jedburgh has been greatly improved in recent years, many fine new buildings having been erected. The most interesting architectural feature of the town is the remains of the magnificent abbey of Austin canons, founded by king David I., about 1130. Of this structure, the church (230 ft. long) alone remains. The abbey was rifled and burned in 1523 by the earl of Surrey, and again by the earl of Hertford in 1544. To preserve it from threatened ruin, the abbey, a few years ago, was extensively repaired, with judicious regard to its ancient architectural features. The present jail occupies the site of a castle in which Malcolm the Maiden died, and William the Lion, Alexander II., and other Scottish kings frequently resided. The principal manufactures of Jedburgh are blankets, flannels, shawls, plaids, and hosiery. Pop. '71, 3,321.

Jedburgh appears in record as early as the 9th century. Between the years 829 and 854, Egred, bishop of Lindisfarne, whose diocese then extended to the n. of the Tweed, built two towns at Jedburgh. One of these is now represented by the hamlet of Old Jedburgh; the other by the town of Jedburgh, which was made a royal burgh in the reign of David I. Situated on the border, its inhabitants were a warlike race, whose slogan, "Jeddart's here!" was seldom long silent. Their chief weapon was the "Jeddart axe," or "Jeddart staff," a stout pole 4 ft. long, with a steel head.

JEDDO, or JEDO. See TOKIO.

JEEJEEBHOY, Sir JAMSETJEE, a Parsee merchant-prince and philanthropist, was b. of poor parents at Bombay, July 15, 1783. At an early period, he showed a great aptitude for mercantile pursuits, and in consequence, his father-in-law, Framjee Nusserwanjee, a Bombay merchant, took him into partnership. While still a young man, he visited most of the maritime countries of Asia, besides Egypt, Syria, and England. After he had become chief partner in his father-in-law's firm, the wealth of which rapidly and prodigiously increased, Jeejeebhoy kept his eye on the progress of political events in Europe; and when peace was restored there after the fall of Napoleon, the Indian trade was so much benefited that, from 1814 to 1819, the value of the imports from Europe rose from £870,000 to £3,052,000—in which increase, we are informed, "the house of sir Jamsetjee and his father-in-law enormously participated." By the year 1820, when he had completed his 20th year of business, he had amassed an immense fortune, and was universally acknowledged to be the first merchant in the East. He now began to exhibit, on a magnificent scale, his liberality of spirit and love of his fellow-creatures. His contribution to the Jamsetjee Jeejeebhoy hospital was 160,500 rupees; his endowment of the Parsee benevolent institution, 440,000 rupees; the Mahim cause-way, built by him, cost 150,500 rupees; the Dhurumsalla, or poor asylum, 150,000 rupees; the water-works constructed by him at Poona cost 180,000 rupees; and the endowment of the Jamsetjee school of industrial arts, 100,000 rupees. Altogether, between the years 1822 and 1858, sir Jamsetjee Jeejeebhoy spent "upwards of a quarter of million pounds sterling in founding, endowing, or supporting undertakings of a purely benevolent character." Parsee and Christian, Hindu and Mussulman, were alike the objects of his splendid and magnanimous beneficence. At length the fame of his munificence reached the ears of queen Victoria, who conferred on him the honor of knighthood. Other honors followed; and in 1857 he was made a baronet of the United Kingdom. He died April 15, 1859, and was succeeded in the baronetcy by his eldest son, Cursetjee Jamsetjee Jeejeebhoy, who, in accordance with his father's will, took his father's name. He, again, was succeeded in 1877 by his son Manekjee, who also assumed the name of the first baronet.

JEFFERSON, a co. of n. Alabama, in the coal regions; 980 sq.m.; pop., 12,345. Surface, rough and hilly, but with productive valleys. The staple productions are, corn, cotton, and wool, and there are manufactures of iron. Co. seat, Elyton.

JEFFERSON, a co. in s.e. Arkansas, watered by the Arkansas river; 900 sq.m.; pop. '70, 15,733. It is fertile and well timbered, and produces corn and cotton. Co. seat, Pine Bluff.

JEFFERSON, a co. in Colorado, situated among the foot-hills of the Rocky mountains; 800 sq.m.; pop., 2,390. The land requires irrigation for farming purposes, but is excellent for grazing, and abounds in coal, iron, and fire-clay. It is traversed by the Colorado Central railroad. Co. seat, Golden.

JEFFERSON, a co. in Florida, stretching from the Georgia frontier to the gulf of Mexico; 470 sq.m.; pop. '80, 16,065. It is wooded, and the soil is easily cultivated and fertile. The staple products are cotton, sugar, rice, and fruit. Co. seat, Monticello.

JEFFERSON, a co. in e. Georgia, drained by the Ogeechee river; 634 sq.m.; pop. '80, 23,251. The surface is generally level, and the soil fertile. It is traversed by the Central railroad of Georgia. Co. seat, Louisville.

JEFFERSON, a co. in s. Illinois; 530 sq.m.; pop. 17,864. It is varied by prairie and woodland, and the soil is generally fertile; the productions being grain, tobacco, wool, and live-stock. This county is intersected by the St. Louis and South-eastern railroad. Co. seat, Mt. Vernon.

JEFFERSON, a co. in s.e. Indiana, having the Ohio river as its southern boundary; 362 sq.m.; pop. 29,741. The surface is varied in character, the soil generally fertile; staple products: cattle, grain, and wool. Co. seat, Madison.

JEFFERSON, a co. in s.e. Iowa; 432 sq.m.; pop. '80, 17,478; drained by Skunk river and Big Cedar creek. It has a very productive soil, and contains rich coal measures; the land is well timbered. Co. seat, Fairfield.

JEFFERSON, a co. in n.e. Kansas, having the Kansas river on the s.; 550 sq.m.; pop. 12,526. It comprises rich prairie land, much of it wooded, and with coal and limestone deposits. It is intersected by the Kansas Pacific, and Atchison, Topeka and Santa Fé railroads. Co. seat, Oskaloosa.

JEFFERSON, a co. in n. Kentucky; bordered on the w. and n.w. by the Ohio river; 600 sq.m.; pop. '80, 145,902. The surface is varied and the soil fertile, producing wheat, Indian corn, hay, oats, and sweet potatoes. There are extensive manufactures. Co. seat, Louisville.

JEFFERSON, a parish in s.e. Louisiana, between lake Pontchartrain and Barataria bay, intersected by the Mississippi river; 384 sq.m.; pop. '80, 12,166—7,302 colored. It has a level surface, frequently marshy, and containing numbers of lakes; the soil is productive, the chief yield being in Indian corn, cotton, rice, sugar-cane, and sweet potatoes. It is traversed by the New Orleans, Jackson and Great Northern, New Orleans, Mobile and Texas, and Louisiana and Texas railroads. Co. seat, Carrollton.

JEFFERSON, a co. in s.w. Mississippi, separated from Louisiana on the w. by the Mississippi river; 630 sq.m.; pop. '70, 13,848—10,633 colored. The e. portion is heavily wooded with pine, the soil being generally fertile, and producing cotton, Indian corn, and sweet potatoes. Co. seat, Fayette.

JEFFERSON, a co. in e. Missouri, bounded on the e. by the Mississippi river, 504 sq.m.; pop. 15,380. The soil varies, being fertile in places and barren elsewhere. It abounds in metals; lead, copper, and cobalt being found in considerable quantities. The staple products are grain, cotton, tobacco, and wool. Co. seat, Hillsborough.

JEFFERSON, a co. in s.w. Montana; 2,720 sq.m.; pop. '80, 2,464—52 Chinese. It contains rich farming and pasture land, and gold is found near the Missouri and Jefferson rivers. Co. seat, Radersburg.

JEFFERSON, a co. in s.e. Nebraska; 576 sq.m.; pop. '80, 2,440. The surface varies between level land and high rolling prairies; the soil is very fertile. This county is intersected by the Little Blue river, and traversed by the St. Joseph and Denver city railroad. Co. seat, Fairbury.

JEFFERSON, a co. in n. New York, having lake Ontario on the w. and the St. Lawrence river on the n.w., and watered by the Black river and other streams; 1868 sq.m.; pop. '80, 66,106. It is traversed by the Rome, Watertown and Ogdensburg, and the Utica and Black River railroads, the latter by a branch. In this county is Alexandria bay, which comprises a portion of the lake of the Thousand Islands, and is a favorite place of summer resort. The surface of Jefierson co. is very varied in character, showing extensive marsh lands in the s.w., and ridges and undulations along the shore of the St. Lawrence in the n.e., while from the shore of lake Ontario it is gradually elevated to a height of 1000 ft. or more. The soil is fertile and easily cultivated; in some portions iron, lead, and copper occur in quantities. The principal productions are hay, wheat, Indian corn, potatoes, flax, hops, and barley; large quantities of wool, butter, and cheese also are produced. There are more than 150,000 horses, cattle, sheep, and swine in the county, and the manufactures are comprehensive and important. Co. seat, Watertown.

JEFFERSON, a co. in e. Ohio, divided from West Virginia by the Ohio river; 250 sq.m.; pop. 29,188. The soil is very fertile, and coal is found in large quantities; the productions are wool, grain, and cattle; and manufactures are extensive in carriages, wagons, clothing, etc. This county is crossed by the Pittsburg, Cincinnati and St. Louis railroad. Co. seat, Steubenville.

JEFFERSON, a co. in w. central Pennsylvania; 500 sq.m.; pop. 21,656. It is very rough and hilly, and is rich in coal and iron. The valleys are fertile, and the surface generally well wooded. The leading products are cattle, wool, and grain, and there are manufactures of leather. Co. seat, Brookville.

JEFFERSON, an e. co. in Tennessee; 225 sq.m.; pop. 19,476; bounded on the n.w. by the Holston river, and drained by the French Broad. The Virginia and East Tennessee railroad traverses this county. The surface is mountainous, and the scenery picturesque and imposing. The valleys are fertile, producing grain and tobacco. Co. seat, Dandridge.

JEFFERSON, a s.e. co. of Texas, intersected by the Texas and New Orleans railroad; 900 sq.m.; pop. '80, 3,489. The surface along the coast is level, and affords good pasture. It is watered by the Neches and Sabine rivers, and borders on the gulf of Mexico. The greater part of this county is heavily wooded. Cotton, rice, and tobacco are grown. Co. seat, Beaumont.

JEFFERSON, a n.w. co. in Washington territory; 1550 sq m.; pop. '70, 1268; bounded on the e. by Puget sound. It has a mountainous surface, and is heavily wooded with gigantic trees; Mt. Olympus, more than 8,000 ft. in height, is in this county. The soil is generally fertile, but is little cultivated, the chief industries being lumbering and the fisheries. Co. seat, Port Townsend.

JEFFERSON, an e. co. of West Virginia, bounded on the n.e. by the Potomac river, and s.e. and s.w. by Virginia; 280 sq.m.; pop. '70, 13,219. It is watered by the Shenandoah river, and contributes to form the valley of that name. The scenery of this county is very picturesque, especially that about Harper's Ferry. The soil is fertile, producing grain and affording good pasturage. Co. seat, Charlestown.

JEFFERSON, a s.e. co. in Wisconsin, drained by Rock river; 576 sq.m.; pop. 34,040. The soil is very fertile, and produces oats, hay, wheat, and tobacco. The Chicago and North-western and La Crosse and Milwaukee railroads traverse this county. Co. seat, Jefferson.

JEFFERSON, a t. and the co. seat of Marion co., Texas; pop. '70, 4,190; is situated 4 m. above Soda lake, on Big Cypress bayou of the Red river. It has become, since the war, a great shipping center, the Red river being navigable by large steamers; the principal exports are cotton, cattle, hides, beef, tallow, and wool; while the commerce with the interior is estimated to amount annually to more than \$10,000,000. Jefferson was settled in 1843.

JEFFERSON, a t. in Jefferson co., Wis., on the Crawfish and Rock rivers; pop. 2,176. The houses are generally built of cream-colored bricks, which are manufactured in the town. Jefferson is on the Wisconsin division of the Chicago and North-western railroad.

JEFFERSON, JOSEPH; b. Philadelphia, 1829; a character or eccentric comedian, whose reputation has been gained chiefly through his remarkable performance of the part of Rip van Winkle, in the play of that name, written by Dion Boucicault from Washington Irving's exquisite romance, which was, in turn, founded on a German legend. Mr. Jefferson inherited his talent—his grandfather, Joseph Jefferson, having been a celebrated English actor, who emigrated to America in 1795, and his mother, a Mrs. Burke, a vocalist of high reputation. He adopted the stage as a profession while very young, and was esteemed an original and able comedian, long before he essayed the part of Rip van Winkle, especially in the character of Newman Noggs, in an adaptation of Dickens's *Nicholas Nickleby*, and that of Asa Trenchard in *Our American Cousin*. Mr. Jefferson has gained some reputation as a painter of landscapes in oils, and has exhibited paintings of decided merit. He has amassed a considerable fortune in the practice of his profession, and is the owner of a sugar plantation in Louisiana and a valuable farm in New Jersey. His son, Joseph Jefferson, jr., also has displayed dramatic talent of a high order.

JEFFERSON, THOMAS, third president of the United States of America, was the son of a planter, and was b. at Shadwell, Albemarle co., Virginia, April 2, 1743. He studied at William and Mary's college, Williamsburg; and after leaving college was engaged for some years in the practice of law. In 1769 he was elected to the Virginia house of burgesses, where he joined zealously with the revolutionary party. In 1773, as a member of the assembly, he took a prominent part in the measures which resulted in the calling of the continental congress, to which he was sent as a delegate, where he drew up the celebrated declaration of independence. During the war in defense of this declaration he was governor of Virginia, and in 1784 was sent minister to France, where his manners, accomplishments, and more solid qualities did much to secure to America the powerful alliance that insured her success. Returning in 1789, he was appointed by Washington, secretary of state, a post due to his abilities, his influence, and his distinguished services. The federal constitution had been adopted, and the two parties which soon divided the country began to develop themselves. Washington, John Adams, Jay, and Hamilton, were in favor of a strong centralized government; Jefferson led the party in favor of states' right and a federal government of restricted and carefully-defined powers. The first party took the name of federalists; the latter were first called anti-federalists, then republicans, and finally adopted the title first given them as a reproach, of democrats. When Washington retired, after eight years of office as president, and a new election took place, the two highest candidates, as leaders of the opposing parties, were John Adams and Jefferson. Adams, having the largest vote, was declared president, while Jefferson having the next highest number, became the vice-president, 1797. The strife of these parties culminated in 1809, when Jefferson and Aaron Burr were elected president and vice-president, against John Adams, the federal candidate. On entering upon the presidency, he reduced the government to a republican simplicity, made few removals, and resolutely refused to appoint any of his own relatives to office, saying that he "could find better men for every place than his own connections." The most important act of his administration was the purchase of Louisiana from France. At the end of eight years he retired to his residence at Monticello; but he did not retire to a repose of idleness; he kept up an immense correspondence, dispensed the hospitalities of his mansion to visitors from every part of the world, and founded the university of Virginia, of which he was for many years the rector. Though born and educated in the first rank of colonial life, he was a democrat in theory and practice; he held that "the world is governed too much," and that "that government is best which governs least." Though a large slave-holder, he labored for the prohibition of the slave-trade and of slavery in the territory beyond the Ohio river, and advocated emancipation in Virginia. His writings consist mostly of state papers and letters. His only literary work was his *Notes on Virginia*, published in 1782. He had one child, a daughter, and has numerous descendants. His death was very remarkable; it occurred on July 4, 1826, while the nation was celebrating the fiftieth anniversary of the declaration of independence, which he had written. On the same day, and almost at the same hour, John Adams, the second president, who had signed with him the declaration, died in New England.

JEFFERSON, THOMAS (ante), 1743–1826; b. Va.; author of the American Declaration of Independence, and president of the United States from March 4, 1801, to March 4, 1809. He was the eldest among the eight children of Peter Jefferson, a Virginia planter, who held a leading place in his region, and Jane Randolph; both father and mother being natives of Virginia. Thomas was educated first in a common school in the ordinary studies for a boy of seven years of age, and when nine years old the rev. Mr. Douglass gave him instruction in French and in classical languages. He prepared for college under the tuition of the rev. Mr. Maury, and at the age of 17 became a student in the college of William and Mary. On his way to the college he met and made the acquaintance of

Patrick Henry, who was at that time a broken-down merchant, and had given no sign of the wonderful oratory for which he became famous at the beginning of the revolution. Jefferson was a hard-working student and speedily gained favor with his teachers; twelve to fifteen hours per day he devoted to his books, and became fairly versed in the classical tongues, and in French, Italian, and Spanish, to which he added a tolerable education in mathematics. On leaving college he turned his attention to the law, studied for about five years under judge George Wythe, and in 1767, at the age of 24, was admitted to the bar. As a lawyer his success was immediate, and he soon had a wide practice, his income from clients in the first year being about \$3,000 at a time when legal charges were comparatively light. In the following years he was still more successful; and in 1771 a prominent lawyer put him in charge of all his unfinished litigation. In 1769 Jefferson was chosen a member of the Virginia house of burgesses, and immediately became conspicuous for his opposition to the encroachments of the British government. He is credited with writing the resolutions that contained the points of a reply to governor Botetourt's speech. He was also one of the signers of the non-importation compact. The question of emancipating slaves was then agitated in England, but little had been heard on the subject in the colonies. Jefferson proposed an act which would give masters the right to free their slaves whenever they thought proper; but the bill failed to pass, and the principle was not established until 17 years later. His term over, he resumed law practice, removed to an unfinished house (subsequently world-famous as "Monticello"), and on New Year's day, 1772, was married to Martha Skelton, daughter of John Wales, a lawyer, and widow of Bathurst Skelton—a remarkably handsome and graceful woman of 23 years, who brought with her a considerable property. Among her property was \$4,000 acres of land and 135 slaves. Added to about an equal amount belonging to the husband, they were enabled to begin wedded life on a liberal scale.

Early in 1773, Jefferson, Henry, and others, devised the famous committee of correspondence for the spreading of political intelligence among the colonies, and the burgesses made the two men members of that committee. In the summer the governor dissolved the house, but an election was soon afterwards held at which all the members were re-chosen and appeared in their seats in the spring of 1774. Again the house was dissolved by the governor; but not until after passing a resolution offered by Jefferson to observe the 1st of June in fasting, humiliation, and prayer, because of the adoption in parliament of the Boston port bill. After the dissolution the burgesses met secretly and proposed a convention of deputies, to be chosen by the people and to meet Aug. 1. Of this convention Jefferson was made a member, but illness prevented his attendance. This body was to choose delegates to the general congress of the colonies, and Jefferson wrote elaborate instructions for the guidance of the congressional delegates. These he sent to Peyton Randolph, the presiding officer of the convention. Some time afterwards, the burgesses directed the printing of these instructions, and the first of Jefferson's political writings appeared as "A Summary View of the Rights of British America." This document was revised by Edmund Burke and published in England, a circumstance which Jefferson supposed was the reason for including his name with others as a traitor in a bill to punish sedition. This "Summary" was a forcible argument for the right to resist oppressive taxation, and many of its points bear a close resemblance to certain parts of the Declaration of July 4, 1776. It was so radical that the convention refused to adopt it, most of the members still hoping for some peaceable compromise with the mother country. Jefferson was a member of the second Virginia convention, which met in the spring of 1775, and was one of the committee that reported a plan of defense. In the choice for members of congress Jefferson was selected as the substitute for Peyton Randolph, whose duties as governor of the colony might prevent his attendance. At the meeting of the burgesses June 1, Jefferson, though not a member, prepared the answer of the Virginia assembly to the conciliatory propositions of the home government. On June 13 Washington appointed Jefferson commander-in-chief of the forces of the colonies, and this act placed the colonies in open resistance to the British government. In congress Jefferson's arrival was impatiently awaited; and when he came his bold and vigorous reply to lord North's "conciliatory proposals" was cordially approved. This document and the "Summary" gave him high position among the ablest men in congress; and though never making long speeches he was in committee so "prompt, frank, explicit, and decisive," says John Adams, that he quickly won the warmest respect of his fellow-members. He was one of a committee to prepare a declaration of the reasons for an appeal to arms, and he and John Dickinson wrote the document which congress adopted. Jefferson was then requested to prepare the reply of congress to the proposals of lord North, and congress approved the reply and adjourned. In Nov., 1775, it was known that the last petition to the home government had been rejected. In May, 1776, Virginia instructed her delegates in congress to urge a declaration of independence by the colonies. Events were hastening to a crisis; in the early part of June a committee to prepare such a declaration was chosen, and Jefferson was put at the head. By general consent the other members of the committee looked to him to prepare the document. He consented, and wrote the American Magna Charta, all of which was his work, except two or three verbal changes proposed by Adams or Franklin. The declaration was presented to congress June 28. Four days afterwards a resolution offered by Richard Henry Lee, in obedience to instructions by Virginia, to

the same effect as the coming declaration, was adopted. On July 2, Jefferson's report was taken up, and a very warm debate followed, occupying congress exclusively until the adoption of the famous document. Some of the most eminent members made vigorous opposition. On the other side were equally eminent members as vigorously urging adoption. On Thursday, July 4, the declaration was adopted, and the record received a document that has no rival in importance in modern political history.

At the next election, Jefferson was again chosen a delegate to congress, but he declined to take his seat, believing he could best serve the cause of liberty at home, where he proposed important changes in the local laws, with a view of preparing the way for the self-government which would follow the coming independence of the colonies. During the spring he had prepared a sketch of a constitution, which he now sent to the convention in session. In the meantime a constitution had been drafted by George Mason, and the convention was about to vote upon it. The result was the addition of Jefferson's preamble to Mason's constitution, which was adopted. Jefferson was chosen to the legislature, where he labored incessantly in reforming old and proposing new laws; but he met with great opposition in the case of many of his most important propositions, and this mainly from the aristocratic and the wealthy, who feared abridgment of their privileges. One of the most important of his reforms was in the bill to establish religious freedom; another to abolish entail, and another to put an end to the right of primogeniture. At that time the condition of society in Virginia was such that the "old families" would naturally be shocked at the bold iconoclasm of Jefferson; but their opposition was in vain; the old English customs and laws were doomed, as incompatible with a republican form of government. With just pride for his share in these reforms Jefferson wrote, in the inscription prepared by himself for his monument, not only "Author of the Declaration of Independence," but also—"and of the statute of Virginia for Religious Freedom." He remained in the legislature in 1777-78, and among his leading measures was a bill to prohibit the importation of slaves. On June 1, 1779, he was chosen governor of the colony, or state, taking the chair in the darkest period of the revolution. The English were about to push the war in the south; Virginia had 10,000 men in the field, but at home was almost defenseless. The British invaded Georgia and turned northward; almost the last of Virginia's men, horses, and arms were sent to the relief of the imperiled territory. There were no coast or river fortifications, and no means of opposing a hostile fleet beyond a few small vessels and gunboats poorly equipped and feebly manned. The enemy seized Hampton and Portsmouth, and the traitor Arnold, with 2,000 men, moved up the James without serious opposition, entering Richmond, the capital, Jan. 5, 1781. The governor and other officers were compelled to leave. Arnold plundered the town, burned a portion of it, and sailed away. In April Cornwallis sent Tarleton to capture or disperse the Virginia legislature, then assembled at Charlottesville. He surprised, but did not capture them. Jefferson, who was at Monticello, near Charlottesville, hurried away his family, gathered his more valuable papers, and followed them. Tarleton had been sent especially to seize governor Jefferson, but his men stopped so often to plunder that he failed. Jefferson's term of office expired a day or two before Tarleton's foray. For his conduct at this time Jefferson was widely censured, and he felt the adverse criticisms keenly, to which mental suffering was added the loss of his wife within this period of trouble. He retired to his home, but was soon called upon by congress to become one of the commissioners to make the treaty of peace with England; but matters had progressed so far before he could sail that the appointment was revoked. He had been chosen a member of congress, and was chairman of the committee to whom the peace treaty had been referred. At the following session of congress he became active and prominent in legislation, proposing the system of coinage for the government, and preparing a plan for the temporary government of the western territory. His plan was adopted with only one important amendment; he had provided for the total abolition of slavery after the year 1800; but to this congress would not agree.

In May, 1784, Jefferson, John Adams, and Franklin were sent to Europe under a general power to make commercial treaties. Jefferson took his eldest daughter with him, and joined his associate commissioners in Paris in July. Important treaties were made with Prussia for trade, and with Morocco for the prevention of piracy. By these and other agreements blockades were abandoned, contraband articles were no longer to be confiscated, and the axiom that "the flag covers the cargo" was established. Efforts were made with England, but she would not listen to treaty propositions. About this time Jefferson published the first of his "Notes on Virginia." In 1785 he succeeded Franklin as minister to France, and in the course of his duties procured many commercial advantages for the new republic. He traveled in Italy and Germany, and in Paris became intimate with D'Alembert, Condorcet, and other extreme liberals, with whom he seemed to have an affinity. The effect of these associations was to make him through life a warm friend of the French people. In 1789 he returned, and under Washington became the first secretary of state. The organization of the government had defined political parties, and hardly was Jefferson in office before he was recognized as the republican (afterwards democratic) leader, while Alexander Hamilton was at the head of the federalists. Hamilton favored a strong federal government; Jefferson stoutly insisted upon state sovereignty and the greatest practicable limitation of the federal power.

Hamilton, however, was successful in most of his propositions. His system of finance was approved, although violently opposed by Jefferson and Randolph. Early in 1792 Jefferson made an exhaustive report on the relations between Spain and the United States, concerning boundaries, treatment of citizens, Indian invasions, the return of fugitives, and various commercial matters. In the war between France and England, 1793, the question of neutrality rose into great importance. Jefferson and his followers were warmly in favor of France, and were ready to send fleets of privateers against English commerce. The federalists (with no love for England, although so charged) insisted that the United States should keep out of the trouble; that no cause of complaint should be given to either of the belligerents; that America should keep peace and friendship with all governments, but should beware of entangling alliances with any nation. Washington issued a neutrality proclamation, under Jefferson's advice; and at the same time the latter advised that Genest, who was here as minister from France, should be officially received. The conduct of Genest in fitting out privateers in American ports raised great excitement, which was not quieted until long after his government had recalled him. Jefferson was in favor of the mildest treatment of the offender, while Hamilton and others were for extreme and summary measures. This episode created a bitterness between Jefferson and Hamilton that was never removed.

On the last day of 1793 Jefferson resigned his secretaryship and went to his home at Monticello to attend to his private business. Washington's announcement in Sept., 1796, that he would not be a candidate for a third term set politicians at work, and the result was that John Adams, then vice-president, and Thomas Jefferson, were nominated by their respective parties for the office of president. Adams, having the highest vote, was chosen president, and Jefferson having the next highest, was, under the law of the time, chosen vice-president. Like most vice-presidents down to the present day, while in office he was practically out of political life, and he passed the greater part of his time at his country home. He was, however, a close observer, and could not fail to have a deep interest in the great reaction of feeling in regard to France that followed the reign of terror. The president's war-message in the early part of 1797 created intense excitement; congress declared all treaties with France void; ship-masters were instructed to resist search; large appropriations were made for defense; the alien and sedition act was passed, with other kindred acts; and in spite of the republican opposition, that party was driven as a last resort to contest the constitutionality of the alien and sedition laws, and to work up their state organizations, in which capacity they produced the Virginia resolutions of 1798 and greatly furthered the cause of state sovereignty. The excitement regarding France was soon over, and a minister was sent to that country in 1799. Washington's death, in Dec. of that year, for a brief period hushed partisan strife; but only a few months passed when the debate became more fierce than ever. The republicans gained ground rapidly, and at the presidential election in 1800 the electoral vote (except a few which might be called "scattering") was exactly divided between Jefferson and Aaron Burr, both republicans. The house of representatives, after a long struggle and 36 ballots, made Jefferson president, and Burr, according to the law, took the second place. Jefferson placated the federalists, made few removals of public officers, and avoided all action that would be likely to impair his popularity. The stately formalities of the previous administrations were ignored; Jefferson sent his messages to congress by the first boy or man at hand, and he refused to receive the customary address from that body. Radical changes were going on in the dress and manners of the people. Trousers took the place of knee-breeches, and the old courtliness gave way to a freedom of manners that could not fail to shock the members of the old aristocracy.

The first term of Jefferson's administration was quiet, although some important events occurred, the chief of which was the purchase of Louisiana from France at the price, comparatively low, of \$15,000,000. Explorations across the continent were made at the president's request. A little war with Tripoli and the stopping of Algerine piracy were other events. In 1804 Jefferson was re-elected, with George Clinton for vice-president, there being no real opposition, since the federal party had previously gone to pieces. Their great leader Hamilton was killed in a duel with Burr in July of this year. In his second term Jefferson had to deal with the wild operations of Burr in the attempted raid upon Mexico, involving war with Spain, and other serious consequences. The prominent office and the still more prominent position held by Burr made his rash movements and his arrest and trial matters of the greatest importance. Such a trial could not fail to assume a political aspect, and the opponents of the government violently denounced it as partisan persecution. No doubt Jefferson was satisfied with Burr's acquittal; he had done his duty to all our foreign relations in the arrest and trial, and they would have no just cause of complaint. Another event during Jefferson's second term gave him much uneasiness. This was the British orders in council, followed by the Milan decree issued by Bonaparte. The effect of these, though not directed at the United States, was to ruin the foreign trade of the country and spread financial disaster over the land. But these orders and decrees were of far less political importance than the "right of search" claimed and exercised by Great Britain, under which vessels of the United States on the high seas were boarded and searched for English subjects. England then held the doctrine "once a subject always a subject."

The impressment of American sailors went on in spite of protest, until a crisis was precipitated in June, 1807, by the English ship *Richard* firing into the American frigate *Chesapeake*, and boarding and carrying away four of her men on the charge of being British deserters. The country flamed up in excitement; the president proclaimed against the coming of English armed ships into the ports or water-jurisdiction of the United States, and preparations looking to probable war were made, the first act being the embargo, which was declared in consequence not only of the hostile attitude of England but of France also. As the embargo prohibited all American vessels from leaving home ports it amounted to an entire suspension of foreign trade. The federalists started anew into life, and made the most vigorous opposition to the embargo, which was repealed Feb., 1809, only a few days before Jefferson finally left the executive chair. With March 4, 1809, his political life came to a close. He retired to Monticello, and took no further part in national questions. His plantation had most of his care, but he found time to give valuable assistance in establishing a college near Charlottesville, out of which grew the university of Virginia. He was rector of the college in 1819, and during his life took great pride in the institution, so much so that he wrote, as a part of his epitaph, "Father of the University of Virginia." Early in 1826, having fallen into serious financial embarrassment, owing chiefly to his prodigal hospitality, Jefferson was authorized by a legislative act to dispose of his plantation by lottery, but the plan was never carried into effect. In June his health failed rapidly, and on the evening of July 3 it was clear that he was fast passing away. But he lived until the afternoon of the next day, dying a few hours earlier than his presidential predecessor, John Adams, who was then lying at the point of death at the family mansion in Quincy, Mass. In person Jefferson was tall (6 ft. 2½ in.), with a bony but well-developed frame, angular features, ruddy complexion, sandy or reddish hair, and light hazel eyes. It need hardly be said that he was a man of positive opinions and convictions, and quick and firm in decision. His notions of democratic equality touched the extreme; he would not even tolerate the innocent prefix of "Mr." because it was a title. His views on religion were so liberal that he was freely accused of infidelity. He had profound respect for the moral character of Christ, but no belief in the divine redemption through Christ's work. In society he was a leveler, if not an iconoclast. He desired to reduce the aristocracy, whether of blood or wealth, and to elevate the mass of the people. Such ideas would naturally oppose human slavery, which he considered to be a great political and moral evil, saying, in reference to it, "I tremble for my country when I remember that God is just." Although he never made a formal speech in his life, he was the ablest political leader of his time. He was quick to perceive and prompt to act. Much of his vast political work was done with the pen, and no statesman of the time had any such amount of correspondence as was sent out and received at Monticello. His home might be likened to a modern telegraphic center, where the wires come together from the farthest corners of the country. He had fair scientific acquirements, and took much interest in natural history. He was a good husband, an affectionate father, and a forbearing master. Where his friendship was given it was warm and sincere; while as a host to strangers he was regarded as exceptionally charming. His writings are widely known. The more important are *Notes on Virginia*; *Manual of Parliamentary Practice*; and *The Writings of Thomas Jefferson*, being his autobiography, correspondence, reports, messages, addresses, and other writings, official and private. The originals of the last named work were purchased by congress and issued in 9 vols. by the government.

JEFFERSON CITY, capital of Missouri. United States, on the s. bank of the Missouri river, 125 m. from St. Louis, with which it is connected both by the river and the Pacific railway. It has a brisk trade with the hunters, and overland emigrants to California and Utah. The city has a state-house, governor's residence, state penitentiary etc. Pop. '70, 4,420.

JEFFERSON CITY (*ante*), the capital of Missouri and co. seat of Cole co.; pop. '74, 7,500; is situated on the right bank of the Missouri river, 143 m. from its junction with the Mississippi. It is on the line of the Missouri Pacific railroad, by which it is connected with St. Louis. The site is commanding and affords a fine view of the attractive scenery on the opposite bank of the river. The city is built on an elevation, and contains a number of handsome edifices, including the governor's residence, the state penitentiary, state-house, and 8 churches.

JEFFERSONIA, a perennial herb, with matted fibrous roots and glabrous leaves; named in honor of Thomas Jefferson; sometimes called twin-leaf; sepals 4, soon falling off; petals 8, oblong, flat; stamens 8, oblong-linear, on slender filaments; ovary ovoid, soon becoming gibbous (larger on one side than on the other); stigma, two-lobed; pod, pear-shaped, opening half-way round horizontally, the upper part making a lid; seeds in many rows on the lateral placenta. It belongs to the order berberidaceæ, sometimes called the barberry family.

JEFFERSONVILLE, a city of Clarke co., Ind.; pop. 7,254. It is situated on the Ohio river, 5 or 6 m. from New Albany and 108 m. from Indianapolis, and is connected with Louisville, Ky., which is directly opposite, by an iron railroad bridge, the longest of its kind in the United States, and which unites the railroad system of the north to that of the south. The city is built on high ground, and commands a fine view of

Louisville and of the surrounding scenery. Railroads terminating here are a branch of the Ohio and Mississippi, and the Jeffersonville, Madison and Indianapolis railroad, the latter crossing the river on the iron bridge. There are a number of important manufactorys in the city of railroad cars, steamboats, farm implements, etc. An arsenal, state-prison, and 14 churches are among the public buildings.

JEFFREY, FRANCIS, Lord, a celebrated Scottish critic and lawyer, was born in Edinburgh, Oct. 23, 1773; studied classics, logic, and belles-lettres at Glasgow and Oxford, and law at the university of his native city. In 1794 he was called to the bar. Two years before this he had become a member of the Speculative society (in connection with the university). Jeffrey soon became prominent among the members by the keenness and liveliness of his intellect, and the elegance of his literary taste, but his progress at the bar was slow, partly on account of the antipathy which then existed to literary lawyers, and partly on account of his political opinions. Meanwhile he and several other young men then residing in Edinburgh, ambitious of finding a wider outlet for their talent than the discussions in the Speculative society or the practice of the bar afforded, conceived the idea of starting a critical journal. The first proposer of the scheme was the rev. Sydney Smith. The result was the establishment of the *Edinburgh Review* (q.v.), of which Jeffrey became editor, an office he retained till 1829. His own contributions were generally the most brilliant and attractive that appeared in its columns. On ethics, polities, and many of the questions affecting the social well-being of man, he has written with much clearness, penetration, and force; but the thing on which he is said to have placed the highest value was his *Treatise on Beauty* (see *AESTHETICS*), a charming melange of criticism, description, and sentiment, but of doubtful philosophic worth. After some years Jeffrey's practice at the bar began to increase; in jury trials he shone to great advantage, and particularly in the trials for sedition between 1817 and 1822. In 1830 he became lord-advocate for Scotland; and after the passing of the reform bill he was returned to parliament for the city of Edinburgh, which he continued to represent till 1834, when he gladly exchanged the turmoil of party politics for the duties of a judge of the court of session. During the latter years of his life, Jeffrey resided at Craigerook castle, in the vicinity of Edinburgh, where he died, Jan. 26, 1850. A selection of his essays, in 4 vols., appeared in 1844. A biography of Jeffrey by his friend, Henry lord Cockburn (q.v.), a brother-judge of the court of session, was published in 2 vols. (Edin. 1852).

JEFFREYS, GEORGE, Lord, 1648–1689; an English lawyer, who rose to high position on the bench, but disgraced the ermine and rendered his name infamous forever by his needless cruelties and the unparalleled brutality of his manners. He was the son of a squire of small means, who, however, contrived to give him an education, which only rendered his evil propensities stronger. Macaulay said of his intellect, that “across labyrinths of sophistry, or through masses of immaterial fact, it would go straight to the true point.” Such manners as he possessed were marked by a brutal ferocity which was never equaled by the worst ruffians or infamous characters among those whom he condemned. The very name of lord Jeffreys, even after the lapse of centuries, is synonymous with cruelty. He commenced practice at the Old Bailey, and was first common sergeant and then recorder of London, and, being a willing slave of the court, rose in his profession, until, in 1683, he became chief-justice of the king's bench. It was in this capacity that he traversed the western circuit, when the severity of the sentences which he passed upon all who had taken part in Monmouth's fatal rebellion gained for it the name of the “Bloody Assizes;” he is said to have condemned 700 of these offenders to the scaffold, and boasted of his action. He was made lord high chancellor by James II., but on the outbreak of the revolution and the downfall of his patron, James II., fearing the treatment which he had reason to expect from William III., he attempted to leave the country in the dress of a common sailor; but was recognized in spite of his disguise and taken to the Tower, where he died. He was created a peer by James II., with the title of baron Jeffreys of Wem, but, although he had 12 children, the family became extinct in a comparatively short time, and the title lapsed.

JEFFRIES, JOHN, 1744–1819; graduated at Harvard, and afterwards traveled in Europe, and attended classes at the medical colleges in London. He visited Scotland, and received the degree of M.D. from Aberdeen university. Returning to America, he practiced at Boston until that city was evacuated by the British, when he accompanied the English troops to Halifax. He distinguished himself as an army surgeon, and in 1779 was appointed surgeon-major of the British forces in America, and was for a short time in Savannah, Ga. Although he was offered a similar position with the troops in India, he declined; he was greatly interested in scientific experiments, and more especially in the construction of balloons, with a view to atmospheric experiments, and accompanied François Blanchard, in his balloon trip from Dover across the channel, on which occasion the aeronauts landed in the midst of the forest of Guines in France. Dr. Jeffries received many testimonials for this exploit from the various scientific societies of Europe and America. Returning to his native town, Boston, he continued the practice of his profession in that city. He proposed giving a series of anatomical lectures there, but the popular feeling against it was so strong that a mob broke into his room, seized the

subject which was to illustrate his lecture, and by their violence put a stop to the course of lectures.

JEHOSHAPHAT, fourth king of Judah, B.C. 915-890, son of Asa, connected by the marriage of their children with Ahab, king of Israel, and was his ally at the battle of Ramoth-Gilead, suffering defeat from the Syrians. He was an ally of Ahaziah, king of Israel, but was unfortunate in a naval venture which he sent on an expedition to Ophir, the fleet never reaching harbor. In alliance with Jehoram of Israel, and the king of Edom, he made a successful campaign against Moab. In the closing years of his reign Jehoram, his son, shared the throne with him. He is celebrated for his successful opposition to the worship of idols, for the respect which he inspired in the minds of contemporaneous rulers, and for the prosperity of a government in which agriculture and commerce were encouraged. Jehoshaphat signifies "Jehovah's judgment."

JEHOSHAPHAT, VALLEY OF, a valley in which the prophet Joel predicts that God would, after the return of Judah and Israel from captivity, gather all the heathen, and there judge them for their evil treatment of Israel. The prophet may have had in mind the great victory of Jehoshaphat in the wilderness of Tekoa over the hordes of his enemies. Or it may mean a valley in which some great victory would be won, which should utterly discomfit the ancient enemies of Israel, resembling the victory obtained by Jehoshaphat over the Ammonites, Moabites, and Edomites, 2 Chron. xx. 22-26. Where this valley was we do not know, but in modern times the name is applied to the deep ravine which separates Jerusalem from the mount of Olives, and which was formerly the bed of the brook Kedron. When the name was first given to this spot is not known. Neither in the Bible nor Josephus is there any trace of it. The only name in both for this gorge is Kedron or Cedron. We find the new name first given in the 4th c. by Eusebius and Jerome. Since then the name has been adopted by travelers of all ages and all faiths. Jews, Moslems, and some Christians believe that here is to be the scene of the last judgment. The steep sides of the ravine are crowded with the sepulchers of the Moslems and the Jews, all awaiting the assembly of the last judgment. This valley is fully described by Robinson in his *Biblical Researches*.

JEHOVAH (Heb. *Yehovah*; more correctly, *Yahwe*, *Yahāreh*, or *Yahārah*; in poetry, *Yih*; generally believed to be derived from the verb *haya*, "to be," though scholars are far from unanimous in regard to its etymology) is one of the names employed in the Old Testament. Its meaning—if the root be *haya*—is, "He that is," "the Being;" or, since the word contains all the forms of the past, present, and future tenses, "the eternal One." It is generally employed to express a different conception of the Deity from that which is contained in the word *Elohim* (q.v.). The latter appears to be the older term, in use before the Hebrews had attained a national existence, while *Jehovah* exclusively seems to denote the national God, supreme over all other deities, and who, under this name, had, according to Exodus vi. 3, not "made himself known" to the patriarchs before the time of Moses. That Jehovah is specifically the God of the Hebrews is clear from the fact, that the heathen deities never receive this name; they are always spoken of as *Elohim*. Moreover, the altars, the sacrifices, the festivals, the tabernacle, the temple, the priesthood, and the prophets, all belong emphatically to Jehovah. Gideon shouts, "The sword of Jehovah and of Gideon," as a Roman warrior would have invoked the aid of Jupiter. In one sense, the term Jehovah is less broad and universal in its application than *Elohim*, who, in the first verse of the Bible, appears as the creator of heaven and earth, and who is God over all, irrespective of nations; but in another sense, it clearly indicates an advance in religious conception. While *Elohim* is introduced more as an Almighty Creative Power than a "Being," Jehovah is God in full personal relation to man—he speaks to his creatures, makes covenants with them, becomes their law-giver, and desires their homage and worship. The Hebrew writers even run their representations of the Divine personality into what seem to us the extremest forms of anthropomorphism.—Deep reverence for the Deity and the divine name has led the Jewish church to the substitution of *Adonai* (*Lord*) in the pronunciation of Jehovah, the latter being vowelled by the Masoreths like the former.

A very nice and difficult controversy with respect to the authorship and unity of the Pentateuch, has long been carried on among scholars in connection with these two names. See **GENESIS** and **PENTATEUCH**.

JEHOVAH (*ante*), the name given in the Old Testament to God as revealing himself to man from the beginning of history, and to become incarnate in the fullness of time. After the narrative in the first of Genesis, ascribing the creation of the heavens and earth to God, there is a repeated account of a part of the work, in its particular relations to men, which is ascribed to Jehovah God, who is said to have appeared to Adam, Eve, Abel, and Cain. Afterwards, generally named Jehovah, sometimes God and Jehovah God, he appeared to Noah, exercising sovereign control over men in sending the deluge, in delivering from it, and promising that there should be no repetition of it; and, when the number of mankind had again increased, in confounding their speech so that they were scattered abroad. At and after the calling of Abraham a more particular account of the divine manifestations is given, in which the name most frequently employed is Jehovah; and with it are interchangeably used Lord Jehovah, Jehovah God, Almighty God, and God. Frequently the divine appearance was in human form, receiving the names

Jehovah, Angel Jehovah, and God; and administering providential government in blessing Abraham, delivering Lot, and destroying the cities of the plain. These divine manifestations were repeated to Isaac and Jacob, the latter of whom, at the close of his life, thus summed up the account of them: "God before whom my fathers Abraham and Isaac did walk, the God who fed me all my life long, the Angel who redeemed me from all evil." In the deliverance of Israel out of Egypt a great advance was made in the manifestation of Jehovah. The Angel Jehovah, called also Jehovah and God, appeared to Moses at Horcb, sent him to Pharaoh, performed the mighty works which resulted in the release of Israel, divided the Red sea, gave the law at Sinai, administered in the wilderness the divine government of mercy and judgment down to the death and burial of Moses; brought the people into Canaan under Joshua; and governed them during the times of the judges, kings, and prophets.

The name Jehovah, used thus in the Old Testament, was translated in the Greek version by *o κυριος* (Lord), which by that fact became familiar to the Jews and was adopted in the New Testament as a title of the divine Redeemer incarnate among men. In this way it came about that in the English version of the Bible the Hebrew name Jehovah was translated the Lord. Concerning the signification of the Hebrew name, derived as it evidently is from the verb denoting being or existence, two opinions are held: first, that it represents the eternal existence of God; and second, that in the Old Testament it pointed forward to his existence as it would be manifested in his coming to be the Redeemer. All admit that its form in the Hebrew Bible—Jehovah—is a modification of the original, resulting from the practice of the later Jews in pronouncing *Adonai* instead of it, whenever they came to it in the text, and in transferring to it the vowels of the substituted word in order to mark the change. Its proper form is the future of the verb from which it is derived; and its meaning seems to be pointed out by God's own answer to the question of Moses concerning the name by which God should be spoken of to Israel: "Say, 'I WILL BE' hath sent me unto you; and say, moreover, Jehovah, God of your fathers, hath sent me unto you; this is my name forever, and this my memorial unto all generations." This being the meaning of the name, some go further and say that, probably, it was first used by Eve at the birth of her first-born son when she named him Cain, meaning acquisition, and said "I have acquired a man, even him who will be," that is the coming One, the promised deliverer. Such being the origin of the word it was adopted, as those who hold this theory think, by the Lord as a name by which he would be known among men as the Redeemer through all generations. An argument against this view is that the particle prefixed to Jehovah in this text, translated in the English version "from," often has the force of a preposition, and from the beginning of Genesis to the cessation of the deluge is certainly so used ten times. It is therefore possible that Eve may have meant, I have acquired a man *with* the Lord, that is by his help. The argument for the view is that the prefixed particle often has only a demonstrative force, giving emphasis to the word before which it is placed; and that in the part of Genesis just specified it is so used without question 108 times (49 prior to the particular instance referred to and 59 after it) to give emphasis to each thing brought forward in succession as created or divinely ordered. The probability, therefore, so far as the use of the word is concerned, is, it is said, more than ten to one in favor of the view. That Eve supposed her first-born son was the promised deliverer seems to be indicated by her disappointment when, a second having been born, she named him *vanity*. And if she supposed so, why should it not be thought that the particle prefixed to the "coming One" was intended by her to point him out emphatically, as in the more than one hundred instances which it so much resembles?

If the meaning of Jehovah be the coming One, the deliverer, it explains the declaration of God to Moses that he had been known to Abraham, Isaac, and Jacob as God Almighty, but not by his name Jehovah. That they were acquainted with the name as ascribed to God is manifest; but it is also certain that while the Lord had exhibited his great power in providing for and protecting them he had not by any signal interposition made himself known as the deliverer. This he was now about to do, in stretching out for the deliverance of Israel a mighty hand, such as the world had never seen, but which has been held in remembrance ever since. As the fullness of time drew nearer, the prophets gave increased prominence to Jehovah as the coming One: from the comforting words of Isaiah, "Prepare ye the way of Jehovah, behold Jehovah God will come with strong hand;" to the closing words of Malachi, "The Lord whom ye seek shall suddenly come to his temple, even the Angel of the covenant whom ye delight in." When the time had arrived, John the Baptist announced the Lord as the coming One after him; and from the prison sent the inquiry to him, Art thou the coming One? And as, at the beginning, Jehovah himself had promised his coming, so, at the end, he opens the apocalypse with the declaration, "I am he who is, who was, and who is to come, the Almighty;" and closes it with the promise, "Surely I come quickly."

JEHU, eleventh king of Israel, B.C. 883-855; son of Jehoshaphat, and grandson of Nimshi, beginning his military career as one of the guards of Ahab. He was distinguished as a charioteer for his rapid driving, and a certain reckless vehemence of manner. The first mention made of him in history is his appearance, with his comrade, Bidkar, on a journey from Samaria to Jezreel, riding in company with Ahab, when he

hears the warning of Elijah against the murderer of Naboth. He is mentioned in the vision at Horeb as the coming king of Israel, who should be an instrument of vengeance upon Israel, but was anointed by a prophet of Elisha in the reign of Ahaziah and Jehoram, when as a commander in the Israelitish army, posted at Ramoth Gilead, at a council of war, there appeared unexpectedly at the door of the tent a disciple of Elisha, who poured the contents of a vial of sacred oil upon his head, announced the prophecy of Elisha that he was to become king of Israel, and that the house of Ahab should fall by his hand, then vanished from their midst. On this suggestion he was proclaimed king with the wildest enthusiasm. He at once appointed Bidkar captain in his place, and having by a strategic movement brought himself face to face with Jehoram on the field of Naboth, killed him by a shot from his bow. At that moment he recalls to Bidkar's remembrance the scene of the ride with Ahab, and the warning of Elijah. Riding into the conquered city he caused Jezabel to be thrown from the palace walls, killing her instantly. He required, as proof of the loyalty of Samaria, that the heads of all the royal princes should be brought to him; the next morning 70 human heads lay in a pile at the palace gate. He also slew 42 brothers of Ahaziah, sons of the late king of Judah, whom he met on his way to Samaria. Having made an ally of Jehonadab the Rechabite, he proclaimed a festival, at which he assembled all the ministers and chief adherents of Baal, whom he provided with sacerdotal vestments so that the worshipers of Jehovah might not be confounded with them. The multitude of these idolaters filled the great temple of Samaria, around which, to prevent the escape of any, guards were placed. The chief sacrifice Jehu himself offered in the fervor of his pretended zeal. After he had made himself doubly sure that none except the adherents of Baal were present, he gave the signal to his trusted guards, who, by a sweeping massacre, cut off the chief heathen population of the kingdom. Thus a staggering blow was struck at a form of idolatry which, from its entrance among the Israelites, had been the source of unbounded licentiousness, varied abominable immoralities, and cruel infanticide. But after this Jehu's hostility to idolatry manifestly declined, and for fear of adverse political consequences to himself, he allowed the worship of the golden calves to continue undisturbed. For the measure of right that he had practiced his dynasty was continued through four generations, but because of his imperfect obedience his prosperity was cut short. He died in outward tranquillity and was buried in Samaria. His name has passed into a type of fierce and fiery zeal uncontrolled by the grander forces of righteousness and the Divine love.

JEISK, or EISK, a. t. of Russia, in the country of the Kuban Cossacks, or Black sea Cossacks, on the eastern shore of the sea of Azov, 60 m. s.w. from Azov. It stands on the shore of a small land-locked bay, into which flows the river Jeisk. It was founded by imperial ukase in 1848, with a view to its being a trading sea-port, and an entrepôt for the agricultural produce of the surrounding country. Considerable privileges were guaranteed to its inhabitants and it has rapidly sprung into importance. Pop. '67, 28,070.

JEJEEBHOY, SIR JAMSETJEE. SEE JEEJEEBHOY, *ante*.

JEJUNUM, that portion of a small intestine which is situated between the duodenum and the ileum, and forming about one-third of the length of this portion of the intestinal tract. It derives its name from the fact that in *post-mortem* examinations it is almost always found empty (Lat. *jejonus*, empty). The mucous membrane of the whole of the small intestine is very vascular, but that of the jejunum is more vascular than that of the ileum, and its coats are also rather thicker. The mucous membrane of this whole tract is also increased in surface by the existence of partial cross-bands called *valvulae conniventes*, but these are much more developed in the jejunum than in the ileum or in the duodenum. In the jejunum these valves increase the mucous surface to double what it otherwise would be, the folds occupying between one-third and one-half of the circumference, and from one-third to one-half an inch wide. See **ILEUM**.

JELALABAD', a t. of Afghanistan, stands near the Cabul, in a fertile plain, which is separated from Peshawur by the famous Khyber Pass. It thus occupies a commanding position on the grand route between India and Central Asia. Pop. about 3,000. The place acquired a historical interest during the Afghan wars, having been heroically held by Sir Robert Sale (1841-42), notwithstanding the fatal disasters of the first expedition, till it was relieved by the triumphant advance of the second. See **AFGHANISTAN**.

JELATOM', **JELATINA**, or **ELAT'MA**, a t. of Rusisa, in the government of Tambov, is situated 158 m. n. of the town of that name, on the left bank of the Oka. Woolen cloths, vitriol, and sulphur are here manufactured. Pop. '67, 7,376.

JELETZ', a town of Russia, in the government of Orel, is situated 110 m. e.s.e of the town of that name, on the Sosna. In the vicinity are extensive iron-mines, and the town has become famous for its wheaten flour, which is exported throughout the whole of Russia. Pop. '67, 30,182.

JELLACHICH DE BUZIM, JOSEPH, Baron, a distinguished Austrian general, and Ban of Croatia, was b. at Peterwardein in 1801. His father, the descendant of an old Croatian family, was a general in the Austrian service, and attained some celebrity in the Turkish wars, and in those of the French revolution. The baron was early

employed in military service on the Turkish frontier, and distinguished himself by his courage and skill. He succeeded also in winning in a high degree the confidence of the Croatians, so that in 1848 the court of Vienna was glad to appoint him Ban of Croatia, in order to secure the support of the Slavonian Croatians against the Magyars of Hungary, and he took a very active part in the suppression of the Hungarian rebellion. He not only displayed talents for government and military command, but also for poetry. He died at Agram, June, 1859. A collection of his poems was published at Vieuna in 1850.

JELLY-FISH. See ACALEPHÆ, *ante*.

JE'LUM. See JHELUM.

JEMAP'PES, a village of moderate size, not far from Mons, in the Belgian province of Hainault, which has acquired a historic celebrity from the victory won here by the French republicans, 40,000 strong, under Dumouriez, Nov. 6, 1792, over the Austrians, who were in nearly equal force. By this victory, the way into Belgium was opened to the French, and the spirits of the army and of the people greatly elevated by the first great victory of their raw levies over the disciplined and experienced Austrian troops. Pop. about 5,000.

JE'NA, a t. in the grand-duchy of Saxe-Weimar-Eisenach, and formerly the capital of the duchy of Saxe-Jena, is most beautifully situated in a romantic valley at the confluence of the Leutra with the Saale. Pop. '75, 8,903. It derives celebrity chiefly from its university, but also from the great battle fought here between the French and the Prussians.—The *university of Jena* was founded about the year 1547 by the elector John Frederick of Saxony, who intended it to supply the place of Wittenberg as a seat of learning and of evangelical doctrine. It soon acquired a high reputation. The imperial authorization was obtained, after some delay and difficulty, in 1558. It is the university of the minor Saxon states, and is supported by contributions from them all. Its library contains upwards of 200,000 volumes. The most flourishing period of the university was that of duke Karl August, a zealous patron of art and science, 1787-1806 A.D. To have obtained academic honors in Jena used to be no small recommendation to employment in other German universities, and many of the most distinguished ornaments of other universities have been students of this. Some of its professors were among the first and most successful supporters of the philosophy of Kant. Fichte founded a new school of philosophy here in 1794, and the names of Schelling and Hegel are also connected with Jena. The brothers Schlegel, Voss, Fries, Krause, and Oken have added to its celebrity in literature and science. The faculty of medicine, as well as those of theology and law, has reckoned many distinguished names. The most eminent theologians in recent times have belonged to the liberal school. There are in all about 70 professors and lecturers, and under 500 students. The *Jenaische Literaturzeitung*, under the auspices of the university, is one of the most valuable literary and scientific journals.

The great battle of Jena was fought in the neighborhood of the town Oct. 14, 1806. The Prussian army, numbering about 70,000 men, was under the command of the prince of Hohenlohe; while the French, commanded by Napoleon, amounted to 90,000. The former were completely defeated. On the same day, Davout defeated the aged duke of Brunswick at Auerstädt, with 30,000 French against 60,000 Prussians, and these two battles decided for a number of years the fate of the Prussian kingdom and of the n. of Germany. The loss of the Prussians on that eventful day and in the conflicts of the preceding days amounted to 50,000 killed, wounded, and prisoners, besides the loss sustained by the Saxons, their allies. The French gave out their loss to be 7,000, including 270 officers.

JENGIS KHAN. See GENGHIS KHAN, *ante*.

JENISEI. See YENISEI, *ante*.

JENKINS, CHARLES J., b. S. C., 1805; received his education at the university of Georgia, and Union college, Schenectady, N. Y. He was elected a member of the Georgia legislature in 1830, and was speaker when his party was in power. Although a Jeffersonian democrat, he supported Harrison for the presidency in 1840, and Clay in 1844. He was appointed in 1860 to fill a vacancy in the supreme court of the state, and held the position during the rebellion. He took a prominent part in the state convention called by president Johnson, in 1865, and was elected governor of the state under the new constitution, retaining the office until 1868, when he was superseded, under the reconstruction acts, by gen. Ruger of the U. S. army.

JENKINS, THORNTON A., b. Va., 1811; entered the U. S. navy in 1828 as a midshipman, and rose to be rear-admiral in 1870; retired from active service, 1873. He served with the Mediterranean, African, and North and South Atlantic squadrons, until 1845, when he was deputed to investigate the light-house systems of Europe. Out of this investigation grew the law of 1852, framed by lieut. Jenkins, and under which the light-house board has been ever since administered. After serving on the coast of South America and in Central America, and in Mexico during the war with that country, Jenkins was promoted to a captaincy in 1862, and did good service during the rebellion. He had an important post at the battle of Mobile bay, and was highly commended in the report of admiral Farragut. In 1865 he was chief of the bureau of navi-

gation; 1869-71, naval secretary of the light-house board; 1871-73, in command of the East India squadron. In 1876 admiral Jenkins had charge of the exhibit of the U. S. navy department in the centennial exhibition at Philadelphia.

JENKS, JOSEPH, d. 1683; b. England; a metal-worker, supposed to have been the first founder and inventor in America, having settled in Lynn, Mass., in 1645. He worked in brass and iron, but experimented in mechanics in different directions, and is recorded as having received a patent in 1646 for an application of water-power to mills. He also invented a saw-mill and a fire-engine. He is said to have made the dies for the pine-tree money issued in Massachusetts in 1652. Jenks had his foundry on the Saugus river at Lynn, and in 1667 was there engaged in wire-drawing, and appears on the records as an applicant to the general court for aid in his business.

JENNER, EDWARD, the discoverer of vaccination, was b. at Berkeley, in Gloucestershire, on May 17, 1749, and was the third son of the rev. Stephen Jenner, vicar of the parish, and rector of Rockhampton. His scholastic education being finished, he was removed to Sodbury, near Bristol, in order to be instructed in the elements of surgery and pharmacy by Mr. Ludlow, an eminent surgeon there; and on the expiration of his term with this gentleman, he went to London, in the 21st year of his age, to prosecute his professional studies under the direction and instruction of the celebrated John Hunter (q.v.), in whose family he resided for two years. Under Hunter's superintendence, he became an expert anatomist, a sound pathologist, a careful experimenter, and a good naturalist. The influence of the master exerted a lasting effect on the pupil; and Hunter's letters, which Jenner carefully preserved, evince the affectionate feeling and community of tastes which subsisted between them. On leaving London Jenner settled at Berkeley, where his sound professional knowledge and kindly disposition soon acquired for him a large amount of practice. In 1788 his well-known memoir, *On the Natural History of the Cuckoo*, appeared in the *Transactions* of the royal society, containing the results of investigations begun at the request of Hunter. A few years afterwards, the fatigues of general practice having become irksome to him, he resolved to confine himself to medicine, and with that view he obtained the degree of M.D. from the university of St. Andrews.

The discovery of the prophylactic power of vaccination, by which the name of Jenner has become immortalized, was the result of a prolonged series of observations and experiments. His attention, whilst he was yet a youth, was forcibly attracted to the nature of cow-pox in the following manner: He was pursuing his professional education in the house of his master at Sodbury, when a young country-woman came to seek advice. The subject of small-pox being mentioned in her presence, she observed: "I cannot take that disease, for I have had cow-pox." This was before the year 1770. It was not till 1775 that, after his return to Gloucestershire, he had an opportunity of examining into the truth of the traditions respecting cow-pox; and it was five years later before he began clearly to see his way to the great discovery that was in store for him. In the month of May, 1780, while riding with his friend Edward Gardner, on the road between Gloucester and Bristol, "he went over the natural history of cow-pox; stated his opinion as to the origin of this affection from the heel of the horse [when suffering from the grease]; specified the different sorts of disease which attacked the milkers when they handled infected cows; dwelt upon that variety which afforded protection against small-pox; and with deep and anxious emotion, mentioned his hope of being able to propagate that variety from one human being to another, till he had disseminated the practice all over the globe, to the total extinction of small-pox."—Baron's *Life of Jenner*, p. 128. Many investigations regarding the different varieties of cow-pox, etc., delayed the actual discovery for no less than 16 years, when at length the crowning experiment on James Phipps (see INOCULATION) was made on May 14, 1796, and Jenner's task was virtually accomplished. This experiment was followed by many of the same kind; and in 1798 he published his first memoir, entitled *An Inquiry into the Causes and Effects of the Variola Vaccine*. Although the evidence accumulated by Jenner seemed conclusive, yet the practice met with violent opposition until a year had passed, when upwards of 70 of the principal physicians and surgeons in London signed a declaration of their entire confidence in it. His discovery was soon promulgated throughout the civilized world. Honors were conferred upon him by foreign courts, and he was elected an honorary member of nearly all the learned societies of Europe. Parliament voted him, in 1802, a grant of £10,000, and in 1807 a second grant of, £20,000; and in the year 1858 a public statue in his honor was erected in the metropolis. His latter days were passed chiefly at Berkeley and Cheltenham, and were occupied in the dissemination and elucidation of his great discovery. He died of apoplexy at Berkeley in Feb., 1823.

JENNER, Sir WILLIAM, b. England, 1815. He was professor of pathological anatomy at University college, London, and professor of clinical medicine in the same institution for many years. In 1861 he was named physician in ordinary to the queen. He was a personal friend of the late prince consort, whose death-bed he attended. He was made a baronet in 1858, and K.C.B. after the recovery of the prince of Wales in 1872. He has published *Gulstonian Lectures*, but his fame will probably rest upon his *Identity and Non-identity of Typhus and Typhoid Fevers*.

JENNINGS, a s.e. co. in Indiana; watered by the branches of the Muscatatuk river; 375 sq.m.; pop. '70, 16,218. It has an undulating surface, and is fertile and productive. It is traversed by the Madison and Indianapolis, and Ohio and Mississippi railroads. Co. seat, Vernon.

JENNINGS, WILLIAM, 1701-97; b. England; gained notoriety and lasting fame from his miserly habits. When a boy he was attached to the personal service of George I. as a page; but on arriving at his majority, he went into retirement on his family estate in Suffolk, where he passed the most of his time, living the life of a hermit, denying himself that he might accumulate wealth. He visited London during the season, making a profitable business of loaning money. He died intestate, his will not being executed, and his immense property, valued at £1,000,000, was never divided, and the disposition of it is still indefatigably claimed by those of his name in England and America.

JENYNS, SOAME, 1704-87; b. London; was educated at Cambridge, and represented Cambridgeshire in parliament, 1742. He became a somewhat noted wit, and wrote poetry; his first work being a poem on the *Art of Dancing*. Dr. Johnson criticised his *Free Inquiry into the Nature and Origin of Evil*. In a later work, *A View of the Internal Evidences of the Christian Religion*, the author narrated his own skepticism and subsequent conversion. This work had formerly the reputation of being the best published argument in favor of Christianity.

JEPHTHAH, ninth judge of the Israelites, B.C. 1256-50, illegitimate son of Gilead, of the tribe of Manasseh. Driven from home by his brothers, who were born in wedlock, he removed to the land of Tob, beyond the Hebrew frontier. He was distinguished for bravery and skill in arms, and was the leader of a number of adventurous men whose fortunes were as desperate as his own. He led a band of brigands, whose profession is considered, in the east, one not destitute of honor if exercised in moderation and against natural enemies, public or private. He was chosen capt. of the Israelitish forces in their opposition to the Ammonites, and accepted the position, with the stipulation that, if victory attended their arms, he should still remain their ruler. His diplomatic dealings with the Ammonites in the preliminary movements have been deemed worthy of notice; they being the original owners of the land, which he claimed by right of conquest, fighting the battle on that issue. He defeated them with great slaughter in several pitched battles, and pursued them to utter discomfiture and rout. He made a vow to the Lord, that if he would deliver the Ammonites into his hands, whoever should come out of the door of his house, in Mizpeh, to meet him on his return, he would offer up to the Lord as a burnt-offering. His daughter met him, and it is written "he did with her according to his vow." There has been much debate whether he sacrificed her life, or dedicated her in perpetual virginity to the Lord. The case remains doubtful; but the belief preponderates with scholars that a ransom, not unusual under Jewish law in cases involving human life, was given in substitute for her life, which thereafter was regarded as devoted to God. The whole drift of the Mosaic law is well known to have been utterly against human sacrifices in the worship of Jehovah. He conquered the Ephraimites, and, controlling the fords of the Jordan, slew all who, on being required as they passed over to pronounce the word "shibboleth" (an ear of corn), gave the word "sibboleth" without the aspirate, thereby revealing themselves as Ephraimites. He was buried in a city of his native Gilead.

JEQUITINHON'HA, a Brazilian river, which falls into the Atlantic near Belmonte, in Bahia, lat. $15^{\circ} 50' S.$, long. 39° west. Its length is about 750 m., and the area of its basin is 19,800 sq. miles. Its course is over a rough and precipitous bed, in several places forming magnificent cataracts, falling from heights varying between 250 and 300 ft., and it is navigable only by canoes between Minas Geraes and Bahia. The main channel of the river is formed by the junction of the Pardo and the Poassú rivers. The principal tributary of the Jequitinhonha is the Arassuai.

JERASH'. See GERASA.

JER'B'A. See GERBI.

JER'BOA, *Dipus*, a genus of rodent quadrupeds, of the family *muridae*, remarkable for the great length of the hind legs, and kangaroo-like power of jumping. The fore-legs are very small, hence the ancient Greek name, *dipous* (two-footed). The tail is long, cylindrical, covered with short hair, and tufted at the end. The jerboas are inhabitants of sandy deserts and wide grassy plains in Asia and the e. of Europe, Africa, and Australia. They are burrowing animals, nocturnal, very destructive to grain and other crops, laying up boards for their winter use. They take prodigious leaps when alarmed; the fore feet are then not used at all, but by means of the hind feet and the tail they leap, although they are small animals, several yards. Their flesh is said to resemble that of the rabbit.—Closely allied to the jerboas are the *gerbils* (*gerbillus*), small quadrupeds, also distinguished by great length of hind legs and power of leaping, inhabitants of the warm and sandy portions of the old world.

JEREMIAH (Heb. *Yirmiyahu*), a Hebrew prophet, was the son of Hilkiah, a priest of Anathoth, a place about 3 m. n. of Jerusalem. He prophesied under the reigns of Josiah, Jehoahaz, Jehoiakim, Jehoiachin, and Zedekiah (630-590 B.C.), and even later. His character and fortunes are clearly discernible in his writings. To him, a man of an

emphatically spiritual, truthful, self-sacrificing nature, it was given to predict in the midst of the both politically and religiously rotten state of the commonwealth, under the successive weak kings, its speedy destruction. Fearless yet hopeless, he delivers his mournful messages from year to year, and battles with despairing heroism against the inevitable. His life thus became one long martyrdom. We read of his enduring "reproach and derision daily" (xx. 8); his townsmen of Anathoth threatened to slay him if he did not stop prophesying woe (xi. 21); his own brethren, the house of his father, "dealt treacherously" with him (xxii. 6); so that his spirit at times failed him. There were two political parties in Judah at this time—in favor of a Chaldean and an Egyptian alliance respectively. Like the earlier patriotic prophets, Jeremiah repudiated both at first. The course of events, however, had necessitated a compromise, and the religious party—gradually decreasing in numbers and influence—had declared against Egypt, and in favor of Chaldea. King Josiah, who belonged to it, perished at Megiddo, in the valley of Esdraelon, in an attempt to stop the progress of Pharaoh-Necho (609 B.C.). After this things grew worse. The Egyptian party became predominant, and Jeremiah was now forced to take a side, and became a partisan as well as a prophet. He speaks of the king of Babylon as God's servant, and prophesies the destruction of the temple. A cry arose from the priesthood and the prophets for his life, and he escaped with difficulty (xxvi.). At last came the judgment. The best portion of the people were carried into captivity; and Jeremiah urged his countrymen to wait for the period of deliverance with religious fortitude and patience. A sudden irruption of the Egyptians drove the Chaldeans out of Judah, and Jeremiah was again exposed to persecution, thrown into a pit to die, and only rescued by the kindness of an Egyptian eunuch. The capture of Jerusalem by Nebuchadnezzar rendered the prophet's position more tolerable. Jeremiah had always preached submission to the Chaldeans. He was even patronized by the conqueror, and offered a home at Babylon, but he preferred to reside among the wretched remnant of the people left in Judah (xl.). Intestine strifes, however, soon drove some to take refuge in Egypt. Jeremiah was carried off along with the exiles, and here he is believed to have died, and his grave was long shown at Cairo. According to others, however, he came back to Judea. The writings of this prophet, dictated by him to Baruch, have been arranged with little regard to order, and the text is in a state of great confusion, notwithstanding that Jeremiah himself undertook two distinct redactions. They exhibit great tenderness and elegiac beauty of sentiment, but lack the sublime grandeur of Isaiah. He often borrows largely from his poetic predecessors. Several of the Psalms have been attributed to him, especially by modern critics. Hitzig numbers 34, which he believes to be the composition of Jeremiah. There is no reason to doubt that the Lamentations are properly ascribed to him, while the apocryphal work of his, mentioned by Jerome (Matt. xxvii.), deserves little notice. Among commentators may be mentioned Origen, Jerome, Theodoret, Oecolampadius, Sanctius, Venema, Michaelis, Umbreit, Henderson, Dahler, Knobel, Ewald, Hengstenberg, and Bunsen.

JEREMIAH, PROPHECY OF (*ante*), though not arranged in the order in which it was delivered may be divided, with some degree of correctness, by the aid of time marks which some of the chapters supply. The introduction contains the title of the book; the period during which its prophecies were spoken; Jeremiah's call to the prophetic office; emblems indicating to him that the judgments to be denounced, coming from the north, would be executed quickly and would be severe; and the exhortation to him to be diligent, faithful, and confident in the protection of God. Part I., comprising prophecies delivered during 18 years of Josiah's reign. The Lord, recounting the loving relations between himself and Israel, reproaches them for having forsaken him and exhorts them to return; Judah is charged with being even more guilty than Israel; Israel, exhorted to repent, is promised a time of deliverance; Judah and Jerusalem are urged to avert, by immediate repentance, the Babylonian invasion which, otherwise, would speedily come, inflicting misery on the people and desolation on the land; are warned not to believe the flattering words of false prophets, or trust to the sacredness of the temple as a defense against the divine judgments; are reminded of the transgressions and idolatries of which they were guilty, notwithstanding the divine instructions and blessings; the desolation of Jerusalem and the other cities of Judah, declared; the confidence of the Jews, as possessors of the law which they transgressed, pronounced vain; Jeremiah overwhelmed with sorrow in view of the calamities which he is compelled to foretell; the vain splendor of idols contrasted with the majesty of God; the terms of the covenant with the people, again declared; condemnation for violating them; destruction pronounced on those who threaten the prophet; Jeremiah, acknowledging the righteousness of the Lord, pleads with him concerning the apparent prosperity of the wicked, and is assured that it will soon come to an end, and that lasting peace can be obtained only by righteous obedience. Part II. Prophecies during the 11 years of Jehoiakim's reign. The destruction of the pride and grandeur of the land foretold under the emblems of a decayed girdle and of bursting wine bottles; the king and queen called on to humble themselves because of the approaching captivity of themselves and their land; a grievous famine predicted, leading to the prophet's confession of the people's sin and his entreaty for their forgiveness, and followed by the assurance that they had

become incorrigible and that prayer for them could not avail; the certainty of their doom illustrated by the prohibition of marriage and of feasting; their ultimate restoration to their land promised; confidence in man condemned and trust in God commended; blessings promised to those who hallowed the Sabbath and judgments pronounced on those who profaned it; a potter working in clay used as an emblem of God's sovereignty in averting threatened judgments when nations repent, and withholding promised blessings when they transgress; the Jews exhorted to avert judgments from themselves by returning to God, refuse, and conspire against Jeremiah's life; his prayer for the interposition of God against them; the breaking of a potter's vessel, in the sight of the princes and priests, as a symbol of the destruction of Jerusalem; the condemnation of Pashur, who had charge of the temple, for his arrest of Jeremiah, and the emblematic name given him signifying "Terror is around," and prefiguring the captivity of himself, his friends, and the nation; Jeremiah's appeal to God for help under the burdens of his office, followed by lamentation over the day of his birth; the doom of Jehoiakim and his family pronounced; a brighter day promised in the distant future under the reign of the righteous king of the family of David, whose name shall be "Jehovah our righteousness"; judgments threatened against false prophets; Jeremiah arrested and declared worthy of death for having proclaimed the word of the Lord against Jerusalem; the obedience of the Rechabites to their father contrasted with the disobedience of the people to God; the prophecies of Jeremiah against Jerusalem burned by the king and rewritten; Nebuchadnezzar's victories foretold over Egypt, Philistia, Tyre, Moab, Ammon, Edom, Syria, and Kedar. Part III. Prophecies during the 11 years of Zedekiah's reign. Conquest of Persia by the Chaldeans foretold, with promise of its final deliverance; the deliverance of the first captives in Babylon and the destruction of Zedekiah and his kingdom foretold under the emblem of good and bad figs; warning to the Jews that their captivity would not be brief, with the assurance of deliverance at the end of 70 years; their return, conversion to their Messiah, and subsequent happiness, promised; the destruction of Babylon foretold; Jeremiah cast into a miry dungeon, and released by the king's command; Zedekiah required to choose between safety for himself and the city if he submitted to the king of Babylon, and destruction to both if he continued to resist; his continued resistance resulting in his blindness and captivity; Jeremiah released by the conqueror's command, with the offer of kind treatment in Babylon or liberty to dwell anywhere else; his choice to continue with the remnant of the people, promising them safety and blessing if they remained at home, but pronouncing their destruction if they went down to Egypt; their persistence in going down, taking him with them.

After this, in the absence of certain knowledge concerning this prophet, there are conflicting traditions that he was stoned to death by his countrymen in Egypt; that he died there, broken down with sorrow; that he returned to Judea; and that he went to Babylon and died there.

JEREZ DE LA FRONTERA, or XEREZ, a Spanish t., situated upon the Guadalete river, in the provine of Andalusia; pop. 38,898. It is noted for the production of the celebrated Xeres wine, which is made from grapes from the surrounding vineyards. Divided into the old and new town, the walls of the ancient Jerez are still standing where Roderick the Visigoth fought a battle with the Moors in 711, and was defeated. The Moore continued in possession of the town until the middle of the 13th c., when it was recaptured by Alonzo the wise. The new town is well laid out, contains three handsome squares, and its streets are well lighted and kept in good order. The cathedral, dating back to 1695, and a few of the churches are interesting buildings. There are 5 convents, a number of monasteries, 5 hospitals, and free schools. The old Moorish castle is a splendid specimen of architecture.

JERFALCON. See GYRFALCON, *ante*.

JERICHO, once one of the most flourishing cities of Palestine, two hours' journey westward from the Jordan, and six hours n.e. from Jerusalem. Westward from Jericho lies a waste tract of limestone mountains, rising in stages; but the immediate vicinity is well watered and fruitful, yielding dates, raisins, balsam, and honey, yet a favorite abode also, in early times, of poisonous snakes. The capture of Jericho by the Israelites on their first entry into Cauaan, its destruction, and the rebuilding of it by Hiel the Bethelite in the reign of Ahab, about 918 b.c., are found recorded in Josh. vi.; 1 Kings xvi. 34. It appears to have been afterwards the seat of a school of prophets (2 Kings ii. 4, etc.). Herod the great resided in Jericho, and beautified it. It was destroyed in the reign of Vespasian, and again rebuilt under Hadrian. In the time of the crusades, it was repeatedly captured, and at last completely destroyed. At the present day, its place is occupied by a miserable village called Richa, or Ericha, with scarcely 200 inhabitants.

JERICHO, ROSE OF. See Rose of JERICHO, *ante*.

JERKED-BEEF, beef preserved by drying in the sun. It is properly called *charqui*, and, like its name, is of Chilian origin, although now made in large quantities in Montevideo, Buenos Ayres, and other places in South America, where the vast droves of cattle on the prairies are available for the purpose. The beasts are slaughtered when in good condition, and the fleshy parts are dexterously pared off in such a manner as to resemble a succession of skins being taken from the same animal. These sheets of flesh, which

are rarely more than an inch in thickness, being exposed to the sun, dry before decomposition commences, and in that state can be kept almost any length of time. Sometimes the charqui is dipped into brine, or rubbed with salt, before being dried. It is largely imported to Cuba, where it is called *tusajo*, for feeding the slaves. The manufacture of charqui or jerked-beef has been introduced into Australia, and in 1862 shipments of it were made from Victoria to the mother-country, with but inconsiderable success—though it contains all the nutritive matter of animal food, and could be sold for about twopence per pound. But other forms of preserved meat (see PRESERVES) have nearly driven jerked-beef from the English market.

JER'KIN-HEAD, a form of roofing which is half-gable, half-hip. The gable generally goes as high as the ties of the couples, above which the roof is hipped off.

JEROBOAM I., d. 935 b.c.; son of Nebat, of the tribe of Ephraim, and the founder of the kingdom of Israel. During the reign of Solomon, he had charge of the public works of Jerusalem, but engaged in a conspiracy against the king, and was forced to flee to avoid punishment. This action on his part was occasioned by his having received the assurance of the prophet Ahijah that, on the forthcoming revolt of the ten tribes, he should be appointed their ruler. Having placed himself under the protection of Shishak, king of Egypt, he returned to Jerusalem after the death of Solomon, when the prophecy of Ahijah was fulfilled by his being elected by the ten revolting tribes to reign over them as king of Israel. Judah and Benjamin remaining loyal to Rehoboam, Jeroboam fortified Shechem, where he set up his altars, while he sought to prevent the tribes reuniting. He fought Judah with success, but was defeated by Abijah. He is spoken of in Scripture as having "made Israel to sin."

JEROBOAM II., was the son of Jehoash, or Joash, and reigned after his father's death, 823–782 b.c. He defeated the Syrians, and wrested Damascus and Hamath from them. He was a worshiper of Baal and promoted idolatry, and his reign, though prosperous, was immoral and cruel.

JÉRÔME, KING OF WESTPHALIA. See **BONAPARTE**, **JÉRÔME**, *ante*.

JEROME, SAINT (EUSEBIUS HIERONYMUS SOPHRONIUS), was b. at Stridon, a town whose site is now unknown, on the confines of Dalmatia and Pannonia, at some period between 331 and 345—probably nearer to the latter year. His parents were both Christians. His early education was superintended by his father, after which he studied Greek and Latin rhetoric and philosophy under *Ælius Donatus* at Rome, where he was also admitted to the rite of baptism. After a residence in Gaul he seems to have revisited Rome; but in the year 370 he had settled in Aquileia with his friend Rufinus. For some unknown reason, he suddenly went hence to the east; and after a dangerous illness at Antioch, which appears to have still further added to the religious fervor of his disposition, he retired, in 374, to the desert of Chalcis, where he spent four years in penitential exercises and in study, especially of the Hebrew language. In 379 he was ordained a priest at Antioch, after which he spent three years in Constantinople in close intimacy with Gregory of Nazianzus; and in 382 he came on a mission connected with the Meletian schism at Antioch (see **MELETIUS**) to Rome, where he resided, until 385, as secretary of the pope Damasus, and where, although already engaged in his great work of the revision of the Latin version of the Bible, he attained to great popularity and influence by his sanctity, learning, and eloquence. Many pious persons placed themselves under his spiritual direction, the most remarkable of whom were the lady Paula, and her daughter Eustochium. These ladies followed him to the Holy Land, whither he returned in 384. He permanently fixed his residence at Bethlehem in 386, the lady Paula having founded four convents, three for nuns, and one for monks, the latter of which was governed by Jerome himself. It was in this retreat that Jerome pursued or completed the great literary labors of his life; and it was from these solitudes, all peaceful as they might seem, that he sent forth the fiery and vehement invectives which marked not only his controversy with the heretics Jovinian, Vigilantius, and the Pelagians (q.v.), but even with his ancient ally, Rufinus (q.v.), and, although in a minor degree, with St. Augustine. His conflict with the Pelagians rendering even his life insecure at Bethlehem, he was compelled to go into concealment for above two years; and, soon after his return to Bethlehem in 418, he was seized with a lingering illness, which terminated in his death, Sept. 30, 420. His original works, consisting of letters, treatises, polemical and ascetical, commentaries on Holy Scripture, and his version and revision of former versions of the Bible, were first published by Erasmus, 9 vols. folio (Basel, 1516), and have been several times reprinted. The best editions are that of the Benedictines, 5 vols. folio (Paris, 1693–1706), and, still more, that of Vallarsi, 11 vols. (Verona, 1734–42). St. Jerome is universally regarded as the most learned and eloquent of the Latin fathers. His commentaries on the Bible are especially valuable for the learning which they display; but his opinions are often exaggerated and fanciful, and through his controversial writings there runs a strain of violent invective, which contrasts unfavorably with the tone of his contemporary St. Augustine. See **VULGATE**.

JEROME OF PRAGUE, the companion of John Huss, whom he surpassed in learning and eloquence, though he was inferior in judgment and moderation, was born at Prague in the latter half of the 14th century. After attending the university of his native town,

he continued his studies at Paris, Cologne, Oxford, and Heidelberg, and in 1399 took out his degree as master of arts and bachelor of theology. His reputation for learning was so great, that his advice was taken by Ladislas II., king of Poland, with respect to the founding of the university of Cracow in 1410; and Sigismund, king of Hungary, invited him to preach before him at Buda. He entered with his whole soul into the contest carried on by his friend Huss against the abuses of the hierarchy and the profligacy of the clergy. His zeal, however, carried him too far; he publicly trampled the relics under his feet, committed to prison the monks who did not share his opinions, and even ordered one of them to be thrown into the Moldau. When Huss was arrested at Constance Jerome hastened to defend him; but receiving no satisfactory answer to a letter in which he had demanded a safe-conduct from the council, he set out on his return to Prague, when he was arrested at Hirschau, in April, 1415, by the orders of the duke of Sulzbach, and conveyed in chains to Constance. Here he was cast into a dungeon, and placed on trial. After some months' imprisonment he recanted his opinions, but subsequently abjured his recantation with horror, and went to the stake with great firmness. He was burned alive, May 30, 1416. Jerome's life has been written by Heller (Tübingen, 1835) and by Becker (Nördlingen, 1858).

JERROLD, DOUGLAS, dramatist, journalist, and miscellaneous writer, was b. in London on Jan. 3, 1803. His early efforts in literature were directed to the theater, and some of his pieces—*Black-eyed Susan* (1829), for instance—still hold possession of the stage. At a later period, he produced several five-act comedies, the best known of which are *Time Works Wonders*, and *The Bubbles of a Day*. Jerrold's reputation stands more securely on his novels, sketches, and essays than on his dramatic works. His *Men of Character* was originally published in *Blackwood*. He joined the staff of *Punch* (1841), and contributed to that periodical *A Story of a Feather*; *Punch's Letters to his Son*; and the world-famous *Caudle Lectures*. Later appeared *The Chronicles of Clovernook*, the kindest and most delightful of all his books, and *St. Giles and St. James*, his most elaborate novel. For several years before his death, he edited *Lloyd's Weekly Newspaper*. He died from disease of the heart, at Kilburn priory, at the age of 55.

Jerrold was a brilliant rather than a great man of letters. His plays are sparkling, but they want body and substance, and uninteresting matter had never perhaps so epigrammatic a setting as in his novels and tales. His reputation as a social wit stands higher than his reputation as a writer. He was greater in society than in his closet. Like a flint, every stroke brought fire from him. See *Life and Remains of Douglas Jerrold* and *Douglas Jerrold's Wit and Humor*, both by his son, William Blanchard Jerrold (Lond. 1858).

JERROLD, WILLIAM BLANCHARD, b. London, 1826; studied art, and effected something in illustration, but had not the taste for it, and gave it up for literature. He wrote sketches for the magazines and weekly papers in London, and in 1847 published his first story, *The Disgrace to the Family*. He contributed leading articles to the *Daily News*, *Morning Post*, and *Lloyd's Weekly Newspaper*; wrote farces and comedies; and in 1857 became editor of *Lloyd's Weekly Newspaper*. In 1858 he published his *Life and Remains of Douglas Jerrold*, and in 1860 *The French under Arms*, and *The Chronicles of a Crutch*; and during the following years wrote novels, sketches of travels, studies of social life—particularly among the poor of large cities—political articles, and plays. His most important work is his *Life of Napoleon III.*, of which the first volume was issued in 1874, and three volumes have been published. Mr. Jerrold was married in 1849 to the only daughter of his godfather, Laman Blanchard.

JERSEY—THE CHANNEL ISLANDS. Jersey is the chief of the group called the Channel islands (q.v.). The other inhabited islands of this group are Guernsey, Alderney, Sark, Herm, and Jethou. The coast is very dangerous, but light-houses are placed on most of the island headlands, and on the dangerous rocks called the Casquets, w. of Alderney. The Chausey islands belong to France. The following table exhibits the area and population of the principal islands:

NAME OF ISLAND.	Acreage.	Acreage Cultivated.	Population.	
			1861.	1871.
Jersey.....	29,000	20,000	56,078	56,627
Guernsey.....	14,000	9,000	29,780	30,593
Alderney.....	2,000	1,000	4,933	2,783
Sark	1,200	400	600	546
Other islands.....			230	92

Physical Geography—Description.—Jersey, which lies 17 m. s.w. of Guernsey, and 16 m. from the coast of France, is of an oblong form, about 10 m. in length and 6 in width. The land is high on the n. coast, and slopes to the s. and east. It is intersected by several small streams. The coast is indented by large open bays on the w. s., and e.; but on the n. by small rocky inlets. The interior is mostly table-land, well wooded, espe-

cially in the valleys along the winding streams. Jersey is divided into 12 parishes. The churches have little architectural pretension, but are generally picturesquely situated. The principal town is St. Helier (q.v.). The small, neat town of St. Aubin lies at the western extremity of the bay of that name. It possesses a diminutive harbor and castle, a good grammar school, and extensive vineyards. Mont Orgueil castle is a grand and imposing mediæval fortress, looking over Gorey harbor. Some parts of it are said to be of the time of Julius Cæsar. It was the prison of Prynne and the parliamentarians, and has been used as a barrack. A good view of the island may be obtained from *hougue bie*, or prince's tower, a building raised on a mound of legendary interest.

ALDERNEY and **GUERNSEY** are described elsewhere (see those heads).

SARK (*Sercq, Gers*). Great and Little Sark are one island, connected by a natural causeway called the *Coupée*. They are lofty table-lands, with precipitous sides. The total length of the islands and rocks is about 5 m.; the greatest width, including Brechou and the Burons, about 3 miles. Sark is 8 m. from Guernsey. The principal objects of interest are the pierced rocks, caverns, and fissures. The caves are very rich in zoophytes. The seigneur is the rev. W. Collings, who resides on the island. There is one parish church, and a lodging-house for visitors, etc. The coast is very difficult of access, the only entrance to the interior being through a *creux* or tunnel cut in the rock.

Geology.—Most of the islands are composed of primary or granitic rocks. Alderney is a mass of syenite, with hornblende, porphyry, and occasional sandstone. The structure of Guernsey is hard syenite to the n., and gneiss to the south. The geology of Jersey is more varied, presenting a mixture of metamorphic rocks, conglomerates, and sandstones, with sycnites and quartzites. Shale and blown sand are also prevalent. Sark is composed of very hard syenite, with veins of greenstone and feldspar. Granite is quarried from all the islands, especially from Guernsey, Herm, and Mt. Mado in Jersey, both for home use and exportation.

The scenery of the Channel islands is exquisitely varied and beautiful; probably in no other area of similar size could be found such a combination of savage rocks and pleasing landscapes.

The climate of the Channel islands is agreeable and suitable to invalids. The prevailing winds are from n. and n.w. The mean annual rain-fall is 35 in. in Guernsey, but the climate is not overmoist, the soil being porous and evaporation rapid. The mean annual temperature of Jersey is 50.8°; of Guernsey, 51.5°, or 2.5° warmer than Greenwich. The range of temperature is very moderate; but the climate of Guernsey is rather more equable than that of Jersey. Aug. is the hottest month; Feb. the coldest. Frost and snow are rare. The autumns are very beautiful; and a second summer, called the *Petit Eté de Saint Martin*, generally sets in about Oct. 10, and lasts till the middle of Dec. Flowering plants and shrubs are a fortnight earlier in the spring than in England.

The produce of the islands is principally agricultural; but horticulture and floriculture are successfully followed—the latter especially in Guernsey. The soil is generally light, deep, and fertile. The system of cultivation is very primitive. The principal manure is sea-weed, which is gathered in vast quantities from the shores, at certain seasons, under strict regulations. Its annual value to Guernsey alone is estimated at £30,000. A great quantity is burned for the manufacture of kelp and iodine.

The land is held in small parcels ranging from 5 to 20 English acres. The principal crops are hay, wheat, turnips, potatoes, mangel-wurzel, parsnips, and carrots. The yield of wheat is upwards of 30 bushels to the acre—the average of England being 24. The Channel islands possess an excellent breed of horned cattle, usually known as Alderneys, remarkable for their small size and symmetry, and for the quantity and quality of the milk which they yield. From 16 to 17 lbs. of butter are sometimes obtained weekly from the milk of 1 cow. Fruit is much cultivated in Jersey, especially the vine, and the peach, apricot, plum, apple; and the pear, particularly the Charenton, attains extraordinary size and flavor in Guernsey. About 30,000 bushels of table-fruit are annually exported from the islands to London and Paris. Shrubs and flowers flourish abundantly. The acclimatization society of London receives favorable accounts from the Guernsey branch of the successful cultivation of the Brazilian arum, for the manufacture of arrow-root, the produce being very large and profitable. Vegetables are plentiful; and the cow-cabbage grows to the height of 10 or 12 feet. The other products of the islands are principally fish, viz., turbot, red mullet, John dory, conger, *laucons* or sand-eels, also lobsters and oysters, large quantities of which are exported. A considerable traffic is carried on in granite from all the islands; the blue granite from Guernsey for macadamizing, and the pink syenite from Mt. Mado, in Jersey, for paving purposes, are highly esteemed, and largely imported into London. The quantity of granite exported annually from the harbor of St. Sampson averages 125,000 tons.

History.—The early history of the Channel islands is mythical and legendary; but it is probable that the earliest inhabitants were Bretons. The islands were under Roman occupation during the 3d and 4th centuries, the name of Caesarea or Jersey (Cæsar's isle) occurring in the Itinerary of the Antonines. Christianity was probably introduced by missionaries from Ireland about 460 A.D.—St. Helerius being the traditional apostle of Jersey, and St. Sampson of Guernsey. Probably, a mixed population of Saxons, Danes, Goths, and Gauls betook themselves to these islands during succeeding centuries, as the

Franks possessed the continent. The islands were taken possession of by Rolf or Rollo previous to his invasion of Normandy. After the Norman conquest the islands were alternately English, under William the conqueror; Norman, under Rufus; English, under Henry I.; and Norman again, under Stephen. With Henry II. the allegiance of the islands reverted to the king, as sovereign of Normandy as well as England; and after the loss of Normandy the islands still remained faithful to England.

John is said to have given a constitution to Guernsey. The islands still belonged ecclesiastically to Normandy, the bishop of Coutances being their diocesan. Edward III. and Henry V. materially weakened the papal bond; but it was not wholly severed till the reformation, after which (in 1658) they were attached to the see of Winchester. In Henry VI.'s time the French held Jersey for six years. During the civil war Jersey was loyal and Episcopal; Guernsey, republican and Presbyterian, and traces of this divergence are still to be found. In 1781, during the first American war, a French expedition, under the baron de Rullecourt, landed in Grouville bay, and marched into the market-place of St. Helier, but was repulsed with loss by the garrison and militia. During the French and American wars the islanders fitted out many privateers, and obtained rich prizes. Smuggling was finally suppressed in 1800. Since the peace the Channel islands have thriven and prospered by commerce and agriculture, and especially by becoming the resort of numerous families from England, who have been attracted thither by the beauty of the scenery or the salubrity of the climate.

Antiquities.—Formerly there were many cromlechs in the islands; the largest remaining are those near Mont Orgueil in Jersey, and at L'Ancresse bay in Guernsey. A few old chapels of Norman architecture remain. The oldest church in Jersey is that of St. Brelade, said to have been built in 1111.

Language.—The vernacular language of the islands is the old Norman-French. It retains its peculiarities of spelling and pronunciation in Guernsey more than in Jersey; where the French, and in Alderney, where the English element predominates in the dialect. French, however, is the language used in the law-courts of all the islands; but English suitors may address the court or examine witnesses in English. The church services are performed in French in the country parishes, but an English service takes place in most of the town churches.

Inhabitants.—The proportion of strangers in Jersey is very large, British being about 13,000, French 2,000; the native population about 41,000, nearly all of whom live in the country. The natives are generally frugal and independent. Society is much divided into cliques; the "sixties" and "forties" in Guernsey are a marked division.

Government and Laws.—Though belonging to the British crown, the islands have a certain independent *status* and action. The principal officer in each island is the *lieutenant-governor*, who is a general officer in the army, and supreme in all military matters; but he has also certain civil and municipal duties. In Jersey especially, his civil jurisdiction is very extensive. He continues in office five years.

The *bailli* or judge is the first civil officer in each island. He is also appointed by the crown, generally for life. He presides at the royal court, and has a casting vote in civil and criminal cases. He originates all measures proposed to the states, and represents the crown in all civil matters. The *jurats* are twelve in number, elected in Jersey by suffrage of rate-payers for life. They sit in all the courts, and have a voice in all deliberations: in Guernsey they are elected by the elective states. The rectors of the different parishes have also a seat in all councils: in Guernsey, however, only eight out of ten have a vote. Besides these officers there are an attorney and a solicitor general in each island, and a high-sheriff, called in Jersey the *vicomte*, and in Guernsey the *prévôt*.

The other members of the "states" or assemblies are, in Jersey, the *constables* of the 12 parishes and the 14 *députés* of the *vingtaine*s, who are elected from the *vingtaine*s of each parish. The *royal court* on each island consists of the bailiff and *jurats*. The "states," not convenient without the consent of the governor, pass *ordonnances*, which are in force for three years; laws intended to be permanent must be submitted to the sovereign. The lieutenant-governor has a *veto* on all questions deliberated.

In Guernsey the "deliberative states" consist nearly of the same body, but there are also the "elective states," a more popular assembly, amounting to 222 persons—the great majority being 200 *douzanières*, elected by the rate-payers of the various parishes. The *douzanières* (originally 12 from each parish) are the managers of all parish matters, and elected for life. The bailiff presides. The lieutenant-governor has no *veto*, and *ordonnances* passed take effect without the royal approbation. The proceedings of the states relate to the internal administration of the islands.

Alderney and Sark, though possessing courts of their own, and jurisdiction in petty offenses, are, with the smaller adjacent islands, under the bailiwick of Guernsey.

The *laws* of the islands are very peculiar, being mainly derived from the ancient customary law of Normandy. The laws relating to property are singular: arrest takes place in Jersey without proof or affidavit. Until recently the queen's writ had no power in the islands, and the act of *habeas corpus* has only lately been admitted. Encroachments on property are sometimes met by a curious appeal called *Ha! Ro! à l'aide, mon Prince!* repeated thrice. It is considered to be the remains of an old appeal to Rollo, duke of Normandy, and is still a valid form of injunction.

Ecclesiastical State.—There is a dean in each island. The livings are in the gift of the crown, and of small value. The principal educational establishments are Victoria college in Jersey, and Elizabeth college in Guernsey. In both a first-class education is given on very moderate terms, by an excellent staff of teachers, and they have various exhibitions at the universities of Oxford and Cambridge.

There is regular steam communication between England and the Channel islands, also between Jersey and the French ports of Granville and St. Malo; and in summer there is generally an excursion-boat once a week to Sark and Herm.

The islands are protected by numerous forts, especially about the harbor of refuge in Alderney.

Books of Reference.—The principal historical authorities are the rev. P. Falle's *History of Jersey*; Mr. Duncan's and Mr. F. B. Tupper's histories of Guernsey; and Mr. Dally for the agriculture of the islands. A more recent and a very comprehensive work is *The Channel Islands*, by D. T. Ansted, M.A., F.R.S., and R. C. Latham, M.A., M.D., F.R.S., etc. (Lond. 1862).

JERSEY, a co. in s.w. Illinois; bounded s. by the Mississippi and w. by the Illinois rivers; traversed by the Chicago and Alton railroad; 350 sq.m.; pop. 15,054. The surface comprises woodland and prairie, the soil being generally fertile; staple products are grain, cattle, and wool; and coal measures occur and are extensively mined. Co. seat, Jerseyville.

JERSEY CITY, a city in New Jersey, United States, on the w. bank of the Hudson river, opposite New York, of which it is, in fact, though in another state, an extension, and to which it is united by large and powerful steam ferry-boats, lighted with gas, which ply night and day. It is the entrepôt of the Cunard and other ocean steamers, and the terminus of six lines of railway, and of a canal for coal-transport. It has manufactories of locomotives, machinery, watches, glass, and crucibles; foundries, breweries, sugar-refineries, etc.; 5 newspapers; and about 60 churches, the finest of which once stood in Wall street, New York, but was removed and carefully built up, stone by stone, in this city. Pop. '60, 29,226; '70, 82,546.

JERSEY CITY (*ante*) stands upon a peninsula once known as Paulus Hook, and used for farming purposes for 150 years before the beginning of the present century. In 1802 it contained but 13 inhabitants, living in a single house. In 1804 the legislature of New Jersey granted a charter to the "associates of the Jersey company," who laid out the place into blocks and streets. Commercially considered, it was from the beginning a dependency of New York, though belonging to another state. In 1820 it had gained so much in population and business that it was incorporated as "the city of Jersey"—a name which is rather an attestation of the commercial aspirations than of the good taste of the corporators. In 1838 it was reincorporated under the name of "Jersey City." It is bounded on the n. by North Bergen, West Hoboken, and Hoboken; s. by Bayonne; w. by Newark bay, Hackensack river, and Penhorn creek; and e. by the Hudson river, which separates it from New York. Its length from n. to s. is about 5 m.; its width from e. to w. about 3 miles. It is for the most part regularly laid out, the streets being wide and crossing each other at right angles. It is the county seat of Hudson co., and its chief public buildings are the city hall, the county court-house and jail, and a commodious market. There are many handsome residences, numerous substantial business structures, excellent school buildings, and a number of fine churches. There are four small public squares, two of them provided with fountains and adorned with trees, another divided by intersecting streets, and the fourth used for military parades. The increase of population from 29,227 in 1860 to 82,546 in 1870 is accounted for in part by the annexation of the cities of Hudson and Bergen, each of which contained more than 7,000 inhabitants. In 1872 the township of Greenville was also annexed, with a population of 2,789. In 1870 the number of families in the city was 16,687; of dwellings, 9,867. Of the total population, 31,835 were of foreign birth, 17,665 being natives of Ireland, 7,151 of Germany, 4,008 of England, and 1176 of Scotland. The Morris canal, which connects the waters of the Delaware with those of the Hudson, has its terminus here. Five lines of railway also approach New York at this point, viz.: the Erie, the Pennsylvania, the Central of New Jersey, the Northern New Jersey, the New Jersey Midland, and the New York and Newark. Commodious and well-appointed steam ferry-boats ply constantly, day and night, between Jersey City and New York, and the work of constructing a tunnel under the Hudson between the two cities has already been begun. The projectors of this enterprise are confident of its complete success. Horse-cars ply between the different sections of Jersey City, and connect it also with Hoboken, West Hoboken, and Bayonne. The city is not a port of entry but a part of the New York customs district, so that its commerce is not separately returned. The Cunard line of English ocean steamers has its place of landing for both passengers and freight at this point, and the immense quantities of coal and iron brought hither by the canal and the railroads create a large business. The manufacturing interests of the city are extensive and important. The principal establishments are the United States watch manufactory, extensive glass works, crucible works, steel works, zinc works, boiler works, machine-shops, foundries, railroad repair and supply shops, locomotive

works, sugar refineries, breweries, planing-mills, manufactories of chains and spikes, medals, car-springs, pottery, soap and candles, saleratus, castor and linseed oils, copper articles, jewelry, fireworks, drugs and chemicals, lead pencils, etc. The business of slaughtering animals for the New York market is carried on in the northern part of the city, near the river front, where an abattoir and stock-yards have been provided for the purpose. Jersey City contains 3 national banks, with a capital of \$1,150,000, 2 state and 8 savings banks, 4 insurance companies, and a trust company with \$200,000 capital. The streets are well paved and sewered and lighted with gas, and the city is supplied with water from the Passaic river. The arrangements for extinguishing fires are of the most improved kind. The assessed value of property in 1873 was \$62,292,138. The bonded debt in 1874 amounted to over \$13,000,000. The public schools are well managed and of a high character. The number of children of school age (5 to 18 years) in 1873 was 30,758; enrolled in day-schools, 16,762; average attendance, 8,320; number of teachers, 250, of whom 232 were women; value of school property, \$674,416. The number of private schools was 30, with 5,973 pupils. The principal charitable institutions are the city hospital, the home for aged women, and the children's home. There are 2 daily and 3 weekly newspapers—2 of the latter German. The number of churches is 60, and the principal denominations are Baptists, Congregationalists, Episcopalians, Methodists, Presbyterians, Lutherans, Roman Catholics, and Universalists. Pop. '80, 120,728.

JERSEYVILLE, a city, the co. seat of Jersey co., Illinois, on a branch of the Chicago and Alton railroad, 50 m. from St. Louis; pop. 2,576. It is built on an elevation, and laid out in broad, shaded streets, with handsome buildings, including 8 churches, a public school, and numerous manufacturing establishments of importance.

JERUSALEM (Heb. *Yerushalem*, Gr. *Hierousalem*, Lat. *Hierosolyma*; called also in Arabic, *El-Khuds* or *El-Kods*, "the Holy"), the Jewish capital of Palestine. Its origin and early history are very obscure. Josephus (*Antiq.* i. x. 2) identifies it with the "Salem" of which Melchizedek (*Gen.* xiv. 18) is called king; but St. Jerome doubts the correctness of this view. Critics are better agreed as to the identity of Jerusalem with Jebusi, the city of the Jebusites (*Josh.* xviii. 28), and we know that the Jebusites retained possession of the strong positions of the hill of Zion for a considerable time after the conquest of Canaan, and even after the storming of Jerusalem (*Jud.* i. 8), while the tribes of Judah and Benjamin occupied the lower city. They were finally dispossessed by David (2 Kings v. 7). The name Jerusalem is first mentioned in *Joshua* x. 1. It lies upon the original border of Judah and Benjamin, the line of which runs through the valley of Hinnom, so that Zion and the northern city lay within the territory of Benjamin. Its historical importance dates from the time of David, who there fixed his residence, calling it by the name of the "City of David," transporting to it the ark of the covenant, and building in it an altar to the Lord, on the place of the apparition of the angel by which the plague was stayed (2 Kings xxiv. 25). The building of the temple under Solomon was the consummation of the dignity and holiness of Jerusalem, which was further enlarged, strengthened, and beautified by this king and by his successors. It suffered a diminution of political importance through the revolt and secession of the ten tribes, from which date its history is identified with that of the kingdom of Judah. It was pillaged (973 B.C.) by Sesac (Shishak) king of Egypt (2 Chron. xii. 9), by Joash king of Israel (4 Kings xiv. 13, 14); and finally (588 B.C.), it was taken, after a siege of three years, by Nabuchodonosor, who razed its walls, and destroyed the temple and palaces by fire (4 Kings xxv.). Having been rebuilt after the captivity (536 B.C.), it was again taken and pillaged under Ptolemy Lagos (320 B.C.), and under Antiochus Epiphanes (161 B.C.), after the well-known and mysterious repulse of Heliodorus (176 B.C.); and Pompey (63 B.C.) took the city on the anniversary of its capture by Nabuchodonosor, put 12,000 of the inhabitants to the sword, and razed the walls to the ground, sparing, at the same time, the treasures of the sanctuary. However, a few years later, they were pillaged (51 B.C.) by Crassus; and from these beginnings dates the continued series of Roman aggressions, which terminated in the complete destruction of the city and dispersion of the Jewish race, under Vespasian and Titus (70 A.D.). From the description of the contemporary historian, Josephus, we learn that at this period, Jerusalem, which occupied the four hills, Zion, Acra, Moriah, and Bezetha (separated from each other by deep valleys or gorges), consisted of three distinct regions—the upper city, with the citadel of Zion; the lower city, which lay to the n., on the hills of Acra and Moriah; and the new city, still further to the northward. The temple stood on the hill of Moriah, and John Hyrcanus built on the north-western angle of this hill, a fortress called Baris, which was strengthened and beautified by Herod, and called "Antonia," in honor of Mark Antony. Herod's own palace stood at the northern extremity of the upper city, and on the eastern angle was an open place called Xystus, surrounded by galleries, and communicating by a bridge with the temple. The environs of the city were adorned with gardens, parks, ponds, and tombs. In the progress of ages, ancient Jerusalem was surrounded by three walls, the direction of which, in some portions of their course, is difficult to be determined, although it is upon this that the controversy as to the authentic site of the Holy Sepulcher (q.v.) mainly turns. The first and most ancient wall surrounded the upper city on the hill of Zion, and joined on its northern side the prodomum of the temple. The second wall, or the wall of

Ezechias, inclosed the hill Acra, around which stood the lower city. It was connected at the south-western angle with the first wall, from which it ran in a semi-circle to the n. and n.e., surrounding the upper city till it joined the fortress Antonia, described above. The third wall, built by Herod Agrippa, which inclosed the hill Bezetha and the so-called new city, appears to have started in the north-western angle of the first wall, probably at the tower called " Hippicus," and to have taken a northerly and north-easterly direction around the new city till it met the north-eastern angle of the temple wall. It thus, for a part of its course, was external to the second wall. The site of the church of the Holy Sepulcher and the hill of Cavalry are thus supposed by the defenders of their authenticity to have been without the wall of Jerusalem as it stood in the days of our Lord—that is, the second wall, although they were taken in by the subsequent extension of the city a short time afterwards, when the third wall was built some distance to the w. of the second, by Herod at Agrippa. The investigation of the exact direction of the second wall has long been an object of desire with biblical antiquaries, and it is probable that the excavations now projected or in progress will remove all uncertainty.

The city destroyed by Titus was rebuilt by Hadrian, but only as a heathen and Roman city, under the name *Ælia Capitolina*, with a temple of Jupiter; not as the capital of the Jewish race, who were forbidden, under pain of death, to visit it. Constantine, under the inspiration of his mother, Helena, took measures to consecrate and perpetuate its Christian memories by ascertaining the sites of the various events in the Passion of our Lord, and erecting on them churches and other suitable memorials of those scenes of the redemption of the world, which thenceforward became an object of pious veneration to pilgrims from every part of the church. On the contrary, Julian the apostate, with the design, according to the contemporary Christian account, of falsifying the prediction of our Lord, that "not one stone should be left upon another," encouraged and assisted the Jews to return and rebuild their ancient capital, an enterprise which, as the same writers—supported, in most respects, by the pagan historian Ammianus Marcellinus (xxiii. 1)—was frustrated by an earthquake or eruption, which the Christians ascribe to divine interposition.

Jerusalem again fell under foreign domination in 614, when it was stormed by the Persian king, Chosroes II. It was restored to the emperor Heraclius in 628; but in 637 it fell into the hands of the caliph Omar, and in 1077 passed under the Turkman domination. During this long period the practice of pilgrimages to Jerusalem was never entirely interrupted. In consideration of a tribute paid by each Christian visitor, a contemptuous permission was accorded for the purpose; but the cruelties practiced on the pilgrims by the Turks being reported in the west, and especially by the fiery enthusiast, Peter the Hermit, aroused the piety and chivalry of Europe, and led to that extraordinary succession of holy wars which, for a time, restored the tomb of our Lord and the city to Christian hands. On July 15, 1099, Jerusalem was taken by assault, and was declared the capital of a Christian kingdom. Through a rapid succession of undistinguished names, with the exception of the first, the celebrated Godfrey of Bouillon, the new sovereignty was precariously maintained until 1187, when it fell once more before the arms of the great Saladin, since which time—if we except the brief and empty pageant in which Frederick II., emperor of Germany, having assumed the title by a collusive treaty with the sultan, entered into Jerusalem in March, 1229—the city can hardly be said to have known other than Moslem rulers. It was retaken by the sultan of Damascus in 1239; and although it was given up, in 1241, to the Knights Hospitalers, they were driven out in the year 1244 by the Chorasmian Turks, by whom the ascendancy of the crescent was finally established. It was captured from the Saracens by the Mamelukes in 1382, but recovered in 1517 by the sultan Selim, whose son, the celebrated Soliman, built the wall which at present incloses the city. Jerusalem is now the seat of a pasha, with the ordinary powers of a Turkish viceroy.

It remains to describe the present condition of the city. It is situated in $31^{\circ} 46' 43''$ n. lat., $35^{\circ} 13'$ e. long., on an elevation of 2,000 ft. above the level of the Mediterranean, from the nearest point of which it is distant 29 m. east. In its present shape it is an irregular square, and is still surrounded by the embattled wall, about $2\frac{1}{2}$ m. in circumference, erected by the sultan Soliman. The modern inclosure, however, is far from coinciding with that of the Jewish period. In addition to the changes produced by the rebuilding of the city under Hadrian, by which the greater part of the region anciently called the new city was excluded, the stream of population in the Christian period having flowed towards the holy places, the modern city has extended considerably towards the west. The four hills on which the ancient city stood are inclosed within the modern precincts; but the portion of the old city which lay n. of Bezetha is now excluded, and the valleys between the hills having been filled up by accumulation of ruins, but little inequality of surface is now observable. The streets are narrow, unpaved, and irregular, and the houses gloomy and unsymmetrical; although, owing to its striking position, especially when viewed from the e., and to the number of minarets and domes which rise above the level of the flat-roofed houses, the general appearance of the city, seen from without, is picturesque and pleasing. There are seven gates, of which the principal are the Jaffa gate, the Damascus gate, the Stephen's gate, and the Zion gate. If lines be drawn between these four gates, the city will be divided into four

parts, which almost coincide with the four quarters into which the population—Christian, Armenian, Jewish, and Moslem—is divided; the Christians occupying the n.w., the Armenians the s.w., the Jewish the s.e., and the Mohammedans the n.e. portions of the space within the wall. Of the population—which is about 18,000—5,000 are Mohammedans; 8,000 or 9,000 are Jews, and the rest are Christians of the various rites. To all alike the city is the seat of many sacred associations. The Jews have seven small and mean synagogues. The Mohammedans, since the days of the first occupation, have held possession of the site of the temple of Solomon, on which the so-called mosque of Omar now stands; and the pasha's seraiyah, or official residence, occupies the site of the tower Antonia. The church of the Holy Sepulcher (see HOLY PLACES), with its inclosure, which is occupied by all the Christian communities in common, has been already described. The Latins possess, for their own worship, the church of St. Savior; it is attached to the Franciscan convent, in which Europeans of all denominations receive ready hospitality. In like manner, the Greeks, Armenians, Syrians, Copts, and Abyssinians have convents or hospitals appropriated to their several communions. That of the Armenians, on Mt. Zion, is said to be one of the richest in the east; and the same communion possess another convent on the reputed site of the house of Caiaphas. The street leading from the eastern or Stephen's gate to the Holy Sepulcher is called the *Via Dolorosa*, and is believed to follow the route of our Lord's sorrowful procession from the hall of judgment to Mt. Calvary. In other parts of the city or its immediate environs are shown the reputed sites of the Mount of Olives, the tomb of the Virgin, the pool of Bethesda, the potter's field, and the sites of almost all the events of the Passion of our Lord or of scenes connected therewith. The authenticity of these sites has been the subject of considerable controversy in later times. (See HOLY PLACES). Beyond its religious associations the modern city possesses few advantages. It is entirely without commerce; and its only branches of industry are the manufactures of soap and of *Jerusalem ware*, viz., chaplets, crucifixes, beads, crosses, etc., made of mother-of-pearl or wood, and sold to the pilgrims, who number from 6,000 to 8,000 annually. Considerable quantities of these articles are also exported to Spain, Italy, and France. The beads are either berries or are manufactured either from date-stones or from a species of hard wood called Mecca fruit. For the use of the Mohammedan pilgrims—for whom the mosque of Omar is only inferior in sacredness to Mecca and Medina—there is a considerable manufacture of amulets of black stone, reputed to be a protection against the plague.

In ecclesiastical history Jerusalem has not filled the space which might at first sight be expected. When the city was rebuilt after its destruction under Titus, the new city, *Aelia*, was so inconsiderable as a Christian community that it became a suffragan see of the metropolitan of Cæsarea. The council of Nice recognized a precedence of honor; but it was not till the council of Chalcedon that the church of Jerusalem was raised to the rank of a patriarchate, with jurisdiction over all the bishops of Palestine. Jerusalem, however, ranked last among the eastern patriarchates. In common with the other eastern churches, Jerusalem followed in the train of Constantinople in its secession from the west. The patriarch of Jerusalem was a party to the decree of union in the council of Florence; but his flock soon fell back into schism; and although the titular rank of patriarch of Jerusalem has been maintained in Rome, the church remained under the care of the Franciscan community, and the Latin patriarch had never resided in Jerusalem, until the accession of the present pope, Pius IX., by whom the duty of residence was re-established. In the year 1841 the governments of England and Prussia united for the establishment of a Protestant bishopric in Jerusalem, the appointment to which rests alternately with England and with Prussia.—See Robinson's *Biblical Researches*; Stanley's *Sinai and Palestine*; Williams's *Holy City*; Richardson's *Travels along the Mediterranean*; Ritter's *Erdkunde*; Sepp's *Forschungen eines Teutschen Reisenden*; on the Patriarchate—Le Quien's *Oriens Christianus*; Mosheim's *Church History*; and in regard to recent exploration, Captain Warren's *Underground Jerusalem*.

JERUSALEM ARTICHOKE, or **TOPINAMBURI**, *Helianthus tuberosus*, a plant of the natural order *Compositæ*, and of the same genus with the common sunflower (q.v.), is a native of Brazil. The word *Jerusalem*, in the English name, is a corruption of the Italian *girasole*, sunflower; the name *artichoke* is merely from a supposed similarity of flavor in the eatable part—the tuber—to the artichoke. The Jerusalem artichoke has straight, simple stems from 8 to 12 ft. high, and many rough, ovate-acute, stalked leaves, and in the end of autumn, but rarely in Scotland, produces yellow flowers resembling those of the common sunflower, but smaller. The thick, fleshy, and knotted perennial root produces pretty closely around it, oval or roundish tubers, sometimes 30 or 50 in number, which are reddish on the outside, and whitish within, in appearance very similar to potatoes. They have a sweetish, mucilaginous taste when boiled, and are much more watery and less nourishing than potatoes. They are, however, very palatable when properly prepared with sauce, and make very good soup. The plant is also useful for fodder for cattle, yielded by its leaves and the more tender parts of the stems. The fiber of the stems may probably be found valuable for paper-making. The stems and leaves contain much niter, and have been used for making potash. The Jerusalem artichoke is scarcely an agricultural crop in Britain, although it is to some extent in

some parts of Europe. It is common, however, in gardens, and was known in our gardens before the potato, to which it in some measure gave place. It is generally propagated by small tubers, or cuttings of tubers, like the potato; and its cultivation is in most respects similar, although the aspect of the plant is very different.

JERUSALEM CHAMBER, the room in Westminster Abbey to which the sessions of the assembly of divines, which during the summer had been held in the chapel of Henry VII., were transferred when the weather became cold. Baillie, one of the Scotch commissioners, describes it "as a fair room about the bounds of the college fore-hall, but wider. At the one end, nearest the door, and both sides, are stages of seats as in the new assembly house at Edinburgh, but not so high; for there will be room but for five or six score. At the upmost end there is a chair set on a frame, a foot from the earth, for the Mr. Prolocutor. Before it on the ground stand two chairs for the two Mr. Assessors. Before these, through the length of the room, stands a table at which sit the two scribes. The house is all well hung, and has a good fire, which is some *daintise* at London. Foranent the table, upon the prolocutor's right hand, there are three or four ranks of forms. On the lowest we five do sit; upon the other, at our backs, the members of parliament deputed to the assembly. On the forms foranent us, on the prolocutor's left hand, going from the upper end of the house to the chimney, and at the other end of the house, and back of the table, till it come about to our seats, are four or five stages of forms, whereupon their divines sit as they please, albeit commonly they keep the same place. From the chimney to the door there are no seats, but a void for passage. The lords of parliament use to sit on chairs, in that void, about the fire."

JERUSALEM CHERRY. There are two species of solanum bearing this name, which are cultivated in gardens as ornamental plants. The best known, is the *S. pseudocapsicum*, brought to England from Madeira in 1596. It is a house shrub, with a rounded top upon a short stalk, all being from 1 to 2 ft. high; leaves lance-oblong; small white flowers developing into bright red berries as large as cherries. It may be raised from seeds or grown from cuttings; seeds sown in the spring will yield fruit the following winter. The dwarf Jerusalem cherry is *S. capricastrum*, and is about half the size of the above, and has an orange tint, rather than scarlet. In England it is raised for Christmas decorations; an improved sort is called *S. hybridum compactum*, used for table decorations.

JERUSALEM, COUNCILS OF. I. The first Christian council (Acts xv.), held about 47 A.D., to consider questions raised in the church of Antioch concerning the obligation of Gentile Christians to observe the Jewish law. By the decision of the council it was declared to be necessary for such Christians to abstain from (1) meats which had been offered to idols; (2) blood and strangled things; (3) fornication. This council seems to have comprised only one church, that in Jerusalem, though this church may have embraced several local congregations in that city, organized, as a church in common. II. In 335 a council, formed of the bishops who had assembled at the consecration of the church of the Holy Sepulcher, restored Arius to fellowship and allowed him to return to Alexandria. III. In 349 Maximus of Jerusalem and 60 other bishops, on the return of Athanasius to Alexandria, revoked the decree against him and drew up a letter to his church. IV. In 399 a council held in consequence of a letter from Theophilus of Alexandria on the decree passed against the Origenists assented to it, and resolved not to have fellowship with any who denied the equality of the Son with the Father. V. In 453, on Juvenal's restoration by the emperor Marcian to the see of Jerusalem. VI. In 553 the acts of the fifth ecumenical council of Constantinople were received by all the bishops of Palestine except Alexander of Abilene, who was consequently deposed. VII. An important council held in Jerusalem was that of 1672. It was convened by Dositheus, patriarch of Jerusalem, and was composed of more than 60 bishops and other officers in his diocese. Its object was to oppose Calvinism which had been introduced into the east by Cyrilus Lucaris. Its measures led to its being charged with favoring Romanism, and occasioned considerable trouble in the church.

JERUSALEM CREED, a form generally supposed to have been adopted by the churches of that city. Some think that it was written by Cyril of Jerusalem, 350 A.D.; others assign it to an earlier date. It is preserved as follows in Cyril's discourses, though, if the text be correct, it confounds Christ's resurrection with his ascension: "I believe in one God, the Father Almighty, maker of heaven and earth, and of all things visible and invisible; and in one Lord Jesus Christ, the only-begotten Son of God, begotten of the Father before all worlds, very God, by whom all things were made, who was incarnate and made man, crucified and buried, and the third day ascended into the heavens, and sat down at the right hand of the Father; and is coming to judge quick and dead. And in the Holy Ghost, the paraclete, who spake by the prophets; and in one holy catholic church; and resurrection of the flesh; and in life everlasting."

JERVIS, JOHN, Earl of St. Vincent, a British admiral, was b. Jan. 9, 1734. He obtained a commission in the navy as lieut. in 1755, and in 1769 commanded the *Alarm* frigate in the Mediterranean. When she was paid off he made a tour of inspection to the naval arsenals of France and northern Europe. He was then appointed to the *Foudroyant*, the finest two-deck ship in the British navy, and engaging the *Pegase*, 74,

off Brest, he took her without the loss of a man. For this gallant exploit he was made K.C.B. In 1787 he was made rear-admiral; in 1793 he commanded the naval part of the expedition against the West India islands, sir C. Grey commanding the troops; and so successful was this expedition that although the French were well prepared and fought desperately, every island fell in succession into the hands of the British. In 1795 he received the command of the Mediterranean fleet; and here, for the first time, he made the acquaintance of Nelson, Hood, Collingwood, Hallowell, Troubridge, etc. On Feb. 14, 1797, with only 15 sail of the line, he fell in, off cape St. Vincent, with the Spanish fleet of 27 sail. Without a moment's hesitation, Jervis determined to engage the enemy, and the battle of St Vincent was fought. The genius of Nelson, however, contributed greatly to the success of the day. For this victory the king created Jervis earl St Vincent, and parliament settled upon him a pension of £3,000 a year. After having, by great firmness, repressed a mutiny off Cadiz, which threatened the loss of the whole fleet, he was compelled by ill health to return home. He was soon applied to by government to subdue the spirit of sedition which had openly manifested itself in the channel fleet; and his endeavors were eminently successful. After having held the appointment of first lord of the admiralty, and for a second time commanded the channel fleet, he retired into private life, and died Mar. 13, 1823. A public monument was erected to his memory in St Paul's cathedral. History has enrolled the name of St Vincent in the first rank of the eminent naval commanders who broke the maritime power of France and Spain, and established the naval supremacy of Great Britain.

JERVOIS, Sir WILLIAM F. D., b. England, 1821; was educated at Woolwich, entered the royal engineers, and completed his studies at Chatham. In 1841 he was ordered to the cape of Good Hope, where he remained seven years employed in engineering duties; and, for a time, in active service against the Boers and Kaffers. Ordered home in 1848 he continued to be employed on important engineering duty, and in 1856 was made assistant inspector-general of fortifications, deputy director of fortifications in 1862, and nominated a commander of the Bath in 1863. Sent in 1864 to report on the defenses of the British provinces in America, he examined also the Atlantic coast forts of the United States. He was appointed governor of the Straits settlements in 1875, but transferred to be governor of South Australia in 1877, a post which he still occupies (1880).

JESH'URUN, or JESURUN, a poetical or symbolical name for Israel, used three times in Deuteronomy and once in Isaiah. The root of the word denotes *straight, right, upright*, and the idea then conveyed by the name seems to be that God recognizes his people as righteous by virtue of their covenant-relation to him, as long as they observed the terms of that covenant. Another high authority derives the word from a root denoting *blessed*, according to which Jeshurun would mean Israel as supremely happy and prosperous.

JE'SI, or IESI (anc. *Aesium*, or *Aesis*), a prosperous manufacturing t. of central Italy, in the province of Ancona, and 15 m. s.w. of the city of Ancona, on the left bank of the river Esina. It is surrounded by walls, has a cathedral, and several other churches and convents. It has manufactures of paper, silk, and woolen hosiery and linen, and a large trade in wine and olives. Jesi is the birthplace of the German emperor Frederick II. Pop. about 20,000.

JESSAMINE, a s.e. central co. of Kentucky, bounded on the s. by the Kentucky river, and intersected by the Kentucky Central railroad; 250 sq.m.; pop. '80, 10,864. The surface is undulating, the soil fertile; productions: wheat, rye, Indian corn, oats, butter, and wool. Co. seat, Nicholasville.

JESSAMINE. See JASMINE.

JES'SANT, in heraldry, springing forth, a term frequently used as synonymous with *Issuant*, rising, as a demi-lion is often represented doing, from the bottom line of a field, or upper line of an ordinary. Jessant is sometimes used improperly for *naissant*, or rising from the middle of an ordinary. The phrase *jessant-de-lis* is used with respect to a strange heraldic device representing a leopard's head *affronté* with a *fleur-de-lis* passing through it. The family of Moreley, Hants, bears sable, a leopard's head argent jessant-de-lis; and gules, three leopards' heads jessant-de-lis or, are the arms of the family of Cantelupe.

JESSE, JOHN HENEAGE, 1815-74; b. England; son of the naturalist, Edward Jesse. He wrote numerous works illustrating periods in English history, all of which are held in repute. These include: *Memoirs of the Court of England during the Reign of the Stuarts*; *Memoirs of the Court of London, from the Revolution in 1688 to the Death of George III.*; *George Selwyn and his Contemporaries*; *Memoirs of the Pretenders and their Adherents*; etc.

JES'SO. See YEZO.

JESSORE, a t. of Bengal Proper, capital of a district of the same name, is 77 m. to the n.e. of Calcutta, in lat. $23^{\circ} 10'$ n., and long. $89^{\circ} 10'$ east. Pop. '71, 8,152. Here, in 1838, was erected, by the zemindars of the neighborhood, a commodious school, in which instruction is given in English, Persian, and Bengali.—The district of Jessore

contains 5,528 sq.m., and (1871) 2,075,021 inhabitants. Salt is obtained from the southern frontier; and sugar and rum are largely prepared from the sap of the palm-tree.

JESSULMERE, a fortified city of Rajpootana, capital of the protected state of the same name, contains about 35,000 inhabitants. It is in lat. $26^{\circ} 56' n.$, and long. $70^{\circ} 58' e.$, being 1290 m. to the n.w. of Calcutta. It has several Jaina temples, and various tanks and wells, the only sources of water-supply.—The *state* of Jessulmere contains an area of 12,252 sq.m., and about 75,000 inhabitants. The country is poor and sterile, and the public revenue is under £9,000.

JESSUP LAKE, 12 m. s. of Enterprise, Orange co., Florida; the seat of a colony of the same name, in the midst of a fertile and beautiful country. The water of the lake is pure and clear, upon a sandy bottom, and fish and game birds abound. The outlet is at St. John's river.

JESUITS, or **SOCIETY OF JESUS**, a celebrated religious order of the Roman Catholic church, which has filled a large space in the ecclesiastical and even the political history of the world. It was founded in 1534 by the well-known Ignatius of Loyola (see **LOYOLA**), in concert with five associates—Peter Le Fevre, a Savoyard; three Spaniards—James Lainez, Francis Xavier, and Nicholas Bobadilla; and a Portuguese named Rodriguez. The original object of association was limited to a pilgrimage to the Holy Land, and a mission for the conversion of infidels; but as all access to the Holy Land was precluded by the outbreak of a war with the Turks, the associates turned their thoughts to a more comprehensive organization, specially designed to meet those more modern requirements which had arisen since the reformation. With this view Ignatius of Loyola, with Lainez and Le Fevre, having meanwhile recruited several new associates, repaired to Rome in 1539, and submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: *Ad maiorem Dei gloriam* (To God's greater glory); and the vow of which, in addition to the threefold obligations common to all Catholic religious orders, of chastity, poverty, and obedience, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country which the pope might indicate to them. The new rule was approved by a bull dated Sept. 27, 1540; and in the following year the association was practically inaugurated at Rome by the election of Ignatius of Loyola as its first general.

The original constitution of the society has undergone so few subsequent modifications that it may be described without specifying these changes. Although it is commonly represented as absolutely monarchical, yet the authority of the general is, in many respects, strictly limited. It is true that the general—who is elected by a congregation of professed members selected for the purpose by the whole body of professed members in the various provinces—holds his office for life; and although he is aided in his government by a council of five assistants from the five chief provinces, he is not obliged to follow their voice, even when unanimous. But, on the other hand, he is strictly bound by the constitutions of the order; nor, although he may dispense in particular cases, is he competent, of his own authority, to annul or to alter any of their constitutions. In like manner, although no instance of deposition has ever occurred, he is liable to be deposed by the sentence of a general congregation, in certain contingencies which are specifically pointed out by the constitutions.

The body over which this general presides consists of four classes: 1. Professed, who, having passed through all preparatory stages, which commonly extend over ten or twelve years, or even a longer period, have solemnly taken the vows described above, including that of obedience to the pope. It is from this class alone that the general and all the higher officials of the society are chosen. 2. Coadjutors, spiritual and temporal—the former—who have completed their studies, and have (seldom before their thirty-second year, or even later) been admitted to holy orders—being designed to assist the professed in preaching, teaching, and the direction of souls; the latter being lay-brothers, to whom the minor and menial offices of the society are assigned. 3. Scholastics, who, having passed through the novitiate, are engaged for a long series of years, either in pursuing their own studies, or in teaching in the various schools of the order. 4. Lastly, novices, who, after a short trial as "postulants" for admission, are engaged for two years exclusively in spiritual exercises, prayer, meditation, ascetic reading, or ascetic practices, and generally in a course of disciplinary training. The administrative and executive government of the society, throughout the various provinces or countries into which it is divided, is intrusted, under the general, to provincials, who are named by the general, and hold office, as do all the other officials, for three years. In each separate province there are three kinds of communities—professed houses or residences, colleges, and novitiates. Not only the superiors of these houses—who are called by different names—but also all the various office-bearers in each, are appointed by the general, who receives at stated intervals—monthly from provinces, quarterly from colleges and novitiates—a detailed report of the character, conduct, and position of each member of the society. In all these gradations the subordination is complete, and the obligation of obedience is immediate and unreserved; and one of the most familiar accusations against the society is, that this duty of blind and implicit obedience

makes the superior the sole and final arbiter of conscience for all his subjects, the judge of good and evil, of virtue and of vice. Nevertheless, whatever may be said of the practical tendency of this relation, the Jesuits and their apologists plead that, both in the rules of St. Ignatius and in the so-called "examen" of the candidate, there is contained, in the duty of obedience to a superior, an explicit reservation for the subject, "unless where the superior should command what is sinful."

Such is the internal organization of this renowned association. The system of training applied to the formation of its members exhibits the most profound knowledge of the human heart, and the most correct appreciation of the religious instincts and impulses of mankind. The long exercises of the novitiate were designed by Ignatius to form the individual character in habits of personal holiness, and practices of personal piety. It was the business of the school and college to form the social character of the future teachers of men, and directors of the destinies of society. To learning carefully adapted to the actual condition and progress of knowledge, they sought to add manners and habits calculated to inspire confidence, and to disarm prejudice and suspicion. Unlike the older orders, they made no parade of a special calling, whether by a peculiar habit, or by peculiar exterior indications of austerity or asceticism. They enjoyed, indeed, in these respects, some exemptions from the more austere practices of other orders. Their churches were but designed as supplementary to those of the parish clergy (whose ordinary costume they adopted as their own conventional dress), without the canonical services, without much imposing or attractive ceremonial, being chiefly appropriated for religious instruction, and for the duties of the confessional. Their casuistry avoided all harsh and excessive rigor; and it cannot be doubted that some of their writers carried it to the opposite extreme. But, above all, they addressed themselves to the great want of their time—education; and through the mastery which they soon obtained in this important field, as well as their eminence in every department of learning, divinity, philosophy, history, scholarship, antiquities, and letters, they attained to unbounded influence in every department of society. It may be added that to their extraordinary success in thus drawing to themselves, for education, the youth of every country into which they were introduced, the historians of the society ascribe much of the opposition which they encountered from the universities and collegiate bodies whose monopolies they invaded.

The organization of the society is settled, in every important particular, by the original rules and constitutions of St. Ignatius. The opponents of the Jesuits, however, allege that, in addition to these public and avowed constitutions, there exists in the society, for the guidance of their hidden actions, and for the private direction of the thoroughly initiated members, a secret code, entitled *monita secreta* (secret instructions), which was meant to be reserved solely for the private guidance of the more advanced members, and which was not only not to be communicated to the general body, but was to be boldly repudiated by all, should its existence at any time be suspected or discovered. This singular code, a master-piece of craft and duplicity, was first printed at Cracow in 1612, and has been repeatedly reprinted by the enemies of the Jesuits; but it is indignantly disclaimed by the society. The accounts of the time and circumstances of its discovery are suspicious and contradictory. The book has been repeatedly condemned, both at Rome and by other authorities, as well as by the society, and its apocryphal character is now commonly admitted (see Barbier, *Dictionnaire des Anonymes*).

The history of the society is so varied in the different countries that it is necessary, although very briefly, to allude to each separately, dividing it into three stages—the rise, the suppression, and the restoration of the order.

In Italy, its early career was brilliant and unclouded. Before the death of the first general—Ignatius—in 1556, the Italian Jesuits had swelled to 1000 in number, and the order was established in twelve provinces. Their first check in Italy occurred in Venice. In the contest of this republic with Paul V. (q.v.), the Jesuits, taking the side of Rome, accepted in 1606 the alternative, proposed by the senate, of leaving the Venetian territory; nor was it till 1656 that they were re-established in Venice, from which time they continued to enjoy undisturbed influence in Italy until the suppression of the order.

The earliest settlements of the Jesuits, outside of Italy, were in Portugal and Spain. In 1540 Rodriguez—who was a Portuguese nobleman—and Francis Xavier opened colleges in Portugal, at the invitation of the king. Francis Borgia, duke of Gandia, in Spain, was equally well received in his native country, where the order flourished so rapidly, that, at the time of the suppression, the Spanish Jesuits numbered above 6,000.

In France, although a house for novices was founded in Paris by St. Ignatius in 1542, the university of Paris opposed their introduction as unnecessary and irreconcileable with its privileges. They were distasteful to supporters of the Gallican liberties, and still more to the Huguenots. The jurists, the parliament, and the partisans of absolutism were alarmed by the free political opinions which had found expression in some of the Jesuit schools. On the other hand, the democratic party attributed to them a sinister use of their influence with courts. And thus their progress in France was slow, and their position at all times precarious. It was with much difficulty that the parliament of Paris consented to register the royal decree which authorized their establishment. In more than one instance the university protested against their schools as invading its

privileges. In the wars of the League they did not fail to make new enemies; and at length the assassination of Henry III. by Clement (although no evidence of any connection with the Jesuits appeared in his case), and the circumstance, still more industriously urged against them, that Chatel, who attempted the life of Henry IV., had at one time been a pupil in their schools, led to their expulsion from France in 1594. They were reinstated, however, in 1603; but, on the assassination of Henry IV. by Ravaillac, the outcry against them was renewed. Although it seems quite certain that this clamor was utterly without foundation, yet the opinions held by one of their order, Mariana (q.v.), on the right of revolt, although condemned by the general, gave a color to this and every similar imputation. A less deep but more permanent and formidable movement against them was gradually stirred up at a later period, by a combination of all the causes of unpopularity already described, to which new point was given by the well-known Jansenist controversy, and by the questions as to the imputed laxity of the moral teaching of the Jesuits, and their alleged corrupt and demoralizing casuistry. What the ponderous and indignant prelections of the Sorbonne, and the learned folios of the Dominican and Augustinian schools had failed to accomplish, the wit and brilliancy of the celebrated *Lettres Provinciales* of Pascal (q.v.) effectually achieved. The laxity of some of the Jesuit casuists was mercilessly exposed by this brilliant adversary, who represented it as the authorized teaching of the order, and the crafty maxims and practices popularly ascribed to the society were placed before the world in a light at once exquisitely amusing and fatal to the reputation of the body. The attempts at rejoinder on the part of the Jesuits but served to fix the ridicule more firmly. Of the thousands who laughed at the happy humor, or sympathized with the vigorous raillery of Pascal, few, indeed, could plod through the learned but heavy scholasticism of his adversaries. In vain the Jesuits insisted that the obnoxious casuists had been condemned by the society itself; in vain they showed where their opinions differed from those imputed to them. The wit of Pascal remained unanswered; and whatever were the logical merits of the controversy, no doubt could be entertained as to its popular issue. The pungent pleasantries, too, of the *Provincial Letters* were but a foretaste of the acrimony of the later Jansenistical controversies, in which the Jesuits stored up for themselves an accumulation of animosities in the most various quarters, the divines, the lawyers, the courtiers, which were destined to bear bitter fruit in the later history of the society in France. Nevertheless, after a long conflict, they enjoyed a temporary triumph in the last years of the regency and the beginning of the reign of Louis XV.

In Germany the Jesuit institute was received with general and immediate favor. In the Catholic territories, Austria, Bavaria, and the Rhenish principalities, they not only founded colleges and other establishments of their own, but they were appointed at Ingolstadt and other universities to hold important professorships, and received in many dioceses the charge of the episcopal seminaries then newly established. Before the death of the first general—St. Ignatius—the order could reckon in Germany twenty-six colleges and ten professed houses; and Lainez, the second general, was able to say that there was scarce a German town of note which had not a Jesuit college. In the mixed states their career was not so unclouded. Their great learning and ability, and their thorough devotion to the church, made them at once eager and formidable polemics. In Hungary and Transylvania much bitterness arose out of their introduction; the same may be said of Bohemia and Moravia; and, through the whole course of the thirty years' war, the Jesuits, though in many instances wrongfully, were regarded by the belligerent Protestants as the soul and center of the Catholic camp.

In the Netherlands they encountered some opposition at first; but in 1562 Lainez, the second general of the order, came to the Low Countries, and a college was opened at Louvain, which eventually became one of the greatest colleges of the order. In the Netherlands the Jansenistical party was less numerous and less influential than in France, and the conflict with them was less permanently prejudicial to the Jesuits. In the Protestant kingdoms the Jesuits obtained entrance only as missionaries, and in some, as in England, Scotland, and Ireland, under circumstances of great difficulty and peril. From England they were excluded by the penal laws under pain of death; nevertheless, with a constancy and devotedness which it is impossible not to admire, they maintained through the worst times an unbroken succession of missionaries in many parts of England. They often resorted to the most singular disguises, and generally bore false names; and several of the old Roman Catholic mansions still show the "priest-hole," which was contrived as a retreat for them in cases of sudden emergency. Into Ireland they effected an entrance almost at the first foundation, and after many vicissitudes, towards the close of the reign of Charles II., they had more than one considerable college for the education of youth.

But a still more fertile field for the enterprise of the order was that of the missions to the heathen, in which they outstripped all the older orders in the church. In the Portuguese colonies of India the successes of Francis Xavier (q.v.) are well known. The results of their missions in China and Japan (see Ricci SCHALL) were even more extraordinary, as also in Northern and Central America. Above all, their establishments in the southern continent, in Brazil, in Paraguay and Uruguay, upon the Pacific coast, in California and the Philippine islands, were missions of civilization as much as of religion; and sir

John Bowring recognizes in the present condition of the native population of the Philippines to the present day the results of the judicious labors of the early Jesuits.

Such was this association in the first stage of its history. At their first centenary jubilee the members already numbered 13,112, distributed over 32 provinces. At their suppression, a century later, they had increased to 22,589, and were possessed of 24 professed houses, 669 colleges, 176 seminaries, 61 novitiates, 335 residences, and 275 missionary stations in infidel countries, or in the Protestant states of Europe.

The decline in the fortunes of the Jesuits was rapid and decisive in its consummation. The first blow which they sustained was in Portugal. An exchange of colonial territory having been effected between that kingdom and the crown of Spain, the so-called "reductions" of Paraguay (q.v.), in which the Jesuit missionaries possessed an authority all but sovereign, were transferred to Portugal. The native Indians having resisted this transfer, the Portuguese ascribed their disaffection to the Jesuit missionaries. The Portuguese minister, Pombal de Carvalho, to whom the Jesuits allege that their possessions in Portugal had long been an object of desire, instituted a commission of inquiry; and while it was still pending, an attempt on the life of the king, Joseph, which was laid to the charge of the Jesuits, furnished him with a fresh ground of impeachment; and without waiting any juridical proof of either accusation, he issued, in Sept., 1759, a royal decree, by which the order was expelled from the kingdom. This example was followed in other kingdoms. In France, under the duke de Choiseul, the immediate occasion of the disgrace of the Jesuits was a trial in the civil courts. Father Lavalette, as procurator of the order in Martinique, had consigned to a commercial house in Marseilles two valuable cargoes, which were seized by English cruisers, and Lavalette being unable to meet the bills, the Marseilles merchants proceeded successfully against the order. The Jesuits replied that Lavalette acted not only without the authority of the order, but against its positive constitutions, and appealed to the parliament of Paris against the sentence. The inquiry thus raised presented an opportunity of which the ancient enemies of the order in the parliament eagerly availed themselves. A report on the constitutions of the society, highly damnable, was speedily drawn up, and a demand was made for the suppression of the order, as being irreconcilable, in its constitution and practice, with the interests of the state and of society. A strong effort was made to arrest the proceeding; but a powerful court-faction, aided by the secret influence of the royal mistress, Mme. de Pompadour, who was irritated by the refusal of her Jesuit confessor to grant her absolution unless on condition of her separating from the king, and supported in the press by the philosophic party, carried all voices, public and private, against the Jesuits. An attempt at compromise was proposed to the general, father Ricci, by which the obnoxious constitutions might be abolished or modified; but his unbending reply, "*sint ut sunt, aut non sint*" ("let them be as they are, or let them cease to exist"), cut short all negotiation; and a royal edict was published in 1764, by which the society was suppressed in the French territory. This example was followed by Spain in 1767, with circumstances of great harshness and severity; and by the minor Bourbon courts of Naples, Parma, and Modena. The court of Rome had zealously but vainly interposed in their behalf, and from Clement XIII. especially they received earnest support. But his successor, Clement XIV. (q.v.), inclining in this and all other questions of church and state to the side of peace, having in vain endeavored to procure from the courts by which they were condemned a relaxation of their severity, and being pressed by the ambassadors of France and Spain, at length issued, July 21, 1773, the celebrated bull, "*Dominus ac Redemptor Noster*," by which, without adopting the charges made against the society, or entering in any way into the question of their justice, acting solely on the motive of "the peace of the church," he suppressed the society in all the states of Christendom. The bull was put into execution without delay. In Spain and Portugal alone the members of the society were driven into exile. In other Catholic countries they were permitted to remain as individuals engaged in the ministry or in literary occupations; and in two kingdoms, Prussia under Frederick the Great, and Russia under Catherine, they were even permitted to retain a quasi-corporate existence as a society for education.

What was meant, however, to be the suppression of the society, proved but a temporary suspension. The ex-members continued in large numbers, especially in the Papal states and northern Italy; and soon after the first storm of the revolution had blown over measures began to be taken for the restoration of the society. The first overt reorganization of them was in 1799, by the duke of Parma, at an inconsiderable town called Colorno, in which one of the earliest novices was the afterwards celebrated Angelo Mai. This proceeding on the part of the duke of Parma was barely tolerated by the pope; but in 1801 Pius VII. permitted the re-establishment of the society in Lithuania and White Russia, and with still more formality in Sicily in the year 1804. It was not, however, until after the restoration, and the return of Pius VII. from captivity, that the complete rehabilitation of the Jesuit order was effected by the publication of the bull *Solicitudo Omnium Ecclesiarum*, Aug. 7, 1814. In the same year they opened a novitiate at Rome; and in 1824 their ancient college, the Collegio Romano, was restored to them. In Modena, Sardinia, and Naples they were re-established in 1815, as also in Spain, where their ancient property and possessions were restored to

them. They were again suppressed by the Cortes in 1820, and again restored in 1825; but at the final change of public affairs in Spain in 1835, the Jesuits shared the fate of the other religious establishments which fell under the double influence of revolution and retrenchment. In Portugal they have never obtained a firm footing. Dom Miguel, in 1832, issued a decree for their restoration; but almost before they had entered into possession, the order was reversed by Dom Pedro in 1833. Their position in France has been one of sufferance rather than of positive authorization; nevertheless, they are very numerous and influential, and their educational institutions hold the very highest rank. In Belgium they established themselves after the revolution, and they now possess many large establishments, professed houses as well as colleges, which are very numerously attended by the Catholic youth, as well of Belgium as of other countries. In Holland, also, they possess several considerable houses, as well as in England, Ireland, the United States, and, within a recent period, Scotland. In Switzerland they opened in 1818 a college at Fribourg, which became a most flourishing establishment, and subsequently they extended themselves to Schwyz and Lucerne; but the war of the Sonderbund (one of the main causes of which arose from the Jesuit question) ended in their expulsion from the Swiss territory. Of the German states, Bavaria and Austria tolerated their re-establishment for educational purposes. In the Italian provinces of the former, as also in the Tyrol, they had enjoyed a certain freedom until the revolution of 1848. In Russia they were placed under sharp restrictions in 1817; and a few years later, 1820, in consequence of their successful efforts at proselytism, they were banished by a final ukase from the Russian territory, whence they still remain excluded. The Italian revolution of 1848 seriously affected their position in that country. In that year Pius IX. found it expedient to permit the breaking up of the college and other houses in Rome. They returned, however, with the pope himself, and resumed possession of their ancient establishments. On the proclamation of the kingdom of Italy, they withdrew from Sardinia, Naples, Sicily, and the annexed territories in general. In the recent legislation of the kingdom of Italy, the Jesuits have been visited with a special measure of repression. While each of the other principal religious orders is permitted to retain its "mother house" at Rome, in which the general of the order may reside, the Jesuits have been required to quit their principal convent of the Gesu. In Germany also they have been treated with exceptional severity, being held responsible as the main agents and advisers of the measures adopted in the Vatican council, which are complained of by the government as infringing the rights of the state. By the law of July 4, 1873, the order is excluded from the empire; its establishments are abolished; and all foreign Jesuits are ordered to be expelled, and the German members of the society, as well as of kindred orders and congregations, to be "interned."—The literature of the history of the Jesuits, whether hostile or friendly, is almost endless in extent and variety; we shall only refer to two of the most recent works on either side—Gioberти's *Il Gesuita Moderno*, 1847, and Cretineau Joly's *Histoire de la Compagnie de Jesus*, 1845. See also *Die Preussischen Kirchen-gesetze des Jahres*, 1873, mit Einleitung und Kommentar, by Dr. Paul Hinschius (Berlin, 1873).

JESUITS (ante). The religious instructors of the first Catholic settlers of Maryland were Jesuits who came with lord Baltimore from Europe. John Carroll, born in Maryland, while receiving his education in France became a member of the society of Jesuits, and was with some other Americans completing his studies when the order was suppressed. At the commencement of the American revolution he returned to the United States, and after the establishment of peace he was appointed vicar-general. The progress of the Jesuits in the United States since that time has been rapid. They are divided into two provinces, those of Maryland and Missouri, and several missions. The province of Maryland has establishments in Maryland, Virginia, Pennsylvania, Massachusetts, and the district of Columbia. The province of Missouri has establishments in the dioceses of St. Louis, Cincinnati, Chicago, and Milwaukee. The mission of New York, founded by the province of France, is now independent, and has establishments in the state of New York, Canada, and the Indians of lake Superior. The province of Germany has a mission which operates among the Germans of New York and Ohio. The mission of New Orleans, established by the province of Lyons, has several monasteries and colleges in New Orleans and Mobile. The provinces of Naples and Turin have numerous missionaries in Colorado, New Mexico, California, and among the Rocky mountain Indians. The colleges of the Jesuits in the United States are: St. John's, Frederick, Md.; Loyola, Baltimore; St. Louis university, St. Louis, Mo.; college of the Immaculate Conception, New Orleans; St. Charles's, Grand Coteau, La.; Spring Hill, Alabama; St. Joseph's, Bardstown, Ky.; Gonzaga, Washington, D. C.; St. Ignatius college, San Francisco; Santa Clara, Cal.; St. Joseph's, Philadelphia; St. John's, Fordham, N. Y.; St. Francis Xavier, New York; college of the Holy Cross, Worcester, Mass. The Jesuits in the United States in 1874 numbered 1062.

JESUITS' BARK. See CINCHONA.

JESUP, MORRIS KETCHUM, b. Conn., 1830; has been a member of the New York chamber of commerce, president of the Five Points house of industry and of the young men's Christian association, and manager of the Presbyterian hospital. He is a public-

spirited citizen of New York, one of a class devoting much time and thought to the advancement of charitable enterprises and the support of benevolent institutions.

JESUS, the Greek form of the Hebrew word *Joshua, Jehoshua, "Jehovah, the Savior,"* is the name given to the son of the Virgin Mary by the angels who announced his approaching birth (Matt. i. 21; Luke i. 31). The reason of the name was at the same time declared: "for he shall save his people from their sins."

The date of the birth of Jesus is now generally fixed a few years—at least four years—before the commencement of the Christian era. The reasons of this opinion we cannot here state, but it may be observed that the reckoning of dates from the birth of Christ did not begin till the 6th c., when error on such a point was very probable. The precise date of the birth of Jesus, however, cannot be determined, nor can the year of his death be much more confidently stated. The common computation fixes his death in 33 A.D., or when he was probably at least 37 years of age. As to the month or day of the birth of Jesus, nothing is known, although the circumstance that shepherds were watching their flocks by night makes it very certain that it did not take place at that time at which the festival of Christmas (q.v.) is held.

With the accounts given by the evangelists of the birth of Jesus, his ministry, death, resurrection, and ascension into heaven, every one may be supposed familiar.

The opponents of Christianity have not, in general, disputed the historic truth of the gospel narrative of the life of Jesus; the miracles of course excepted. Celsus and other heathen writers admitted even the truth of the miracles, but alleged them to have been wrought by magic, or to have been too few and inconsiderable to attest the claims of Jesus. Their modern successors have, of course, rejected these views. Some of them have endeavored to show that Jesus was ambitious of earthly power, but this has not been a prevalent theory. More generally they have regarded him as merely adapting his conduct and teaching to the notions common among the Jews, and in particular to their expectation of the Messiah; whilst they admit the unequalled excellency of the religious and moral system taught by him. The inconsistency of this scheme is held to be obvious by orthodox theologians. They allege that it represents the noblest and purest system of morality as based on imposture. The character of Jesus, as displayed both in his life and in his teaching, is one of the great arguments relied on by the advocates of Christianity.

The correspondence of Jesus with Abgarus, king of Edessa, although we have it in Eusebius, can only be ranked with monkish legends. Of no greater value are descriptions of the personal appearance of Jesus, and pictures of him. See CHRIST, PICTURES OF.

JESUS, COLLEGE OF, Oxford. In 1571 queen Elizabeth, on the petition of Dr. Hugh Ap-rice, or Price, granted a charter for the foundation of Jesus college, in which there were to be a principal, eight fellows, and eight scholars. In 1622 king James I. granted the college a new charter, including a code of statutes. These original foundations were set on a new footing in 1685 by the will of sir Leoline Jenkyns, who added considerable endowments to the college, but arranged that the greater part of the fellowships, scholarships, and exhibitions should be confined to Wales. The endowments were subsequently increased to 19 fellowships, and 18 scholarships. The commissions under 17 and 18 Vict. c. 81, converted five of the fellowships into scholarships, and entirely suppressed one fellowship. Of the remaining fellowships one moiety was confined to the principality, and the other thrown open. Four may be lay fellows; the others must take orders within one year after they shall be of sufficient standing to be masters of arts. The scholarships are confined to Wales, with the exception of king Charles I.'s scholarships (confined to Jersey and Guernsey), and two others, which are open. There are nearly thirty exhibitions in this college, of about £40 per annum. This college presents to about 20 livings, and has ordinarily about 200 names on the books. This was the first Protestant college, and in its statutes the Protestant religion was asserted and guarded by many enactments.

JESUS CHRIST (JESUS. ante), the name given in the New Testament to the son of God incarnate (see INCARNATION). Jesus being the Greek form of the Hebrew Joshua, signifying Jehovah the Savior, and Christ the Greek translation of the Hebrew Messiah, signifying the anointed. Matthew's gospel gives a table of his human descent, traced from Abraham and David to Joseph, the husband of Mary; Luke's table, reversing the order, begins with Joseph and ascends to David, Abraham, and Adam, as created immediately by God. Both evangelists give accompanying statements, involving the truth that Jesus was not Joseph's son (Matt. i. 18-25; Luke i. 26-35: ii. 33, 34: iii. 23). The fact that these tables contain different names from David to Joseph has perplexed commentators and others who have sought to harmonize the statements. The limits of this article permit a reference only to two of the many suggestions that have been made: 1. That while Matthew gives the genealogy of Joseph and mentions in each case the actual father, Luke's table contains Mary's ancestors. This view is consistent with the language which Luke employs. If Mary was the daughter of Heli, Joseph was by marriage his son. And that Mary's genealogy should be given seems reasonable and even necessary in order to show that Jesus was actually descended from David; only his legal descent from him being shown by Joseph's genealogy in Matthew's account. 2. The

chief importance of these tables was, at the beginning, in order to satisfy the Jews that Jesus was the son of David. They, when the gospels were first published, were much better able to judge concerning the accuracy of the tables than we are now; and there is no evidence that they impugned it or denied that Jesus was the son of David. For other nations, and at this day, when the truth of Christianity and the Scriptures is attested by so many proofs, it is sufficient to keep in mind that these tables were probably family records, which, in the nature of the case, were likely to be true, and may therefore be accepted as such, even when, in our ignorance, they cannot be explained. The divine conception of the human nature of Jesus is the central fact of Christianity as God's salvation for mankind. As such, it needed to be fully proved; and God's proof of it was addressed by special revelation to the two persons most directly and mutually concerned; to Mary before it occurred, and to Joseph afterward. Both needed to be divinely assured of it, that their peace and welfare might be secured, and that they might become the two witnesses by the record of whose united testimony the truth should be certified to all the world. The fact having been thus proved and the testimony recorded, no additional mention of it is afterwards found in Scripture; yet all the New Testament is in harmony with it and implies it. The birth of Jesus at Bethlehem, fulfilling Micah's prediction made 700 years before, was in a room occupied by dumb animals outside of the crowded khan. Yet it was heralded by Gabriel to the shepherds and by the song of the heavenly host. His presentation in the temple was among the children of the poor, yet it was signalized by the benedictions and prophecies of Simeon and Anna. The star seen by the eastern magi guided them with their homage and offerings to his feet. The transient flight into Egypt afforded him refuge during the little that remained of Herod's cruel and criminal career. His presence in the temple when 12 years old, the age at which a Jewish child became "a son of the law," remarkable at the time for his questions and answers that astonished the learned teachers in the midst of whom he sat, was yet more grandly illustrated to future ages by the one recorded utterance of his childhood which it occasioned: "Why did you have to seek me? Did you not know that it was necessary for me to be in the places and among the affairs which belong to my Father?" This sentence marked his consciousness of the higher nature which glowed within him, and of his earthly work. It contains the germ of the character and life ascribed to him in the gospels, which are without inconsistency or imperfection in thought, word, or deed. Of his residence in the seclusion of Nazareth three facts are recorded: his subjection in his youth to Joseph and Mary; his progress in wisdom and stature and in favor with God and man; and his occupation in early manhood as "a carpenter." The way for his public ministry was prepared, as prophets had foretold, by the brief mission of John the baptizer. His baptism at the Jordan, administered by John in compliance with his own direction to do it promptly, was followed by the baptism of the Holy Ghost and the attestation from heaven, "This is my beloved Son." His special temptations in the wilderness represented several of the chief classes of temptations to which mankind are liable: to seek sustenance desperately in doing wrong; to be presumptuous instead of submissive; and to aim at worldly success by yielding to Satan or any other the worship and service due to God alone. His public ministry in Jerusalem was introduced and closed with similar symbolic acts of cleansing the temple by driving out the traders in animals and money who had gradually established themselves in its courts. At the first, when the Jews asked him for a sign to justify his course, he pointed them onward to the end, when his resurrection from the dead would vindicate his claim "Destroy this temple [his body], and in three days I will raise it up." At the last, when they asked for his authority, he pointed them back to the beginning of the proofs that the kingdom of God was at hand: "The baptism of John, was it from heaven or of men?" The mighty works which he wrought were not violations of the laws of nature, but exercises of power in the various departments of nature through a superhuman administration of its laws—such superhuman administration being the surest, mightiest, most fundamental law in nature. He turned water into wine; so does he habitually, throughout the vineyards on a thousand hills by the chemistry of earth and sky, turn water into the blood of the grape: he stilled the winds and waves on the sea of Galilee; so does he make the storm a calm on the broad oceans of the world: he multiplied five loaves for 5,000 men; so does he year by year, in myriads of harvest fields, multiply grain into food for man and beast: he healed diseases through all Galilee; so does he maintain health-giving and healing processes in every land: he gave limbs to the maimed; so does he give them to the millions who, consequently, are not destitute of them: he conferred sight upon the blind; so has he conferred it on all who are not blind: he restored life to the dead; so has he imparted it to the living, all of whom once were without it: he cast out evil spirits, suffering them not to speak; so are they everywhere subjected to his will. The works of which a particular account is given in the gospels are only specimens of a much larger number, some estimate of which may be formed from three general statements, all relating to the beginning of his public life: in Capernaum, "all that had any sick with divers diseases brought them to him, and he laid his hands on every one of them and healed them;" "he went about all Galilee, healing all manner of sickness and all manner of disease;" "his fame went throughout all Syria, and they brought unto him all sick people that were taken with divers diseases and torments, and those that were possessed with devils, and those that were lunatic,

and those that had the palsy, and he healed them." The teaching of Jesus announced a pure and perfect morality, in the midst of abounding corruption and of merely external righteousness; it proclaimed the law of love to others, instead of selfishness as the moving spring of human action; revealed the living God as the Father of mankind; and foretold the resurrection of the dead, to be followed by the judgment and by the award of eternal life and eternal death. At the beginning of his ministry the sermon on the mount was spoken, which has become the standard of morality throughout Christendom; and after the three years and a half which, so far as can be judged, was the duration of his public course, had witnessed his strenuous activity in instructing all classes of the people, in cities, villages, and desert places, the last day of his teaching seems to have surpassed any other, even of his life, in the number, variety, and greatness of its themes. Beginning early in the morning and continuing far on into the evening, he drew lessons from the blighted fig-tree; spake the parables of the two sons, the husbandmen, and the marriage of the king's son; answered the hypocritical question of the Pharisees and Herodians, the scoffing question of the Sadducees, the earnest question of the scribe, and added his own silencing counter-question concerning the Messiah; pronounced the terrible denunciations against the scribes and Pharisees, and the doom of Jerusalem; gave his estimate of the comparative value of offerings to the Lord; received the Greeks, who sought admission to him, as representatives of Gentile nations; foretold the destruction of the temple, the close of the Jewish dispensation, and the end of the world; spake the parables of the virgins and the talents; and closed all with the prediction that the remembrance of Mary's offering should accompany the preaching of the gospel throughout the whole world. A large part of the ministry of Jesus was around the sea of Galilee, the shores of which, as a microcosm, were crowded with people of many lands. This was the beginning and the emblem of the advancement which his teaching and his living power have since made. The chief work of his disciples was, for centuries, around the Mediterranean, then the center of empire and civilization. The third advance of Christianity was along the shores of the Atlantic, on which the nations of western Europe and their colonies were and are the most influential portion of the world. And now Christ's work is advancing also on both shores of the still wider Pacific. The sinless character of Jesus was manifested in a life which, while perfectly free from self-seeking, was actively exerted in beneficent work, was ennobled by love to those who hated him, and irradiated by filial obedience to God. His claim to be the anointed Son of God was advanced to his disciples, to Nicodemus, to the woman of Samaria, in gatherings of the people, among the chief priests and Pharisees, and, most solemnly of all, before the great council of the nation who, because of it, condemned him to death. And this claim was attested not only by his sinless life, his mingled meekness and majesty of manner, and his mighty works, but also by audible acknowledgments from heaven, at his baptism, at his transfiguration, and just before his crucifixion; and, most powerfully of all, by his resurrection from the dead and the consequent establishment and advancement of the world's faith in him from age to age. The crucifixion of Jesus is a part of Jewish history, and is as certain as any other event in that; it is a part of Roman history, and is as certain as any other event in that; it is as certain as that the history of the Jews was crossed by that of the Romans. And the fact of his crucifixion being sure, all Scripture teaching concerning him is established; for the Scriptures written before it led to it; and those written after it were its results, followed, as it was, by his resurrection on the third day. "It marks also the boundary between ancient and modern days. From the hour when Christ died began the death-knell to every Satanic tyranny and every tolerated abomination; and from that hour holiness became the ideal of all who would name him as their Lord."

JESUS COLLEGE, Cambridge, was founded by John Alcock, bishop of Ely, in 1496, to whom the king granted for the purpose the nunnery of St. Radegund, which was suppressed for the dissolute conduct of its inmates. The appointment of the master rests with the bishop of Ely. There are sixteen foundations, and three by-fellowships, and numerous scholarships. Among the distinguished members of this college are to be noted Richard Fox, bishop of Winchester in the reign of Henry VII.; archbishop Cranmer; and Fisher, bishop of Rochester in the reign of Henry VIII..

JESUS, SOCIETY OF THE SACRED HEART OF, is virtually the society of Jesuits under another name. At the close of the 18th c. the Jesuits, in view of the suppression of their order, established other orders which would continue their peculiar work under a new name and form. The principal of these were the society of the Sacred Heart of Jesus established in Belgium in 1794, by the ex-Jesuits De Broglie, Pey, and Tournély, and the Baccanarists or *Fathers of the Faith of Jesus*, established in Italy in 1798 by Baccanari, a layman of Trent, aided by several ex-Jesuits. In accordance with the desire of pope Pius VII., these two societies united in 1799, and made considerable progress in Italy, France, Germany, and England.

An order of women by the same name and with similar aims was founded in 1800 at Paris, and approved in 1826 by Leo XII. Its first leader was the maiden, Barat. Engaging zealously in the education of young women, they are regarded with favor, and flourish, not only in Roman Catholic but Protestant countries. They have more than 100 establishments in Europe, and exist also in America and Africa.

JESUS, SOCIETY OF. See JESUITS.

JESUS, SON OF SIRACH. See ECCLESIASTICUS.

JET, a bituminous mineral of a perfectly black color, not harder than ordinary coal, but capable of being easily cut and carved, and of receiving a very beautiful polish. It takes its name from the river of Lycia, from the banks of which it was obtained. In the time of Pliny, the name of the river and a small town on its bank was Gages, and the pieces of jet obtained from thence were called gagates, afterwards successively corrupted into gagat and jet. It is now found in many parts of the world. In Great Britain it is obtained chiefly at Whitby, in Yorkshire, where it is found mixed with fragments of bituminized wood of coniferous trees in the upper lias or alum shale of that district. Jet is only a peculiar form of pitch-coal, containing about 37½ per cent of volatile matter, like the albertite of New Brunswick and some of the cannel coals. It is electrical when rubbed, hence it has been called black amber by the Prussian amber-diggers, when it occurs in sand and gravel beds.

Very large quantities are obtained in France in the department of Aude, where it gives employment to numerous artisans, who form it into rosary beads, crosses, and other trinkets, which are extensively sold in Roman Catholic countries. Spain also supplies fine jet, which, like that of the French workings, is found in irregular veins in the lower marls of the cretaceous series, corresponding with the Sussex gault. The Spanish jet is found at Villaviciosa, in the province of the Asturias, and is principally manufactured at Oviedo. As a material for mourning ornaments, jet is admirably adapted, and for that purpose is used largely in this and other countries.

JETER, JEREMIAH BELL, D.D., 1802-79; entered the Baptist ministry in 1822 in Virginia, and, except during a brief period about 1849, when he was settled in St. Louis, Mo., continued to preach in that state, as pastor of a church in Richmond. He was a writer of ability, was senior editor of the *Religious Herald*, published in Richmond, and the author of a number of works, including *Campbellism Examined*; *Memoir of Rev. M. W. Clifton*; *Life of Mrs. Henrietta Shuck*; etc.

JETSAM means goods cast into the sea which sink and remain under water. They belong to the crown until the owner appears and claims them. See FLOTSAM. The subject is now chiefly important from its effects on the owners, and is treated under the head of jettison (q.v.).

JETTISON is, in the law of the United Kingdom, the throwing overboard of a ship's cargo, either in whole or in part, in cases of necessity, so as to lighten the vessel in a storm, or to prevent capture, or for other justifiable cause. It is obvious that great discretion is required, so as to judge when the proper time arrives for resorting to this desperate expedient; and in case of part only of the cargo being sacrificed, to select which part. Each case must depend upon its own circumstances; and the master of the vessel is the authorized agent, so as to bind all parties in such a situation. It often happens that the goods belong to different owners, and therefore, in order to compensate the owner of the particular goods thrown overboard, the doctrine of general average is resorted to. See AVERAGE. In case of a storm, the several persons interested in the ship, freight, and cargo in general contribute ratably to the loss; but there are exceptions when the goods were carried on deck. When the goods sacrificed by jettison have been insured, the insurer has the benefit of this contribution or average *pro tanto*.

JETTY, an embankment or pier extending into the sea, and built of earth, stone, fascines, timber, or other suitable material, either singly or combined. Jetties are applied to rivers and tidal harbors, to increase the depth over bars by narrowing the channel, and thus concentrating the current. Jetties have been constructed at the mouths of many European rivers, as the Oder and Danube, and the entrances of many harbors, as Boulogne, Dunkirk, and Calais. The Danube jetties increased the depth from 9 to 20 ft. and transformed it into one of the best harbors on the Black sea. The great erosive power of water causes rivers to transport vast quantities of sediment, which are deposited at the mouths, forming the delta. Capt. Eads says that the suspended matter carried by streams depends upon the rapidity of the current, modified by the depth; and that the relation between the amount of sediment transported and the velocity is very sensitive, a decrease in velocity causing a deposition of suspended matter. Bearing in mind that, other things equal, the velocity increases as the area of the river-section diminishes, the problem is to construct barriers which shall decrease the area. The hydraulic engineer bases his plans upon a careful survey of the delta, and upon a knowledge of the amount of water discharged by the river in a unit of time, and the variations of water-line at different seasons, the areas of sections, the location of bars, the direction of prevailing winds, the effect of storms, etc. The bars existing at the mouth of the Mississippi river have been a serious impediment to commerce; various plans have been suggested for the maintenance of a channel. Dredging proved ineffectual. This river and its affluents drain an area of nearly 1,250,000 sq.m.; the yearly rainfall of the basin is 30.4 in.; and the average discharge, 21,300,000,000 cubic ft. of water per year, or 675,000 cubic ft. per second. Capt. James B. Eads first proposed the application of jetties to the Mississippi river, presented the scheme to congress, and March 3, 1875, was author-

ized to undertake the work at the risk of himself and associates. In the face of much opposition he brought the energy of the river to bear upon the great bar of sand and silt separating South pass from the deep water of the gulf of Mexico, thus increasing the depth from $7\frac{1}{2}$ to 30 ft. and achieving a complete success. The merchants of New Orleans have arranged for a visit to their port by the Great Eastern, and direct exportation from the river-basin has been stimulated. Acts of congress awarded Capt. Eads for the expense of the work, \$4,250,000—payable in installments as different depths and widths of channel should be obtained; \$1,000,000 for his services, to be paid when it is known that the jetty works duly maintain the channel; and \$100,000 yearly for 20 years, to repair the works and preserve the depth. The depth between jetties required by contract is 30 ft.; width of channel, 350 ft.

Description of the Mississippi Jetties.—The river divides into three principal mouths or passes; the jetties are at the entrance to the middle or South pass. The east jetty extends from Eastside Landsend, at or near East point signal, along the edge of the old bar and into the gulf, a distance of 11,800 ft.; its course is a broken and a curved line deflecting at the gulf end 1700 or 1800 ft. to the right of the first alignment on the shore end prolonged. The west jetty is 1000 ft. w. of the east jetty, parallel to it, and, starting opposite a point 4,000 ft. from the head of the east jetty, extends 7,800 feet. The Kipp dam, 600 ft. long and perpendicular to the west jetty at its head, joins it with the west shore; its construction is like that of the jetties. The jetty lines were established by driving piles; permanent cross sections were made 500 ft. apart by locating sighting points on and behind each jetty in the sections and in diagonal sections; and periodical soundings were made which furnished data for the construction of profiles showing the changes in the channel. The chief constructive materials used in the jetties are willow mattresses, stone, palmetto cribs, and blocks of concrete. The boughs are brought from a crevasse 23 m. above the jetties, where there is a heavy growth of willows; they are obtained with difficulty, as the mud is covered, in the flood season, with a foot of water. The mattresses are constructed upon inclined planes, having a rise of 1 in 10; the lower end rests in the water, while the upper is 6 ft. above. The mattresses vary in width from 20 to 40 ft. or over; they are generally 100×40 feet. Longitudinal strips, $2\frac{1}{2} \times 6$ in., are first laid on the ways, $4\frac{1}{2}$ ft. apart; across these a layer of willow boughs, 6 in. thick, is placed, with the switch ends extending 2 or 3 ft. beyond the outside strips; a second layer, at right angles to the first, is placed next above; and so on, till the required thickness, generally 2 ft., is attained. Finally, transverse strips are fastened to the bottom strips with hickory pins. The mattress is then launched, and towed to its destination, where it is tied to the piles, loaded with stone, and sunk to its position on the river bed or upon other mattresses. The bottom row of mattresses was sunk throughout the entire length of the jetties before beginning the second layer. The placing of a single mattress was always accompanied by a deepening of the channel somewhere, and, what was still more remarkable, a deposit of sand abutting against the mattress began at once on the sea side. In this manner the jetties have been greatly strengthened, while w. of the west jetty hard fine sand has been deposited, extending from the jetty to outlying reefs and shoals, and reducing the depth at high water from 9 ft. to a few inches. Capt. Eads and assistants, guided by experience, have modified their plans. A section of the finished jetty, as originally built, discloses a pile at one side; a number of mattresses, separated by layers of stone, and diminishing in width from the bottom to tide level, abut against the pile, while, upon the river side, the steps formed by the mattresses are covered with stone forming a slope. After the action of the water had produced a slope in the river-bed conforming to the new cross-section, another mattress was sunk on the slope adjoining the foundation-mattress and also covered with stone. The surface of the jetty above sea-level was covered with stone, and crowned with dimension-stone laid dry.

The flow of water between the jetties has been increased by temporary constructions, such as sheet piling and wooden aprons; a dam turns the water from Grand bayou into the pass; and dikes at the head of the pass still farther increase the flow. Max E. Schmidt, C.E., one of the assistant engineers, says: "There were three destructive elements to be overcome by these works: 1. The abrading power of the river current; 2. The momentum and impact of the waves; 3. The undermining power of the waves. With a full appreciation of the magnitude of these forces, no design was made, nor was any detail allowed to be put into the works, which did not strictly adhere to the following practical laws: 1. That a broad and elastic foundation will prevent undermining; 2. that proper slopes will resist impact of the waves; 3. That tight work will stop leakage; and 4. That work maintained at a uniform height will obstruct the escape of water by overflow." Noting in their order how far these laws have been fulfilled, we see, 1. That the two rows of mattresses, which have sunk into the bottom till a firmer strata was reached, afford a secure foundation; 2. Where the jetties pierce the bar, deposits on the sea side give ample protection, while, on the river side, wing dams—projecting perpendicularly 150 ft. from the jetties—stopped the current and caused sediments to be deposited, producing a gentler and more resisting slope, with a simultaneous deepening of channel: at the gulf ends of the jetties and extending some distance towards shore, the slopes have been improved by sinking cribs of palmetto wood at both sides of the mattresses, and then building up the desired slope with stones. 3. The compression of the mattresses by the weight of stone and the infiltration of sand has done much to dimin-

ish the leakage, but more time is needed to completely fill interstices, and the use of gravel and broken stone near the jetty top will greatly assist. 4. The shore jetty sections are now maintained above high-water mark without difficulty. Upon the summit of the gulf sections a continuous embankment of concrete, varying in dimensions, but usually 12 ft. wide and $3\frac{1}{2}$ ft. thick, has been constructed for a distance of 3,800 ft. upon the east jetty, and 2,800 ft. upon the west jetty. The concrete was molded in blocks weighing from 25 to 72 tons, and these were cemented together afterwards, forming one solid stone of great resisting power on each jetty, and aiding in the diminution of leakage by compressing the mattresses; it is hoped that the weight will cause the elastic limit of the willows to be reached, thus increasing its impermeability. A massive parapet is to surmount the concrete, the time of construction at any point depending upon the subsidence of the jetties. July 10, 1879, capt. Eads reported the completion of the jetty work; depth through the jetties over 30 ft.; at the head of the pass, 26 ft.—measurements being taken with the river at its lowest stage. The improvement of harbors by jetties depends upon the general principles cited as applicable in the great works at the mouth of the Mississippi; and many harbors on the great lakes and elsewhere in the United States have been thus made more accessible.

JEVONS, WILLIAM STANLEY, b. England, 1835; grandson of William Roscoe, the eminent historian, educated at University college, London, and made a fellow of his college in 1862. He held a position in the Sydney (Australia) mint, 1854–59. In 1866 he received the appointment of professor of logic and mental and moral philosophy, and Cobden lecturer in political economy in Owen's college, Manchester; in 1872 was elected a fellow of the royal society; and in 1876 received the honorary degree of LL.D. from the university of Edinburgh. During the latter year he was appointed professor of political economy in University college, London. He has written *The Principles of Science—a Treatise on Logic and Scientific Method; Theory of Political Economy; and Money, and the Mechanism of Exchange*.

JEW, WANDERING. See **WANDERING JEW**.

JEWEL (Ital. *gioiello*, from *gioia*, joy), a personal ornament, usually understood to mean a decoration in which one or more precious stones are set. Popularly, there is much confusion between the terms gem and jewel; the former belongs especially to precious stones, and the latter to ornaments formed of the precious metals with or without the aid of gems. The word is derived from the Italian *gioia*, joy, whence *gioiello*, a jewel, such ornaments being indicative of pleasure.

JEWEL or **JEWELL, JOHN**, D.D., 1522–71; an English clergyman, largely concerned in the religious troubles of the reigns of Mary and Elizabeth. At the accession of the latter queen he assisted in the re-establishment of the Protestant religion, was made bishop of Salisbury, and was an eloquent preacher. He published many controversial works, and his famous *Apologia Ecclesiae Anglicanae* was by Elizabeth's orders placed in every church in the country, and has ever since been looked upon as a classic of the Anglican communion.

JEWELL, a co. in n. Kansas, on the border line of Nebraska; 900 sq.m.; pop. 207. The surface is rolling prairie-land, with fertile soil, affording good pasturage. It is watered by branches of the Republican and Solomon rivers. Co. seat, Jewell City.

JEWELL, MARSHALL, b. N. H., Oct. 20, 1825. He was bred to the tanning business, but left it to engage in telegraph construction in the south-western states. In 1850 he established himself in business in Hartford, Conn., as a manufacturer of leather belting, and was very successful. His ability, public spirit, and warm interest in public affairs, gave him prominence as a private citizen; and his hearty support of the general government during the war of the rebellion drew special regard to him as a man qualified by his energy, integrity, and patriotism for the public service. He was elected governor of Connecticut in 1869, 1871, and 1872. In 1873 he was appointed minister to Russia, where he is said to have made himself master of the secret of making Russian leather. He returned to the United States in 1874 to enter the cabinet of gen. Grant as postmaster-general. In consequence of a misunderstanding with the president he resigned before the expiration of the latter's second term, returning to his home in Hartford. In 1880 he was chosen chairman of the national committee of the republican party, in which capacity it became his duty to direct and supervise the campaign for the choice of a president of the United States—a task which he fulfilled with great energy and success.

JEW'ELRY. The manufacture of jewels has in all times been a test of the artistic powers of a nation; for, being intended only for personal adornment, the genius of the jeweler has been directed to the production of the largest amount of beauty in the most limited space. It is probable that the wearing of ornaments of gold and silver is almost as early as the discovery of those metals. A mere hole drilled through the small pieces of gold or silver, to enable them to be strung round the waist or neck, would be the first stage; then, when the ductility of the metals became known, they would be beaten probably into bands or rings, giving rise to ring-money; these rings, when increased in size, would become torques for the waist, neck, arms, or ankles, labrets for the lips, and rings for the ears and fingers. As refinement increased, these articles would be made more and more ornamental; and the original object, of mere convenience and safety in

carrying the much-valued metals, would be lost in the secondary one of personal adornment; the art of the goldsmith would be called into play, and the taste of the nation would be marked by the good or bad designs in demand for this purpose. Jewels being mere articles of luxury and taste, their possession always indicates to a certain extent the wealth of nations, and we are as much impressed with the advanced state of the ancient Egyptians by the nice art and refined taste exhibited in the jewelry found in their tombs, as by the vast architectural works of which they have left so many remains; indeed, modern art, with all its wondrous advances, cannot do more than equal the exquisite workmanship of those elegant golden jewels sent by the late viceroy of Egypt and M. Mariette to the international exhibition, which were taken from the tombs of ladies of distinction, whose mummies they were found decorating. There is an essential difference between the jewelry of ancient and modern times. Our goldsmiths depend very much upon the processes of casting, drawing, stamping, and other metallurgical operations, and produce thereby great accuracy of outline and high finish. The ancients wrought by hammering, chasing, and *repoussé*, depending entirely upon the taste and skill of the artist, instead of the perfection of his tools and mechanical arrangements; consequently, their works bear the stamp of artistic productions, whilst modern works, however beautiful, have usually the character of mere manufactures executed with mechanical precision rather than artistic taste; and what they gain in nicety of finish is more than counterbalanced by what is lost in richness of effect. See DIAMOND.

JEWELRY (*ante*), MANUFACTURE OF, in the United States. The wearing of jewelry was earnestly discountenanced in the New England colonies as a practice savoring of worldly pride and ostentation, and therefore hardly compatible with piety. This form of asceticism, though it had its root in religious feeling, was no doubt stimulated by the poverty of the times. Gold beads appear to have been exempt from the prevalent proscription, being cherished as heirlooms, and transmitted with pride from mother and daughter; and as the colonies became prosperous, it became more usual for the fortunate possessors of gold coins to hand them over to the goldsmith to be cast into rings or chains. In the colonies s. of New England the religious objection to wearing jewelry was not so much felt, but the demand for it was limited, and most of that which was worn was imported. The jewelers of the period sometimes made plain rings and chains, but the manufacture of jewelry as a business was unknown in this country until some time after the war of independence. It is believed to have been first introduced in Newark, N. J., somewhere between 1790 and 1795, by Epaphras Hinsdale, who died in 1810, and was succeeded by Mr. Taylor, one of his workmen, who greatly enlarged the business and invented new machines for the prosecution of the work. Somewhere about 1800 the business was introduced in Providence, R. I., and was rapidly extended there. Mr. Hinsdale and Mr. Taylor had made all their articles of solid gold, but the Providence manufacturers soon began to make what is known as "filled work," the face of the jewel being stamped out from a thin ribbon of gold, and the shell filled with a solder of some baser metal, and then covered on the back with a thin layer of gold of an inferior quality. Of course this sort of work, which was scarcely distinguishable by an untrained eye, could be sold for much less than work of solid gold, and therefore it found a ready market. In 1812 Mr. George F. Downing began to manufacture various articles of jewelry in Newark, and in 1821 he removed to New York, where the manufacture of filigree jewelry had been introduced in 1812 by a Frenchman named La Guerre. From this time onward the business rapidly increased, until it met a check in the financial revulsion of 1837. With the return of national prosperity it revived, and was immensely increased by the discovery of gold in California. It met with another check in the disasters of 1857, and had hardly recovered when the war of the rebellion gave it another blow; but it was revived and immensely expanded when the country was flooded with paper money, and fortunes began to be amassed suddenly. Diamonds, which before that time had been rarely worn, were now in great demand, and the setting of them, previously confined to Europe, became a recognized branch of the jewelry manufacture in the United States. Imitation jewelry was also extensively manufactured to meet the wants of the poorer classes, who were infected by the fashion of the time. The trade in this spurious stuff was immense, yielding an aggregate profit of millions of dollars to those engaged in it. The annual production of jewelry in this country in 1850 was estimated at a little less than \$2,000,000. In 1860 the number of establishments had increased to 463, employing a capital of more than \$5,000,000, giving employment to about 6,000 persons, paying wages to the amount of \$2,600,000, and producing annually goods valued at about \$10,500,000. The productions of hair jewelry was a separate branch of business, and the goods annually produced amounted to somewhat less than \$15,000. Lapidaries' work, which was carried on in 7 establishments, was valued at about \$37,006 yearly. In 1870 the number of establishments was 681, employing over 10,000 persons, using capital amounting to about \$12,000,000, paying wages to the amount of nearly \$4,500,000, and producing goods valued at over \$92,000,000. The great centers of jewelry manufacture are New York, which in 1870 had 198 establishments, and produced goods valued at \$9,595,700; Providence, with 74 establishments, and products valued at \$3,086,846; Philadelphia, 53 establishments, \$1,583,741; Boston, \$338,000; Springfield, Mass., \$370,000; Cincinnati, \$338,000; San Francisco, 18 estab-

lishments, \$475,562; Bristol co., Mass., 33 establishments, \$1,510,925. The financial revulsion of 1873 depressed the business greatly, but it is now again becoming prosperous.

JEWELS, USE OF, IN HERALDRY. By an egregiously absurd and unnecessary complication of nomenclature, introduced by way of adding dignity to the science of heraldry, the tinctures of the arms of peers have sometimes been designated by the names of precious stones: argent is pearl or crystal; or, topaz; gules, ruby; azure, sapphire; sable, diamond; vert, emerald; and purpure, amethyst.

JEWETT, CHARLES COFFIN, 1816-68; educated at Brown university and Andover theological seminary. Acted as librarian at Andover, and made a catalogue of Brown university library, of which institution he was also librarian and professor of modern languages, 1843-48. He was afterwards librarian of the Smithsonian institution, and from 1858-68 superintendent of the Boston public library. Mr. Jewett was the first of the modern school of American librarians, and his *Notices of Public Libraries in the United States of America*, 1851, and suggestions of a new method of cataloguing libraries, have been of great service. He was one of the earliest, if not the first in this country, to adopt the card-cataloguing system to public libraries.

JEWETT, MILO PARKER, LL.D., b. Vt., 1808; educated at Dartmouth and Andover, and occupied a chair in Marietta college, Ohio, for three years from 1835. Having been a Presbyterian, he changed to the Baptist church, and in 1861, on the foundation of Vassar college for women, he was made its first president, a position which he resigned in 1876. He was among the first to introduce the common-school system into Ohio and Alabama. He wrote *The Mode and Subjects of Baptism*, which passed through many editions.

JEW-FISH, a common name of several species of the *serranidae*, which sometimes attain a weight of several hundred pounds. A species caught along the Florida coast, called the *promicrops gnasa*, sometimes weighs as much as 700 lbs. The jew-fish of California is the *stereolepis gigas*.

JEWISH LITURGY. See LITURGY.

JEWISH SECTS, a term generally applied (after Josephus) to certain divergent schools which grew up in the midst of Judaism, subsequently to the Syrian wars. So far, however, from forming, as the word would seem to imply, separate communities with places of worship and a religious law of their own, antagonistic to that of their brethren, the disciples of the different "sects" belonged to the same religious community, adhered to the same practical religious law, and consequently could not well look upon each other as, in a manner, heretics. The chief points at issue were certain abstract doctrines, in connection with the peculiar manner in which this law, as far as it is contained in the Scriptures, was interpreted and further developed. While the *Pharisees* (q.v.) claimed for certain time-hallowed observances and doctrines not found in the Bible a divine origin, drawing them back through tradition—orally transmitted from generation to generation—to Moses and the Sinai itself, and while they, by peculiar rules of an exegesis of their own, proved these same doctrines to lie often latent, as it were, in the very letters of the Bible—the *Sadducees* (q.v.) rejected the divine origin of the "oral law," as well as certain spiritual dogmas not distinctly set forth in the sacred record. An advanced or exalted class of Pharisees were the *Essenes* (q.v.), who formed a kind of brotherhood, far away (with only solitary exceptions) from the corruption of cities, chiefly intent upon the exercise of practical virtues, and ruled by a severe code of morals. The tenets of each of these three "sects" will be found treated separately under the headings indicated.

At a later period, shortly before and after Christ, numerous divergent religious doctrines, for the most part the result of a confused mixture of Judaism and Hellenism, or rather Alexandrianism (see GNOSTICS), were promulgated, and found adherents both within and without the pale of Judaism. Many and obscure are the names of these "sects" recorded by the early fathers of the church, but very little is known respecting their history and dogmas. Mention is made of *Hellenians* (Hillelites?), not to be confounded with the large body of the *Hellenists* (q.v.) and *Meristes* (antagonistic school of Shamai?), *Galileans* (Christianizing Jews?), *Herodians* (adherents of the foreign government?), *Gaulanites* (Rabbinists of exaggerated tendencies?), *Masbotheans* (strict Sabbatharians?), *Hemerobaptists* (Essenes?), etc.

In the 8th Christian c. (761 according to Munk), the Sadducean doctrine of the invalidity of the "oral law"—a doctrine which had died out after a brief existence—was revived again by Anan ben David, who is supposed to have held a high spiritual office (Resh Gelutha? Gaon?) at Bagdad at the time of caliph Abu Giafar Al-Mansor (754-775 A.D.), and who, rejecting the Talmud and Midrash as the work of man, only allowed such laws and ordinances to be binding upon the community which resulted immediately from a simple and natural Scriptural exegesis. He thus became the founder of the most important sect of the *Karaite*s, who, within an astonishingly brief period, spread over Palestine, Egypt, Greece, Barbary, Spain, Syria, Tartary, Byzantium, Fez, Morocco, and even to the ranges of the Atlas. They are now, however, found only in small numbers in Poland, Galicia, Odessa, the Crimea, Constantinople,

Jerusalem, and Alexandria. Abrogating the "rabbinical" traditions, they erected a new traditional system of their own, to be altered and freely developed by each of their successive spiritual heads. Prayer, fasting, pilgrimages to Hebron, are the points of religious practice to which they pay the greatest attention. Their general conduct is even by their antagonists allowed to be of the highest moral standard. They have produced an extensive special Hebrew literature of their own, chiefly consisting of works on theology, philosophy, mathematics, astronomy, etc. The greatest number of these is now found in the imperial library at St. Petersburg. Some of their principal authors are Anan, Shalmon b. Jeruham, Joseph b. Noah, Jeshua, Jehudah Hadassi, Aron b. Joseph, Aron b. Eliah, Eliah Beshitzi, Kaleb, Moses Beshizi, Mardochai b. Nissan, etc.

Another rather curious sect, known as the *Shebsen*, was that founded by Sabbathai Levi from Smyrna (1625-77), who proclaimed himself the Messiah, and found numerous followers throughout Germany, Poland, Italy, and Holland. Sultan Mohammed IV., however, put an end to his mission by imprisoning him, and making him adopt Mohammedanism. Many of his disciples followed his example, others turned Roman Catholics—adhering, withal, to their former doctrines and tenets, consisting chiefly of the belief in the Messiahship of their master, a distinct leaning to the dogma of the Trinity, and the abandonment of the hope of a final return to Jerusalem under the guidance of "Messiah ben David." They put a thoroughly mystical interpretation upon the Bible, rejected unconditionally the Talmud, and extolled their special Kabbalistic gospel, the Zohar, above all things created. This sect did not die out until the end of the last century, Jakob Frank, their last supreme pontiff (whose more intimate friends and followers called themselves by his name, *Frankists*), dying in a debtor's prison on the Rhine (1791).

We have finally to mention the modern *Chasidim*—not to be confounded with the ancient Chasidim (q.v.)—or *Beshters* (Baal Shem Tob), a side branch of the former sect, taking its stand like this on the Kabbala, but remaining ostensibly within the province of rabbinical Judaism. They are chiefly remarkable by their wild mode of praying, their supreme contempt for any but mystical and religious science, by their belief in the miracles wrought by their temporary chiefs or saints (*Zaddik Baal Shem*), who rule their community unconditionally, are supposed to be invested with divine powers, and who also cure all their bodily ailments. The grandeur and pomp with which these are surrounded, contrasts most strikingly with the simple mode of life of their flock. Constant repentance, joyfulness, disinterestedness, benevolence, peacefulness, with intrepidity, cleanliness, and temperance, are some of the chief points of the practical doctrine of this sect. One of the great reproaches, however, brought against them is, that their "joyfulness" often leads them into transgression; that, in fact, they are rather given to sensuality. They are very numerous in Poland, Galicia, Russia, and Palestine.

The modern "Reformers," aiming chiefly at a simplification of the ceremonial, and abrogation of what they consider to be abuses and late additions in the divine worship, cannot well be called a sect—although, for the most part, they have synagogues and prayer-books of their own—since they belong, to all other intents and purposes, to the great body of the Jewish community. As the chief promoters of this movement may be considered Zunz, Geiger, Chorin, Creizenach, Holdheim, Hess, Stern, etc.

JEWS (corrupted from *Yehudim*), the name given since the Babylonish captivity to the descendants of the patriarch Abraham, who, about 2,000 years b.c., emigrated from Mesopotamia, on the e. side of the Euphrates, to Canaan or Palestine. They were originally called Hebrews (q.v.). Monotheism, or a belief in one God, the practice of circumcision, and the expectation of ultimately possessing the land in which they then sojourned, were the three distinguishing peculiarities transmitted by Abraham to Isaac, and from Isaac to Jacob and his descendants. The picture of patriarchal life presented to us in the book of Genesis is marked by an exquisite beauty and simplicity, and bears traces of a great antiquity. In consequence of a famine in Canaan, Jacob, on the invitation of his son Joseph, who had become chief minister of the king of Egypt, went down thither with all his family, which numbered 70 "souls," and obtained from Pharaoh permission to settle in the land of Goshen. Here the Hebrews resided, according to Exod. xii. 40, 430 years [Bunsen (EXODUS) calculates fourteen centuries] according to the genealogical table of the Levites, in Exod. vi. 16-25, however, their sojourn would not have lasted longer than 210 or 215 years; most of the commentators, therefore, take, with Josephus, the 430 years to indicate the period from Abraham to the exodus (cf. Galat. iii. 17). During the lifetime of Joseph, and probably for some generations afterwards, they were well treated, and prospered; but a new dynasty, supposed by some—with little show of reason—to have been that of the Hykshos (q.v.), arose, and they were reduced to relentless slavery. A deliverer at length appeared in the person of Moses (q.v.), a man of grave and heroic character, who, though brought up by the daughter of Pharaoh as her son, and trained in all the learning of the Egyptians, was nevertheless filled with an intense and indignant patriotism, that acquired an additional elevation from the ardor of his religious feelings. The circumstances that preceded and characterized the exodus (about 1600 b.c.)—such as the 10 plagues and the crossing of the Red Sea—are a source of continual controversy between the rationalistic and the supranaturalistic schools of biblical criticism; but the fact of an exodus would be dis-

puted only by the wildest skepticism. The entire history of the people is pervaded by the memory of this grand event, upon which, as it were, their whole national existence is based; it inspires their poetry and consecrates their religion; and the passover, with all its ceremonials and mementoes, was instituted expressly to remind them of that wondrous night of sudden liberation; while the feast of tabernacles was to recall to the memory of the latest generations the wanderings through the desert; and pentecost, the act of the legislation on Sinai. Whether, however, in 215, or even in 450 years, the 70 "souls" could have increased to 600,000 adult men, or, including wives and children, to between 2,000,000 and 3,000,000 souls, is a point to be determined rather by physiologists than by theologians.

The wandering in the wilderness of the Sinaitic peninsula is said to have lasted 40 years, though a record of the events of two years only has been preserved. These, however, are obviously the most important, as they contain an elaborate account of the giving of the law (Exod. xix. *et seq.*), which is represented as a direct revelation made to Moses by Jehovah himself, who descended upon Mt. Sinai in fire, amid the roar of thunders and the quaking of hills. The antiquity, however, of the priestly or ecclesiastical portions of the Pentateuch is keenly disputed by many modern scholars of the highest reputation, who endeavor to show the probability of such passages having been composed and inserted subsequent to the great organization of the priesthood by David; and in proof of this, point, among other evidences, to the Book of Judges (q.v.), which narrates the history of the Hebrews for 300 years *after* the conquest of Canaan, and which yet contains scarcely a single trace of the existence of a religious institution among them. Yet it is allowed almost on all hands that the *foundations*, at least, of the Jewish theocracy, and probably also a large part of the superstructure, were the direct work of Moses himself, who indeed appears to have been pre-eminently fitted for the task of a legislator, not to mention the fact that the ritualism of the Hebrews has many striking points of contact with that of the ancient Egyptians, with which he was well acquainted. This view, of course, does not interfere with the theory of a later composition of the Pentateuch (q.v.), in its present shape and its successive redactions and enlargements. But whatever period be allowed for the sojourn in the desert, the rough, nomadic life, the frequent fighting with the fierce Bedouin tribes, through whose territory they passed—besides the lofty influences of a stern religion—had transformed the runaway slaves of Egypt, by the time they approached the eastern borders of Canaan, into a nation of high-spirited and irresistible warriors.

Before proceeding further, it behooves us to trace a general outline of the Mosaic legislation. The laws promulgated under the "Covenant" were, as we said, not entirely new. Many were merely the solemn confirmation of ancient patriarchal tenets, such as the worship of one supreme being through sacrifices, prayer, vows, circumcision, the government by heads of tribes and families, etc. Others must have been adaptations of Egyptian institutions. Others, again, owed their existence to the altered circumstances of the community; and it is undeniable that some of the ordinances contained in the Pentateuch were never carried into practice. The fundamental features of the religion as well as political constitution—both closely interwoven with each other—are the following: God is Creator and Lord of the universe. The universe is his own, and to man the use of all created things has been intrusted by his will. God is therefore the king of the people. By the priests he is visibly represented. No man has the right to dispose of his own liberty. The soil is only given to the people for the *usufruct*; man has no further individual right of possession over it. Every seventh year it is to be left to itself. The sale of land is prohibited; and after seven times seven years, every lease and mortgage of it is null and void, and it is to return to the heirs of those to whom it was originally assigned at the first division of the land.

The office of the priests (q.v.) was in the hands of the tribe of Levi (q.v.), more especially the descendants of Aaron (q.v.). The Levites assisted in the management of the sanctuary and the holy rites, copied and expounded the books of the law, kept the genealogical lists, and had the care of the general instruction of the people. Together with the priests, they had administrative and judicial functions, and they gave their judgment always in the name of God. The high priest (q.v.) constituted the highest court, and his was the oracle (*Urim and Thummim*). Periodical feasts (q.v.) were instituted, in order that the dependence from the divine King should always be kept in view by the people. Every seventh day the body should rest from labor (*Sabbath*), as every seventh year the soil was to rest (*Sabbatical year*); and every fiftieth (7×7) year (*Jobel*) was the great year of remission. Three annual feasts, partly of an agricultural, partly of a historical character, were the *passah* (q.v.), the *feast of weeks* (q.v.), and the *feast of tabernacles* (q.v.). No less was the first of the seventh month to be kept holy. The tenth of the same month was instituted a day of atonement and forgiveness of sin.

The form of government was at first a theocratical one. The people was divided into 12 tribes, which formed small republics, but were all united under the invisible rule of Jehovah. General national assemblies decided upon war and peace, and the like. Special provisions are also found for the contingency of the election of a king. After the conquest of Palestine, every city had a judge, chosen by the heads of the families and tribes. The punishments were either death, flagellation, or fines. Three Levitical cities were

named by Moses as asylums or places of refuge for man-slayers whose guilt was not yet fully established. Every free citizen was bound, from his 20th year, to military service in case of war. To the besieged city, terms of capitulation were first to be offered; were these rejected, the city was to be taken, and the males were to be put to the sword. In all other cases, the virtues of charity, justice, and kindness, even towards animals, are repeatedly impressed upon the people. How far these fundamental rules were either further developed or neglected, we cannot show in this place.

The "land of promise" became theirs at last (about 1430 B.C.), under Joshua (q.v.), the successor of Moses. Tribe after tribe was swept from its ancient territory, and for the most part either annihilated or forced to flee. Yet the whole bulk of the native inhabitants was not extirpated or wholly expelled, nor even subdued, till a much later period; a circumstance fraught indeed with the most disastrous consequences to the new commonwealth. The country was now divided among the tribes. The magnificent pastoral region to the e. of the Jordan had before been chosen by the tribes of Reuben, Gad, and the half-tribe of Manasseh at an early period, because they "had a very great multitude of cattle" (Numb. xxxii. 1); but they now for the first time entered on possession of it. The land w. of the Jordan was parceled out to the remaining—Judah, Simeon, Dan, Benjamin, Ephraim, the second half-tribe of Manasseh, Issachar, Zebulon, Naphtali, and Asher. The tribe of Levi received, instead of a province, 48 cities scattered throughout Canaan and the tenth part of the fruits of the field, and were allowed generally to settle individually throughout the land where they chose (LEVITES, PRIESTS, HIGH PRIESTS).

After the death of Joshua (about 1350 B.C.), the want of a chief to the young state became sadly palpable. Little regard was paid to the "Mosaic" institutions; the single tribes pursued their own individual interests; intermarriages with the idolatrous natives weakened the bond of union still further; and the next consequence was that the tribes were singly subdued by the surrounding nations. At this juncture there arose at intervals valiant men and women—shofetim—judges, who liberated the people from their oppressors, the Moabites, Philistines, Ammonites, Amalekites, etc. Fifteen of those are named, some of whom appear to have been contemporary with each other, and to have exercised authority in different parts of the country. This period constitutes the "heroic" age of Hebrew history. Among these judges, the prophetess Deborah (q.v.), Gideon (q.v.), Jephthah (q.v.), the herculean Samson (q.v.), and the prophet Samuel (q.v.), are especially notable: the last mentioned was, in every sense of the word, the greatest Hebrew that had as yet appeared since the days of Moses. With him begins a new and higher stage in the development of the national character, chiefly through the instrumentality of the priestly order, whose spiritual, for the most part well-directed and humanizing, influence was by him first exalted and most distinctly brought to bear upon the commonwealth. Samuel, the first of the prophets, was also the last of the republican chiefs of the confederate tribes. Weary of their intestine feuds, harassed by the incursions of their predatory neighbors, chiefly, however, goaded by the characteristic desire "to be like all the other nations" (1 Sam. viii. 5), the people compelled him, when he had become "old and gray-headed" (1 Sam. xii. 2)—while the behavior of his sons, whom he had made judges, unfitted them to be his successors—to choose for them a king (1080 B.C.).

The first who exercised regal authority was Saul (q.v.), the Benjamite. But though a distinguished warrior and a man of royal presence, he appears not to have possessed the mind of a statesman; and his willfulness, and the paroxysms of insanity, brought on chiefly, as it would seem, by the openly-expressed dissatisfaction of Samuel, finally alienated from him many of the bravest and best of his subjects. After his death on Mt. Gilboa, David (q.v.), his son-in-law, was proclaimed king. This monarch was by far the greatest that ever sat on the throne of Israel. He ruled, as is commonly computed, 1058–1018 B.C. His reign, and that of his equally famous son, Solomon (q.v.), are regarded as the golden time of Hebrew history; the remaining aborigines of Canaan and its borders—viz., the Philistines, Edomites, Amalekites, Moabites, etc., were thoroughly subdued; the boundaries of the Hebrew kingdom were extended as far as the Euphrates and the Red sea; Jerusalem was captured by escalade, and made the capital of the conqueror; the priesthood was reorganized on a splendid scale; the arts of poetry, music, and architecture were cultivated; schools of prophecy (first established, probably, by Samuel) began to flourish; a magnificent temple for the worship of Jehovah was built in the capital; and commercial intercourse was carried on with Phenicia, Arabia, Egypt, with India and Ceylon, and perhaps with even Sumatra, Java, and the Spice islands. But there was a canker at the root of all this prosperity. The enormous and wasteful expenditure of Solomon forced him to lay heavy taxes on the people. His wealth did not enrich them; it rather made them poorer; and although gifted with transcendent wisdom and the most brilliant mental powers, towards the end of his life he presents the sad spectacle of a common eastern despot, voluptuous, idolatrous, occasionally even cruel, and his reign (1018–978 B.C.) cannot but be regarded, both politically and financially, as a splendid failure. After his death (978), the Hebrew monarchy, in which the germs of dissension—chiefly jealousy against the influence of Judah—had been silently growing up for many a year, split under Rehoboam into two sections (975 B.C.); the kingdom of Judah, under Rehoboam, son of Solomon; and the kingdom of Israel,

under Jeroboam the Ephraimite. The former of these countries comprised the two tribes of Judah and Benjamin, together, probably, with some Danite and Simeonite cities; the latter, the remaining 10. After 19 kings, of different dynasties, among whom Jeroboam, Ahab, Joram, Jeroboam II., Pekah may be mentioned, had reigned in Israel, few of whom succeeded to the throne otherwise than by the murder of their predecessors, the country was finally conquered by Salmanassar, king of Assyria; its sovereign, Hoshea, thrown into prison; the mass of the people carried away captive (720 b.c.) into the far east, the mountainous regions of Media, and their place supplied by Assyrian colonists, brought from Babylon, Persia, Shushan, Elam, and other places by Asnappar. These, mingling and intermarrying with the remnant of the Israelites, formed the mixed people called Samaritans (q.v.). Among the 20 kings of the house of David who ruled over Judah, Jelioshaphat, Uzziah, Hezekiah, and Josiah distinguished themselves both by their abilities as rulers, and by their zeal for the worship of Jehovah. Yet even they were, for the most part, unable to stay the idolatrous practices of the people, against which the prophets' voices even could not prevail. Other kings were, for the most part, more or less unfaithful themselves to the religion of their fathers and unable to withstand the power of the Egyptians, Assyrians, and Babylonians, to each of whom they in turn became tributary, until at last Nebuchadnezzar stormed Jerusalem (586 b.c.), plundered and burned the temple, put out the eyes of king Zedekiah, and carried off the most illustrious and wealthy of the inhabitants prisoners to Babylon. The Israelites, who had been exiled 134 years before the inhabitants of Judah, never returned. What became of them has always been, and we presume will always remain, matter of vaguest speculation. See BABYLONISH CAPTIVITY.

All that we know of the condition of the Hebrews during the captivity, relates exclusively to the inhabitants of the kingdom of Judah. And so mild, especially during the later years, was the treatment which they received in the Babylonian empire, that when liberty was announced to the whole body of the captives, only the lowest of the low returned, together with the Levites and priests (cf. Talm. Kidd. iv. 1). The book of Esther likewise bears testimony to the vast numbers that had remained scattered over the vast empire. See BABYLONISH CAPTIVITY.

The influence of this exile, however, was of a most striking and lasting nature. Babylon henceforth became and remained, up to about 1000 b.c., the "second land of Israel"—in many respects even more highly prized than Palestine. To this brief period of the captivity must be traced many of the most important institutions of the synagogue in its wider sense. Common religious meetings, with prayer, were established; many of the Mosaic laws were re-enforced in their primitive rigor; and the body of the "oral law" began to shape itself, however rudely, then and there. Besides, there began to grow up and unfold itself the belief in a Messiah, a deliverer, one who should redeem the people from their bondage. The writer of the last 27 chapters of Isaiah, who is usually called by modern scholars the "Younger Isaiah," is held to belong to this period, and expresses in glowing language the hopes of the exiles; no less do many of the psalms belong to this time. "From this period, likewise, the immortality of the soul and the belief in another life appear more distinctly in the popular creed, in which, if they had existed at all, they had been obscured by the more immediate hopes and apprehensions of temporal rewards and punishments revealed in the law. But in the writings of the Babylonian prophets, in the vision of dry bones by Ezekiel, and in the last chapter of Daniel these doctrines assume a more important place; and from the later books, which are usually called the Apocrypha, these opinions appear to have entered fully into the general belief. In other respects, particularly in their notions of angels, who now appear under particular names, and forming a sort of hierarchy, Jewish opinions acquired a new and peculiar coloring from their intercourse with the Babylonians" (dean Milman's *History of the Jews*, Lond. 1829, vol. ii. pp. 13, 14). Compare articles DEMONS and DEVIL.

The exile is generally computed to have lasted 70 years. This is not strictly correct; it lasted 70 years if reckoned from the appearance of Nebuchadnezzar in anterior Asia (606), but only 52, counting from the destruction of Jerusalem. When Cyrus, the Persian king, had overthrown the Babylonian kingdom (538 b.c.), the condition of the Hebrews improved considerably. The new monarch must have felt that he could rely on them, as being really strangers in the land, and necessarily more or less hostile to their conquerors, the Babylonians. Daniel rose higher and higher in dignity and power, and finally became "supreme head of the pashas to whom the provinces of the vast Persian empire were committed." Through his influence, Cyrus was prevailed upon to issue an edict permitting the exiles to return home. A minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah. Upwards of 40,000 persons, including 4 of the 24 courses of priests, set out under the leadership of Zerubbabel, a descendant of their old kings.

Notwithstanding the many and harassing obstacles raised by the Samaritans, the mixed people of Assyrians and Israelites, against whom the scrupulous exiles entertained strong religious and national objections, the rebuilding of the "temple of the Lord" was at last commenced in the first year of Darius, and in the sixth year of his reign it was finally completed. [HAGGAI; ZACHARIAH.] The waste cities were likewise rebuilt and repeopled. During the long reign of Darius the Jews were blessed

with a high degree of material prosperity. Under his successor, Xerxes, probably occurred the incidents recorded in the Book of Esther. In the seventh year of Artaxerxes, the successor of Xerxes, Ezra the priest, invested with high powers, and accompanied with a great retinue of his professional brethren, headed a second migration. Thirteen years later, during the reign of the same monarch, Nehemiah, his cup-bearer, but a man of Jewish family, was ordered to proceed to Jerusalem, and, aided by Ezra and others, succeeded in secretly fortifying the city, notwithstanding the continuous opposition from Samaritans, Ammonites, and Arabians. The strictest observance of the "written law," even of those of its parts which had been for some reason or other disregarded, was now rigorously enforced, and many "oral ordinances" were put into practice, which do not seem to have been much heard of previously. The supreme spiritual authority was vested in a society of pious and pre-eminently learned men, founded by Ezra, out of which grew the "great synagogue," of whose existence modern scholars no longer see any reason to doubt. The compilation and transcription of the sacred records began, periodical public readings and expoundings of the law were instituted, and the vast targumic, as well as the so-called rabbinical literature, generally dates—in its earliest beginnings—from this point. During the life of Nehemiah the breach between the Jews and Samaritans became final, by the erection on Mt. Gerizim (near Samaria) of a rival temple to that at Jerusalem, and the creation of a rival priesthood. For more than a hundred years the Jews lived quietly under the Persian yoke, too insignificant to excite any attention from the Greeks, then in the full meridian of their political and literary greatness; and scanty are the accounts which, as yet, have, out of the mazes of ancient Jewish literature, been brought to light, with respect to the inner intellectual life of the Jews during that period. That, although silent, it must have been extremely active and rich, is amply evidenced by the sudden appearance, immediately afterwards, of a vast number of literary productions.

Alexander the great, on his way to conquer the whole east, did not deem it necessary to storm Jerusalem. The inhabitants submitted, and he even deigned to have sacrifices offered on his behalf to the national god of his new subjects, a great number of whom, and of Samaritans, he carried away to Egypt (where Jews were supposed to have immigrated as early as the time of the last kings of Judah, and later under Artaxerxes Oclius), and peopled a third of his newly-founded city Alexandria with the Jewish captives. After him, Ptolemy the son of Lagos, surnamed *Soter*, one of Alexander's generals, who had become king of Egypt, invaded Syria, took Jerusalem (301 B.C.), and carried off 100,000 of its inhabitants, whom he forced to settle chiefly in Alexandria and Cyrene. The Egyptian (Alexandrian) "dispersion" (*Golah*)—destined to be of vastest importance in the development of Judaism and Christianity—gradually spread over the whole country, from the Libyan desert in the n., to the boundaries of Ethiopia in the s., over the Cyrenaica and part of Libya, and along the borders of the African coasts to the Mediterranean. They enjoyed equal rights with their fellow-subjects, both Egyptian and Greek, and were admitted to the highest dignities and offices: so that many further immigrants followed of their own free-will. The free development which was allowed them enabled them to reach, under Greek auspices, the highest eminence in science and art. In Greek strategy and Greek statesmanship, Greek learning and Greek refinement, they were ready and brilliant disciples; even their artisans and workmen were sent for by distant countries. From the number of Judeo-Greek fragments, historical, didactic, epic, etc. (by Demetrios, Malchos, Eupolemos, Artapan, Aristaeos, Jason, Ezechielos, Philo, Theodot, etc.), which have survived, we may easily conclude what an immense literature must have sprung up here within a few centuries in the midst of the Judeo-Egyptian community. To this is owing, likewise, the Greek translation of the Bible, known as the Septuagint (q.v.), which, in its turn, while it estranged the people more and more from the language of their fathers, the Hebrew, gave rise to a vast pseudo-epigraphical and apocryphal literature (*Orphica*, *Sibyllines*, *Pseudophoclea*; poems by Linus, Homer, Hesiod; additions to Esther, Ezra, the Maccabees, Book of Wisdom, Baruch, Jeremiah, Susannah, etc.), not to mention the peculiar Greco-Jewish philosophy, which sprang from a mixture of Hellenism and Orientalism, of which we have spoken at some length in the article *GNOSTICS*.

For a hundred years Judea herself remained under Egyptian rule. During the reigns of the first three Ptolemies, Soter, Philadelphus, and Euergetes, it prospered, but after the accession of Ptolemy Philopater, a change for the worse came over the fortunes of the Jews. Their fate became harder still under his son, Antiochus Epiphanes, or Epimanes (the madman). With every means a cruel and foolhardy policy could devise, this king outraged the religious feelings of the nation, and endeavored to tear out every root of the sacred creed. At different periods he sent his generals to Jerusalem to pillage and burn, and to force the Jews into the Greek religion. The temple at Jerusalem was finally dedicated to Jupiter Olympius; idol altars were built in every village, and the people forced to offer swine daily. Some yielded, many fled, the greater part preferred martyrdom in some shape or other.

At this juncture the heroic family of Matathia, a priest of the house of the Asmoneans, rose, together with a few patriots, against the immense power of the Syrians. The national cause quickly gathered strength, and after the death of Matathia (166), Judas Maccabæus (q.v.) led the national hosts to victory against the Syrians. After his

death (161 B.C.), his brothers Jonathan and Simon completed the work of deliverance, and reinstated the Sanhedrim (145 B.C.). During their rule, alliances were twice formed with the Romans, and the country once more began to prosper. Under Simon more especially, Syrian rule became a mere shadow: his was an almost absolute power. So much so, that in the year 170 of the Seleucidian era (142 B.C.), a new Jewish era was commenced, and public documents bore date. "In the first year of Simon, high-priest and chief of the Jews." Simon's son, John Hyrcanus, after a brief period of vassalage to the Syrians, extended his authority over Samaria, Galilee, and Idumea—his grand triumph, in the eyes of his countrymen, being the destruction of the Samaritan temple on Mt. Gerizim (129 B.C.); but in reality his most surprising success was the subjugation of the Idumeans, and their conversion to the Jewish religion. His son, Aristobulus, added Iturea—a district at the base of the Anti-Libanus—to his dominions, but died, after a short reign, of remorse for the murder of his mother, Salome Alexandra, to whom the secular dominion had been bequeathed by Hyrcanus, but whom Aristobulus had cast into prison, and caused there to die of hunger. The son who succeeded him was Alexander Jannaeus. Constantly fighting, and generally beaten, this king yet, strange to say, contrived to enlarge his territories; restless and enterprising as he was cruel and sanguinary, he gave his opponents no rest, and his opponents were all his neighbors in turn, excepting Cleopatra, queen of Egypt. Attached to the Sadducees (q.v.), like his father, and probably something of a pagan, he was disliked by the mass of his countrymen, and a civil war of six years' duration ensued. After a brief period of peace, he died (78 B.C.), recommending, however, his wife, Alexandra, to throw herself into the arms of the very party who had thwarted him all his life, the Pharisees (q.v.), as the best way of retaining her authority. This she did; and governed, on the whole, prudently for nine years. The Pharisaic party, however, abused the power which fell into their hands, and a reaction took place. Aristobulus, youngest son of the queen, and a prince of great spirit, placed himself at the head of the movement, marched to Jerusalem, took possession of the city, and ejected his elder brother, Hyrcanus II., from the sovereignty. Afterwards, however, the latter, at the instigation of Antipater, the Idumean, and father of Herod the great, fled to Aretas, king of northern Arabia, who was induced, by the promise of a cession of the territory which had been acquired by Alexander Jannaeus, to take up arms on his behalf. This led to the interference of the Romans, who were then fighting both in Syria and Armenia. After several vicissitudes, Jerusalem was captured (63 B.C.) by Pompey, who had decided in favor of Hyrcanus, and Judaea made dependent on the Roman province of Syria, and Hyrcanus appointed ethnarch and high-priest. Aristobulus, however, with his two sons, Alexander and Antigonus, and two daughters, were carried captive to Rome.

In 54 B.C., Licinius Crassus plundered the temple which Pompey had piously spared; his ill-gotten gains are said to have amounted to £2,000,000. He fell shortly afterwards in the war against the Parthians, and his companion, Cassius Longius, succeeded in completely routing Aristobulus's army.

Meanwhile, the war between Cæsar and Pompey broke out. In Syria, the partisans of the latter were numerous, and contrived to poison Aristobulus, and execute his son Alexander, who were Cæsareans (49 B.C.). After the death of Pompey, however, things changed; and Hyrcanus, or rather Antipater the Idumean (who was both his minister and master), saw the necessity of securing the favor of Cæsar. With Hyrcanus II. ended the line of Asmonean princes: they exercised (nominally) supreme authority both in the civil and religious affairs of Palestine, i.e., they were both sovereigns and high-priests; but, as we have already indicated, the real religious authority had passed into the hands of the priesthood, and especially of the Sanhedrim (q.v.). The Idumean dynasty, which succeeded the Asmonean, virtually commenced with Antipater, who prevailed on Cæsar to restrict Hyrcanus to the high-priesthood, and obtained for himself the office of procurator of Judæa, while his eldest son Phazael was appointed governor of Jerusalem, and his younger son Herod governor of Galilee. The Jewish or national party took the alarm at this sudden increase of Idumean power; strife ensued; and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B.C.), caused Antigonus, the last male representative of the Asmonean line, and his most dangerous enemy, to be put to death, and commenced the difficult task of governing a people who were growing more and more unruly every day. The political events which occurred during the government of the Herods are briefly touched upon under the heads Herod (q.v.), Agrippa (q.v.), and Antipater (q.v.).

After Herod's death (3 B.C.), Archelaus, one of his sons, ruled Judæa and Samaria; but his arbitrariness, and still more his constant attacks upon religion, made him hateful to the people; and Augustus, listening to their just complaints, deprived him of his power, and banished him to Vienne (6 A.D.). Judea was now thrown together with Syria, and was ruled by Roman governors.

In the year 38 A.D., the emperor Caligula issued an edict ordering divine honors to be paid to himself. Everywhere throughout the Roman dominions the Jews refused to obey. At Alexandria a frightful massacre took place, and for a moment it seemed as if the whole of the inhabitants of Judea, too, were doomed to perish; but Herod Agrippa I. (q.v.), tetrarch of northern Palestine, and a friend of Caligula dissuaded the

emperor from carrying out his barbarous design. About the same time, the Babylonian Jews became involved in a quarrel with the Parthians, and were slaughtered in vast numbers. The accession of Claudius, on the assassination of Caligula, seemed, however, the dawn of a brighter day for them. Herod Agrippa, a loyal friend and favorite of the new emperor, obtained anew the dominion over all the parts once ruled by his grandfather Herod, and many privileges were through his influence granted to his Jewish subjects, and even to foreign Jews. They received the rights of Roman citizenship (41 A.D.), and Herod even tried to conciliate their religious prejudices by the strictness with which he observed their law (a circumstance, we may say, in passing, that will account for his persecution of the Christians); yet the national party remained malcontent, and in an almost permanent state of mutiny. After the death of Herod Agrippa I. (his son being but a youth of seventeen) the country was again subjected to Roman governors. The confusion soon became indescribable. The whole land was overrun with robbers and assassins, some of whom professed to be animated by religious motives (such as the Sicarii), while others were mere ruffianly freebooters and cut-throats; the antipathy between Jews and Samaritans waxed fiercer and fiercer, and the latter waylaid and murdered the orthodox Galileans as they went up to worship at Jerusalem; all sorts of impostors, fanatics, and pretenders to magic made their appearance; the priesthood was riven by dissensions; the hatred between the populace and the Roman soldiery (mostly of Graeco-Syrian origin), and under the commands of cruel procurators, such as Albinus and Gessius Florus, increased; frightful portents (according to Josephus) appeared in the heavens, until, in 66 A.D., in spite of all the precautionary efforts taken by Agrippa, the party of Zealots, i.e., the Sicarii or Assassins, burst into open rebellion, which, after a horrible carnage (Josephus calculates the number killed at 1,356,460), was terminated (70 A.D.) by the conquest of Jerusalem by Titus, the destruction of the temple, and the massacre and banishment of hundreds of thousands of the unhappy people, who were scattered among their brethren in all parts of the world. The defense of Jerusalem (as narrated by Josephus) is one of the most magnificent and melancholy examples of mingled heroism and insanity that the world affords. Still, very considerable numbers were allowed to remain in their native country, and for the next thirty years, although both hated and treated with rigor, they appear, on the whole, to have flourished. The emperor Nerva was as lenient to them as to the rest of his subjects; but as soon as they had attained some measure of political vitality, their turbulent and fanatical spirit broke out anew. Their last attempts to throw off the Roman yoke, at Cyrene (115 A.D.), Cyprus (116 A.D.), Mesopotamia (118 A.D.), and Palestine, under Bar-Cochba (q.v.), (130 A.D.), were defeated after enormous and almost incredible butchery. The suppression of Bar-Cochba's insurrection (135 A.D.) marks the final desolation of Judea, and the dispersion of its inhabitants. Talmud and Midrash (especially *Midrash Echa*) appear to exhaust even eastern extravagance in describing what followed the capture of Bither—the great stronghold of the Jews. The whole of Judea was made like a desert, about 985 towns and villages lay in ashes, 50 fortresses were razed to the ground: the name of Jerusalem itself was changed into *Elia Capitolina*, and a heathen colony settled in the city, from entering which every Jew was strictly debarred. The hardships to which the unfortunate race were subjected were again alleviated in the reign of Antoninus Pius, whom the Jewish writers represent as secretly attached to their religion (see Jost's *Geschichte der Israeliten*, etc.), and better times seemed in store for the homeless exiles. Alexander Severus also placed Abraham on the same divine level as he did Christ, and obtained from the grateful people the title of "father of the synagogue." Heliogabalus, among his many senseless whims, patronized various Jewish practices, such as circumcision and abstinence from swine's flesh; and generally speaking, from the close of the 2d c. till the establishment of Christianity under Constantine (330 A.D.), when their hopes were once more dashed to the ground, the Jews of the Roman empire appear to have thriven astonishingly. In this period falls the redaction of the chief code and basis of the "Oral Law," the Mishna (q.v.) completed by Jehuda Hanassi (the prince), or *Hakkulosh* (the saint), president of the great school at Tiberias (220); upon which code were grafted subsequently the two gigantic commentaries or complements, the Palestinian and the Babylonian Gemaras (q.v.). The Babylonian Jews were even more fortunate than their western brethren, though they did not perhaps attain the meridian of their prosperity till the revival of the Persian, on the downfall of the Parthian empire. Their leader was called "The Prince of the Captivity" (*Resh Gelutha*), and was chosen from among those held to be descended from the house of David. He lived in great splendor, assumed among his own people the style of a monarch (though extremely submissive to the Parthian or Persian ruler), had a bodyguard, counselors, cup-bearers, etc.; his subjects were, many of them, at least, extremely wealthy, and pursued all sorts of industrial occupations. They were merchants, bankers, artisans, husbandmen, and shepherds; and in particular had the reputation of being the best weavers of the then famous Babylonian garments. In fact, his government was quite an *imperium in imperio*, and possessed a thoroughly sacerdotal or at least theocratic character. The reputation for learning of the Babylonian schools, Nahardea, Sura, and Pumbeditha, was very great. What was their condition at this time further east we cannot tell, but it seems quite certain that they had obtained a footing in China, if not before the time of Christ, at least during the 1st century. They were first discovered

by the Jesuit missionaries of the 17th century. They did not appear ever to have heard of Christ, but they possessed the book of Ezra, and retained, on the whole, a very decided nationalism of creed and character. From their language, it was inferred that they had come originally from Persia. At one time, they would appear to have been highly honored in China, and to have held the highest civil and military offices.

Reverting to Europe the ascendancy of Christianity, as we have already said, was baneful to the Jews. Imperial edicts and ecclesiastical decrees vied with each other in the rigor of their intolerance towards this unhappy people. They were prohibited from making converts, from invoking (in Spain at least) the divine blessing on the country, from marrying Christian women or holding Christian slaves; they were burdened with heavy taxes; yet no persecution apparently could destroy the immortal race. About this time they are found in large numbers in Illyria, Italy, Spain, Minorca, Gaul, and the Roman towns on the Rhine; they are agriculturists, traders, and artisans; they hold land; their services, in fact, cannot be dispensed with; Constantine, during whose reign a fierce revolution, incited by his co-regent, Gallus, broke out among the Arians and Jews (353), terms them, in a public document, "that most hateful of all people;" yet in spite of this, they fill important civil and military situations, have special courts of justice, and exercise the influence that springs from the possession of wealth and knowledge. The brief rule of Julian the apostate even shed a momentary gleam of splendor over their destinies, and the transport which they manifested on obtaining his permission to rebuild the temple at Jerusalem, is one of the most sublime spectacles in their history. The death of this emperor, however, frustrated their labors, and the rapid increase of ecclesiastical power was, of course, hurtful to them in a variety of ways, although the emperors now began, in the decline of their authority, to protect them as far as they could. In 418 A.D. they were excluded from the military service; and in 429 A.D. the patriarchate at Tiberias was abolished. After the fall of the West Roman empire their fortunes were different in different countries. In Italy, Sicily, and Sardinia they were for a time almost unmolested; in the Byzantine empire they suffered many oppressions; while in the 6th and 7th c., the Franks and Spanish Visigoths inflicted on them frightful persecutions.

The sudden volcanic outburst of Mohammedanism in the Arabian peninsula was at first disastrous to the Jews in that part of the world. For several centuries, a Jewish kingdom had existed in the s.w. of Arabia. It was called Himyaritis or Homeritis, and was in a flourishing condition 120 years before Christ. About 230 A.D., the Jewish religion even mounted the throne of Yemen. Twice, however (by the Ethiopian kings, Aidog and Ez-Baha), were the Jewish kings driven from it, and the Christian religion was introduced in that part in 530 A.D. At first Jewish tribes around Mecca and Medina entertained opinions favorable to Mohammed as an Arabian chief, but when Islam began to threaten their own faith, and even existence, they rose in arms against its founder. Mohammed proved the stronger: he subdued the Chaibar tribes in 627 A.D., and the Arabian Jews were finally dispossessed of their territories, and removed to Syria. The spread of Mohammedanism through Asiatic Turkey, Persia, Egypt, Africa, and the s. of Spain was, nevertheless, on the whole advantageous to the Jews. Excepting accidental persecutions, such as those in Mauritania (790 A.D.) and in Egypt (1010 A.D.), they enjoyed, under the caliphs and Arabian princes, comparative peace. In Moorish Spain their numbers greatly increased, and they became famous for their learning as well as for trade. They were counselors, secretaries, astrologers, or physicians to the Moorish rulers; and this period may well be considered the golden age of Jewish literature. Poets, orators, philosophers of highest eminence arose, and not isolated, but in considerable numbers; and it is a well-established fact that to them is chiefly due—through the Arab medium—the preservation and subsequent spreading of ancient classical literature, more especially philosophy, in Europe. There are some medical works belonging to ancient Greece even now extant only in their Arabic translations, the originals being probably lost forever. Different from their fate under Moslem rule was that which they had to endure in Christendom about this period. Only few and far between were those Christian monarchs who rose above the barbarism of the churches. About the beginning of the 11th c. the Byzantine emperor, Basil II., renewed the persecution; from quite different causes the same thing had already begun in Babylonia, where the caliphate had passed into the hands of rulers hostile to the Jews; and before the close of the 11th c. the Prince of the Captivity had perished on the scaffold, the schools were closed, the best of the community had fled to Spain, and those that remained were reduced to an abject condition from which they have never risen. In Italy their position was made tolerable by considerable pecuniary sacrifices. Here and there, at intervals, a spirit of Christian intolerance might break out, but they enjoyed for the most part the protection of the popes.

More favorable was their lot during the 8th and 9th centuries in France, especially in Paris, Lyons, Languedoc, and Provence. At the court of *Louis le Débonnaire* they were actually all-powerful. After 877 A.D., however, when the weak Carlovingians had begun to rule, and the church was advancing with imperious strides, a melancholy change ensued—kings, bishops, feudal barons, and even the municipalities, all joined in a carnival of persecution. From the 11th to the 14th c. their history is a successive series of massacres. All manner of wild stories were circulated against them: it was said

that they were wont to steal the host, and to contemptuously stick it through and through; to inveigle Christian children into their houses, and murder them; to poison wells, etc. They were also hated for their excessive usury, though there can be no doubt that more blame is attachable to those whose tyranny, by depriving them of the right to possess land, had compressed their activity into the narrower channels of traffic. Occasionally, however, their debtors, high and low, had recourse to what they called Christian religion as a very easy means of getting rid of their obligations. Thus, Philippe Auguste, under whose rule the Jews seem to have held mortgages of enormous value on the estates of church and state dignitaries, simply confiscated the debts due to them, forced them to surrender the pledges in their possession, seized their goods, and banished them from France; but the decree appears to have taken effect chiefly in the n.; yet in less than 20 years the same proud but wasteful monarch was glad to let them come back and take up their abode in Paris. Louis IX., who was a very pious prince, among other religious acts, canceled a third of the claims which the Jews had against his subjects, "for the benefit of his soul." An edict was also issued for the seizure and destruction of their sacred books; and we are told that, at Paris, 24 carts filled with copies of the *Talmud*, etc., were consigned to the flames. In the reign of Philippe the fair they were again expelled from France (1306 A.D.) with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, in little more than a dozen years, to recall them; and they were allowed to enforce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic, known as the rising of the shepherds, having seized the common people in Languedoc and the central regions of France (1321 A.D.), they signalized themselves by horrible massacres of the detested race; so horrible, indeed, that in one place, Verdun, on the Garonne, the Jews, in the madness of their agony, threw down their children to the *Christian* mob, from the tower in which they were gathered, hoping, but in vain, to appease the demoniacal fury of their assailants. In the following year the plague broke out, and the wildest crimes were laid to their charge. One shudders to read of what followed; in whole provinces every Jew was burned. *At Chinon a deep ditch was dug, an enormous pile raised, and 160 of both sexes burned together!* Yet Christianity never produced more resolute martyrs; as they sprung into the place of torment, they sang hymns as though they were going to a wedding. Finally, in 1395, they were indefinitely banished from the middle of France.

Their first appearance in England dates from the period of the Saxons. They are mentioned in the ecclesiastical constitutions of Egbert, archbishop of York, 740 A.D.; they are also named in a charter to the monks of Croyland, 833 A.D. William the conqueror and his son, William Rufus, favored them; the latter, on the occasion of a public debate between them and the Christians, even swore with humorous profanity that if the rabbins beat the bishops, "by the face of St. Luke" he would turn a Jew himself. The same reckless monarch carried his contempt for the religious institutions of his kingdom so far that he actually farmed out the vacant bishoprics to the Jews; and at Oxford, even then a seat of learning, they possessed three halls—Lombard hall, Moses hall, and Jacob hall, where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth they grew in unpopularity. On the day of the coronation of Richard the lion heart (1189 A.D.), some foreign Jews, being perceived to witness the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and burned; and though sir Richard Glanville, the chief-justiciary of the realm, acting under the orders of the indignant king, partially succeeded in arresting the havoc, and even in bringing some of the mob to justice (three were hanged), yet the barbarous bigotry of priests and people prevented anything like just or salutary punishment. Similar scenes were witnessed at Norwich, Edmundsbury, Stamford, and York; in the last of these towns, most of the Jews preferred voluntary martyrdom (*Kiddush Hashem*) in the synagogue to forced baptism. When Richard returned from Palestine their prospects brightened a little; though still treated with great rigor, yet their lives and wealth were protected—for a consideration! John Lackland at first covered them with honor, but the popular and priestly hatred only became the stronger; and on a sudden, the vacillating and unprincipled king turned round on his protégés, after they had accumulated great wealth, and imprisoned, maltreated, and plundered them in all parts of the country. Under Henry III. they were maimed enormously. Accused of clipping the coin of the realm, they had, as a penalty, to pay into the royal exchequer (1230 A.D.) a third of their movable property. To this reign belongs the now exploded story of the crucifixion of the Christian boy, *Hugh of Lincoln*. The accession of Edward did not mitigate their misery; some efforts, indeed, were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period, but the fact is, that they were so heavily taxed by the sovereigns or governments of Christendom, and at the same time debarred from almost every other trade or occupation—partly by special decrees, partly by the vulgar prejudice—that they could not afford to prosecute ordinary avocations. The attempt made by the Dominican friars to convert them, of course, failed utterly; and in 1253 the Jews—no longer able to withstand the constant hardships to which they were subjected in person and property—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded

them to stay. Ultimately, in 1290 A.D., they were driven from the shores of England, pursued by the execrations of the infuriated rabble, and leaving in the hands of the king all their property, debts, obligations, and mortgages. They emigrated for the most part to France and Germany. Their number is estimated at about 16,000.

In Germany they were looked upon as the special property of the sovereign, who bought and sold them, and were designated his *Kammerknechte* ("chamber-servants"). As already said, they made their appearance in that region almost as early as the time of Constantine. About the 8th c. they are found in all the Rhenish towns; in the 10th c., in Saxony and Bohemia; in the 11th, in Swabia, Franconia, and Vienna; and in the 12th, in Brandenburg and Silesia. The same sort of treatment befell them in the empire as elsewhere; they had to pay all manner of iniquitous taxes—body-tax, capitation-tax, trade-taxes, coronation-tax, and to present a multitude of gifts, to mollify the avarice or supply the necessities of emperors, princes, and barons. A raid against the Jew was a favorite pastime of a bankrupt noble in those days. The crusades kindled a spirit not in Germany only, however, but through all Christendom, hostile to the "enemies of Christ." Treves, Metz, Cologne, Mainz, Worms, Spires, Strasburg, and other cities, were deluged with the blood of the "unbelievers." At such epochs, the passions of the populace and of the lower clergy could not be restrained. The word *hep* (said to be the initials of *Hierosolyma est perdita*, Jerusalem is taken) throughout all the cities of the empire became the signal for massacre, and if an insensate monk sounded it along the streets, it threw the rabble into paroxysms of murderous rage. The Jews were expelled—after being plundered and maltreated—from Vienna (1196 A.D.), Mecklenburg (1225 A.D.), Breslau (1226 A.D.), Brandenburg (1243 A.D.), Frankfort (1241 A.D.), Munich (1285 A.D.), Nuremberg (1390 A.D.), Prague (1391 A.D.), and Ratisbon (1476 A.D.). The "Black Death," in particular, occasioned a great and widespread persecution (1348–50 A.D.). They were murdered and burned by thousands, and many even sought death amidst the conflagrations of their synagogues. The race almost disappeared from Germany; only, however, to return, for their services were indispensable. Only here and there, however, they possessed the rights of citizens, or were allowed to hold unmovable property; in general, they were permitted to prosecute only commerce and usury, and the law turned on them its harshest aspect. Repeatedly, too, the emperors gratified at once their piety and their greed by canceling their pecuniary claims. In many places, they were compelled to live in certain parts of the town, known as the *Judenstrasse* (Jews' streets).

Switzerland, whither they came at a comparatively late period, commenced to persecute them about the middle of the 14th century. In the course of the 15th c. they were expelled from Schaffhausen, Zürich, Geneva, Thurgau, and other places.—Their treatment was more humane in Poland and Lithuania. As early as 1264 A.D. they enjoyed in these countries certain important privileges. Favored by Casimir III. their numbers were swelled, after 1348 A.D., by fugitives from Germany and Switzerland.—Russia and Hungary, like most other countries of Christendom during the middle ages, received, persecuted, and banished them.

In Spain the condition of the Jews was long highly favorable. The horrible persecutions of the Gothic princes in the 6th and 7th centuries made it, of course, absolutely inevitable that the first gleam of a Moorish scimiter on the coast would turn them into allies of the invaders. During the whole of the brilliant period of Moorish rule in the Peninsula they enjoyed, indeed, what must have seemed to them, in comparison with their common fate, a sort of elysian life. They were almost on terms of equality with their Mohammedan masters, rivaled them in civilization and letters, and probably surpassed them in wealth. The Spanish Jews were consequently of a much higher type than their brethren in other parts of Europe. They were not reduced to the one degrading occupation of usury, though they followed that too; on the contrary they were husbandmen, landed proprietors, physicians, financial administrators, etc.; they enjoyed special privileges, and had courts of justice for themselves. Nor was this state of things confined to those portions of Spain under the sovereignty of the Moors; the Christian monarchs of the north and middle gradually came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile. But the extravagance and consequent poverty of the nobles, as well as the increasing power of the priesthood, ultimately brought about a disastrous change. The estates of the nobles and (it is also believed) those attached to the cathedrals and churches, were in many cases mortgaged to the Jews; hence it was not difficult for "conscience" to get up a persecution, when goaded to its "duty" by the pressure of want and shame. Gradually, the Jews were deprived of the privilege of living where they pleased; their rights were diminished, and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca, outbursts of priestly and popular violence took place (1391–92 A.D.); immense numbers were murdered, and wholesale theft was perpetrated by the religious rabble. Escape was possible only through flight to Africa, or by accepting baptism at the point of the sword. The number of these enforced converts to Christianity is reckoned at 200,000. The fate of the Jews in Spain during the 15th c., however, beggars description. Persecution, violent conversion, massacre, the tortures of the inquisition—we read of nothing but these! Thousands were burned alive. "In one year, 280 were burned in Seville alone." Sometimes the popes, and even the

nobles, shuddered at the fiendish zeal of the inquisitors, and tried to mitigate it, but in vain. At length the hour of final horror came. In 1492 A.D. Ferdinand and Isabella issued an edict for the expulsion, within four months, of all who refused to become Christians, with the strict inhibition to take neither gold nor silver out of the country. The Jews offered an enormous sum for its revocation, and for a moment the sovereigns hesitated; but Torquemada, the Dominican inquisitor-general, dared to compare his royal master and mistress to Judas; they shrank from the awful accusation; and the ruin of the most industrious, the most thriving, the most peaceable, and the most learned of their subjects—and consequently of Spain herself—became irremediable. This is perhaps the grandest and most melancholy hour in their modern history. It is considered by themselves as great a calamity as the destruction of Jerusalem. 300,000 (some even give the numbers at 650,000 or 800,000) resolved to abandon the country, which a residence of seven centuries had made almost a second Judea to them. The incidents that marked their departure are heart-rending. Almost every land was shut against them. Some, however, ventured in France; others into Italy, Turkey, and Morocco, in the last of which countries they suffered the most frightful privations. Of the 80,000 who obtained an entrance into Portugal on payment of eight gold pennies a head, but only for eight months, to enable them to obtain means of departure to other countries, many lingered after the expiry of the appointed time, and the poorer were sold as slaves. In 1495 A.D. king Emanuel commanded them to quit his territories, but just at the same time issued a secret order that all Jewish children under 14 years of age should be torn from their mothers, retained in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness: they destroyed their children with their own hands, and threw them into wells and rivers, to prevent them from falling into the hands of their persecutors. The miseries of those who embraced Christianity, but who, for the most part, secretly adhered to their old faith (*Onssim, Anussim*—"yielding to violence, forced ones"), were hardly less dreadful, and it was far on in the 17th c. before persecution ceased. *Autos-da-fé* of suspected converts happened as late as 1655 A.D.

The wanderers appear to have met with much better treatment in Italy and Turkey than anywhere else. During the 15th and 16th centuries they are to be found—except at intervals, when persecution applied its scourge—in almost every city of Italy; pursuing various kinds of traffic (nearly the whole trade of the Levant, for instance, was in their hands), but chiefly engaged in money-lending, in which they rivaled the great Lombard bankers. Abrabanel, perhaps the most eminent Jewish scholar and divine of his day, rose to be confidential adviser to the king of Naples. In Turkey they were held in higher estimation than the conquered Greeks; the latter were termed *teshir* (slaves), but the Jews, *monsaphir* (visitors); they were allowed to reopen their schools, to establish synagogues, and to settle in all the commercial towns of the Levant.

The invention of printing, the revival of learning, and the reformation are generally asserted to have been beneficial to the Jews, but this can be regarded as true only in a certain sense. When the Jews began to use the presses at their earliest stage for their own literature, sacred and otherwise, the emperor Maximilian was urged—chiefly by converts—to order all Hebrew writings to be committed to the flames; and but for the strenuous exertions of Reuchlin (q.v.), ignorance, treachery, and bigotry might have secured a despicable triumph. Luther, in the earlier part of his career, at least, looked with no unfavorable eye on the adoption of violent means for their conversion; and, on the other hand, we find at least one distinguished Roman Catholic, pope Sextus V., animated by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1588 he abolished all the persecuting statutes of his predecessors, allowed them to settle and trade in every city of his dominions, to enjoy the free exercise of their religion, and, in respect to the administration of justice and taxation, placed them on a footing with the rest of his subjects. That the reformation itself had nothing to do with subsequent ameliorations in the condition of the Jews, is only too plain from the fact that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1553 A.D.), out of Brandenburg (1573 A.D.), and similar treatment befell them elsewhere. They also excited numerous popular tumults (as late even as 1730 A.D. in the Protestant city of Hamburg); and, in fact, during the whole of the 17th and the first part of the 18th c. the hardships inflicted on them by the German governments positively became more and more grievous. What really caused the change in their favor was the great uprising of human reason that marked the middle of the 18th century. Among the writers who distinguished themselves in Germany by pleading the cause of the Jews, we may specially mention Lessing (q.v.), Mendelssohn (q.v.), and Dohm.

Holland, as we know, was one of the first countries in modern times to rise out of the barbarism of the middle ages. Its active, energetic, intelligent inhabitants appreciated the business qualifications of the Jews, and as early as 1603 A.D., permitted them to settle and trade, though they did not acquire the rights of citizenship till 1796 A.D. In England, the edict of Edward I. remained in force for more than 300 years; and the first attempt made by the Jews to obtain a legal recognition in that country was during the protectorate of Cromwell in 1655 A.D. Cromwell himself was favorable to their admission; so were the lawyers; but the nation generally, and particularly the emphatically religious portion of it, were strongly hostile to such a proceeding; and the wearis-

some, controversial jangling of the divines appointed to consider the question, prevented anything from being done till the reign of Charles II., who, standing much and frequently in need of their services, permitted them quietly to settle in the island. In 1723 A.D. they acquired the right to possess land; in 1753 A.D. they obtained the right of naturalization. Since 1830 civic corporations, since 1833 the profession of advocates, and since 1845 the office of alderman and of lord-mayor have been opened to them. The last and crowning triumph of the principle of toleration was achieved in 1858 by the admission of Jews into parliament.

Some of the relics of that mighty host of exiles that left Spain and Portugal found their way into France, where they long lingered in a miserable condition. In 1550 A.D. they were received into Bayonne and Bordeaux; they were also to be found in considerable numbers in Avignon, Lorraine, and Alsace. In 1784 the capitulation-tax was abolished. In 1790, while the French revolution was still in its pristine vigor, and animated by a sincere humanitarianism, the Jews presented a petition to the national representatives claiming equal rights as citizens. Mirabeau was among their advocates, and their cause could not, therefore, be unsuccessful. From this time their technical designation in France has been *Israelites*. In 1806 the emperor Napoleon summoned a "Sanhedrim" of Jews to meet at Paris, to whom a variety of questions were put, mainly with a view to test their fitness for being French citizens. Their answers were satisfactory, and they were allowed to reorganize their religious institutions in the most elaborate manner. Since then, no material change has taken place in the laws regarding them; and they are since then found not only in the highest offices of the civil administration—very frequently in the ministry (e.g., Crémieux, Goudchaux, Fould)—but they also fill some of the chief places in the army and navy. We may add here that their surpassing bravery in the field has been the subject of frequent remark, more especially since among the vices with which a brutal prejudice loved to brand them, in spite of all historical evidence, was also that of cowardice.—In Denmark, since 1814 A.D., they have been on a footing of equality as citizens with native Danes.—In Sweden they did not obtain admission till 1776 A.D., and then only into Stockholm and three other towns. Citizenship is still conferred as a favor.—Norway forbade them to touch its soil till 1860 A.D.—Admitted into Russia proper by Peter the great, they were expelled—to the number of 35,000—by the empress Elizabeth in 1743. Readmitted by the empress Catharine II., they were further protected by the emperor Alexander I., who in 1805 and 1809 issued decrees, insuring them full liberty of trade and commerce; but of the liberties which he conferred upon them they were deprived by the late emperor, Nicholas. Since 1835 a scheme of gradual emancipation has been under contemplation.—Poland, however, has become their principal residence. There they are more numerous than in any other part of the world. They owed their first humane reception in the 14th c. to the love which king Casimir the great bore for a Jewish mistress. For many years the whole trade of the country was in their hands. During the 17th and the greater part of the 18th c., however, they were much persecuted, and sank into a state of great ignorance, and even poverty; but education—in spite of the severity and barbarism of Russian intolerance—has, since the French revolution, made progress among them.—Frederick the great, king of Prussia, showed himself singularly harsh towards the Jews; in fact, his legislation, it has been said, almost throws us back into the middle ages. All manner of iniquitous and ridiculous taxes were laid upon them; only a certain number were allowed to reside in the country, and these were prohibited both from the most honorable and the most lucrative employments. This shameful state of matters was ended by the Prussian edict of toleration (1812 A.D.), by which Jews were placed almost in an equal position as citizens with other Prussians. Since then the tendency, on the whole, had been to enlarge their "liberties"—until the revolution of 1848 finally gained them their full emancipation, although, owing to the subsequent reaction, it was slowly carried out.—In the smaller German states their full rights have likewise—gradually and grudgingly—been conceded to them at last. The first German national assembly held in Frankfort in 1848 contained many prominent Jewish members. Lasker, the leader of the national liberal party in the Reichstag of the new German empire, is a Jew.—In Austria the emperor Joseph II. distinguished himself by passing an act of toleration. 1782 A.D. This act was extraordinarily liberal in its provisions for the Jews. Not till 1860, however (and even then under certain restrictions), did they acquire the right to possess land.—In Hungary and Transylvania they have long enjoyed important privileges, and have been protected by the nobility. As a consequence, in the late Hungarian insurrection, they were patriotic to a man.—Spain began to tolerate them again in 1837 A.D., and they can follow trade or agriculture like other Spaniards; but few Jews have as yet dared to venture back to a land that fills them with the most mournful recollections.—Portugal, where they enjoy no civic rights, has only a few German Jews.—Switzerland long treated them harshly, and only of late years have a few cantons taken a step in the right direction.

In other countries their condition must be merely referred to. In Turkey they are very numerous, and have thriven in spite of the exactions of pashas, the insolence of janizaries, and the miseries of war. The communities in Constantinople, Adrianople, Saloniki, Smyrna, Aleppo, and Damascus, are considerable; in Palestine, their ancient home, they are said to be rapidly increasing, but they are still, in spite of the many

efforts on the part of their European brothers to ameliorate their condition, very poor. Their numbers in Arabia are not very large, yet they enjoy some independence. Those in Persia have sunk into ignorance through oppression, yet it is touching to find that they are not hopeless. "Heavy," they say, "is our slavery; anxiously we wait for redemption." They exist in Afghanistan, and carry on a trade between Kabul and China; in India and Cochin-China, where they are both agriculturists and artisans; in Surinam there is a flourishing colony; in Bokhara, where they possess equal rights with the other inhabitants, and are skilled in the manufacture of silks and metals; in Tartary and China, where, however, they are very insignificant both in numbers and position. They are also found all along the North African coast, where, indeed, they have had communities for perhaps more than a thousand years, which were largely reinforced in consequence of the great Spanish persecutions. They are numerous in Fez and Morocco; though they are not always free from the perils of Mohammedan fanaticism. In Egypt and Nubia they are few; in Abyssinia, more numerous; and it is ascertained that they have even made their way into the heart of Africa; they exist in Sudan, and are also found further south. America, too, has invited their spirit of enterprise. In the United States, as in Great Britain, they enjoy absolute liberty. They have been in Brazil since 1625, and in Cayenne since 1639, and are also settled in some parts of the West Indies.

The entire number of Jews in the world is reckoned variously between 3,500,000 and 15,000,000. A recent estimate gives their number at about 5,000,000, of which upwards of 3,500,000 are assigned to Europe; about 205,000 to Asia; about 750,000 to Africa, and about 105,000 to America. There are in Germany, inclusive of the whole of Austria and Prussia, about 1,440,000, of whom 1,049,871 are in Austria, and 260,751 in Prussia. According to the Russian census of 1870, the number of Jews in European Russia was 2,759,811.

LANGUAGE AND LITERATURE.—*Language.* Among the Semitic family of languages, the Hebrew (called in the Old Testament the speech of Canaan; in the later portions of the same book the speech of Judea; and first in the Chaldee targums the sacred language, or rather the language of the sanctuary and things connected with it—as the law [mishnah], the prayers, etc.) is one of the oldest, and in regard to strength, refinement, and elaborate completeness of grammatical structure, one of the most remarkable. (Its chief characteristics will be found noticed under SEMITIC LANGUAGES.) Yet it is neither the oldest of Semitic dialects, nor, as was long believed, the first of all human languages. Once identical with the Phenician, it was adopted by Abraham and his family in Palestine. The peculiar religious and moral notions of the Hebrews could not but impress upon it by degrees a distinct character, and thus Hebrew became a distinct dialect. Although the sacred writings are the oldest Semitic works which we possess, there is yet, except a few archaisms, hardly any trace of the primitive state of the Hebrew language preserved in them; they belong to periods when it was nearly as fully formed and developed as in the time of the exile. The differences in style, manner, and idiom in the different books must rather be traced to the individualities of the various writers. In general, we distinguish two distinct periods—the golden age, up to the Babylonian exile, when, except a few Egyptian words, no foreign admixture mars the purity of the language; the second, from the exile downwards, when Persian and Aramaic elements had largely been introduced. As we find it in the Bible the Hebrew is a poor language enough; yet there is a sublime grandeur, and, in the provinces of religion and agriculture, also a richness, inherent in it which surpasses almost every ancient and modern language. It is hardly to be presumed, in the absence of distinct traces, that there should have been, within the small compass of Palestine, room for several dialects. The different pronunciations of the *shin* alluded to in Judges xii. must have been only a solitary peculiarity of the Ephraimites, as, at a later period, the Galileans, and also the inhabitants of Jerusalem, were known for their faulty pronunciation, as shown in several passages of the New Testament and the Talmud. The Hebrew character still universally employed in writing, and called *square*, Assyrian, or Babylonian character, first takes the place, at an uncertain period after the exile, of the older national alphabetic character, which was common in the age of Moses, and in any case, was similar to the old Phenician.

A grammatical treatment of Hebrew first commenced after the language ceased to be spoken by the people. The vocalization and accentuation of the text originated in the 6th and 7th centuries after the time of Christ (see MASORA). The Jews made the first attempt at a system of grammar about the dawn of the 10th c., after the example of the Arabians, and originally even in the Arabian language. Rabbi Saadia Gaon (d. 942 A.D.), Jehuda Chajug (*circa* 1050 A.D.), Abraham-ben-Esra (*circa* 1150 A.D.), and David Kimchi (*circa* 1190–1200), are held in classic repute as grammarians. The Hebrew dictionary of the latter was long considered the best that had been executed. The founder of the study of Hebrew among Christians was the famous Johann Reuchlin (d. 1522 A.D.), who, however, like the grammarians of the next age, Buxtorf and others, strictly adhered to the Jewish tradition and method. A new era began when the study of the other members of the Semitic family of languages, the Syriac, the Arabic, and the Ethiopic, enlarged the Hebraist's field of view; the heralds of this era were the German scholars, Alb. Schultens (d. 1750) and Nik. W. Schröder (d. 1798), who sought to remedy the one-sided, defective method into which the so-called Dutch school fell by its

too exclusive regard for Arabic. Gesenius, especially, along with a comprehensive and due consideration of all the allied languages, devoted his attention to the critical observation and exposition of the individual grammatical facts, and a more just and harmonious explanation of them. Since then Ewald (q.v.), who treats the Hebrew language as an organism after the historicogenetic method, has carried the study still further, and in some measure superseded Gesenius. Ewald's *Grammatik der Hebr. Sprache* (Leip. 1844); Gesenius, *Hebräische Grammatik* (Leip. 1813); the 16th edition by Rödiger (Leip. 1851), are the best-known grammars. The most comprehensive Hebrew dictionary is that by Gesenius, entitled *Thesaurus Linguae Hebraicae* (Leip. 1829-42); the best of the smaller lexicons are Gesenius's *Hebr. und Chald. Handwörterbuch über das Alte Testament* (2 vols. Leip. 1810-12; 7th ed. 1868); Winer's *Lexicon Manuale Hebraicum et Chaldaicum* (Leip. 1828); and Fürst's *Hebr. und Chald. Handwörterbuch* (Leip. 1857-61).

Literature.—The extraordinary influence which the religion of the Hebrews has exercised on Christian and Mohammedan nations has given a universal significance to their ancient literature. In antiquity and credibility, in the religiousness of its form and the vigor of its poetry, it surpasses the literature of any other pre-Christian people, and thus constitutes both the most remarkable monument and the most authentic source of the early history and spiritual development of the human race. It is true, however, that only a comparatively scanty portion of it has come down to the present day, and even the contents of what is extant have by no means remained unaltered in the lapse of ages. It is quite certain that the Hebrews, in the earliest times, only engraved or cut out on stone, metal, or wood what is said to have been executed in writing; nor is there any trace of a material adapted for the record of lengthened compositions before the period of David, and even then the writing of books was still a matter of rare occurrence. Besides, several writings of the Hebrews, held to be of ancient date, are believed to betray a later origin than is assigned to them by their contents, their mode of representation, and the character of the language; so that, in truth, we possess nothing which, in its original shape, reaches further back than the above-mentioned age. Such being the case, we must recognize not only the internal arrangement, but a good deal also of the contents of the Hebrew writings, as a later elaboration. That criticism has discovered, as it believes, here and there traces of much later hands than those to whom tradition ascribes the authorship of the particular works, does not necessarily always throw discredit on the incidents narrated, nor destroy the value of that peculiar spirit by which they are characterized.

The composition of the extant works in *Hebrew literature* proper would, on this view, extend over a period of nearly 900 years—viz., from the times of David to those of the Maccabees. This period was preceded by a preparatory one of sagas, songs, fragmentary historical notices, inscriptions, laws, and probably also priestly registers. The nature and contents of the particular writings are determined by the changing fortunes of the people, who were at first strong and flourishing; then disrupted and weakened; then held in subjection by Assyrian, Egyptian, Babylonian, Persian, Greek, and Syrian rulers; and, finally, once more independent under native princes. Nevertheless, the prevalent idea—the basis, so to speak, of the whole Hebrew literature, looked at from the merely human point of view—is a passionate enthusiasm for independence and for the preservation of a nationality founded on their law and history; hence its patriotism is of a profoundly religious character. The law and the doctrine are the “word of God”; the Hebrews are the “people of God,” his “chosen people”; their fortunes are, in quite a special sense, “providences”; and their poetry has God or the nation for its constant theme. In a certain sense, therefore, as we might expect, all the productions of the Hebrew muse show a marked similarity to each other; still they can be arranged, according to form and contents, under the five heads—law, prophecy, history, lyric poetry, and speculation. (For a special account of these, see the articles on the separate books of the Old Testament; also *BIBLE*, *PENTATEUCH*, etc.) The same epoch in which took place the transition from Hebraism to Judaism—the epoch of the captivity—was also that which marked the commencement of *Jewish literature*, properly so called. Founded on the earlier and more creative Hebrew, and for the most part written in the same language, it is yet qualified by the presence of religious conceptions borrowed from the Persians, of Greek wisdom, Roman law, and, at a later period, of Arabic poetry and philosophy, and of European science, though everything is strictly subordinated to the great ideas of the ancient faith. Since the return from exile, the Jewish—also, but erroneously, called the *rabbincical*—literature has, without the slightest external encouragement, actively taken part in the cultivation of the human mind; and in the results of this activity, which are still far from being duly appreciated, there lie concealed the richest treasures of centuries. Jewish literature has been divided chronologically into nine periods.

The first period extends to 143 b.c. After the return from exile, the Jewish people naturally enough became animated by an intense nationality of feeling; they had nearly lost name, country, life; and now that these were restored again, they strenuously resolved never more to place them in jeopardy. Guided by Ezra, the intellect of the nation began to exhibit surpassing reverence for the Pentateuch and the prophets. Expositions and additions to the earlier history (*midrashim*), as well as Greek translations,

were executed, and several of the hagiographa—such as particular psalms, the so called Proverbs of Solomon, Ecclesiastes, the books of Chronicles, portions of Ezra and Nehemiah—were written. To this period also, if to any, must belong the uncertain performances of the *great synagogue* (q.v.), a body the existence of which has, as indicated above, been doubted by some early critics, but which is now established beyond any doubt. To this the work of completing the canon of the Old Testament is chiefly ascribed. Towards its close (190–170 B.C.) several writers appear *in propriâ personâ*, as, for instance, Sirach and Aristobulus. The doctors of whom the great synagogue chiefly consisted were called *soferim* (scribes), and the Aramaic finally became the popular dialect of Palestine.

The second period extends from 143 B.C. to 135 A.D. The *Midrash* (q.v.), or the inquiry into the meaning of the sacred writings, was divided into *Halacha* (q.v.) and *Hagada*; the former considered the improvement of the law, with a view to practical results; the latter, the essence of the religious and historical interpretations. At first, both were the oral deliverances of the *soferim*, but gradually written memorials made their appearance. The public interpretation of the Scripture in schools and synagogues, the independence of the sanhedrim, the strife of sects, and the influences of Alexandrian culture, furthered this development. To this period also belong various Greek, but not, as is still erroneously supposed by some, the *written* targums or Aramaic versions of the Bible (see *TARGUMS*), which sprang at a much later period from oral translations of the Pentateuch in the synagogues instituted after the return from the exile; further the whole of the Apocrypha (q.v.), and the earliest Christian writings, which are at least the productions of men nurtured in the principles of Judaism, and which contain many traces of Judaistic culture, feeling, and faith. It was also characterized by the drawing up of prayers, scriptural expositions, songs, and collections of proverbs. The poet (not the prophet) Ezekiel, the author of the first book of the Maccabees, Jason, Josephus, Philo, Johannes (see above), are names specially worthy of mention; so also are the doctors of the oral law—Hillel (q.v.), Shamai, Jochanan-ben-Sacai, Gamaliel, Eleazar-ben-Hyrcan, Joshua-ben-Chananja, Ishmael, Akiba, and others of like eminence. *Rabbi* (master), *talmid chacham* (disciple of wisdom), were titles of honor given to those expert in a knowledge of the law. Besides the Maccabean coins, Greek and Latin inscriptions belonging to this period are extant.

The third period reaches from 135 to 475 A.D. Instruction in the Halacha and Hagada now became the principal employment of the flourishing schools in Galilee, Syria, Rome, and since 219 A.D. in Babylonia; the most distinguished men were the masters of the *Mishna* (q.v.) and the *Talmud* (q.v.)—viz., Eleazar-ben-Jacob, Jehuda, Jose, Meir, Simeon-ben-Jochai, Jehuda the Holy, Nathan, Chija, Rab, Samuel, Jochanan, Hunna, Rabba, Rava, Papa, Ashe, and Abina. Besides expositions, additions to Sirach, ethical treatises, stories, fables, and history were also composed: the prayers were enriched, the targum to the Pentateuch and the Prophets completed, and the calendar fixed by Hillel the second, 340 A.D. After the suppression of the academies in Palestine, those of Persia—viz., at Sura, Pumbeditha, and Nehardea—became the center of Jewish literary activity. On Sabbaths and festal days, the people heard, in the schools and places for prayer, instructive and edifying discourses. Of the biblical literature of the Greek Jews we have only fragments, such as those of the versions of Aquila and Symmachus. With this period terminates the age of direct tradition.

The fourth period (from 475 to 740 A.D.). By this time the Jews had long abandoned the use of the Hebrew, and instead had adopted the language of whatever country they happened to dwell in. During the 6th c. the Babylonian Talmud was concluded, the Palestinian Talmud having been redacted about a hundred years before. Little remains of the labors of Jewish physicians of the 7th c., or of the first *geonim* or presidents of the Babylonian schools, who first appear 589 A.D. On the other hand, from the 6th to the 8th c. the Masora was developed in Palestine (at Tiberias); and, besides a collection of the earlier haggadas (e.g., *Bereshith rabba*), independent commentaries were likewise executed, as the *Pesikta*; the *Pirke of Eliezer* (700 A.D.), etc. See *MIDRASH*; *HAGGADA*.

In the fifth period (from 740 to 1040 A.D.), the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus excited the emulation of the oriental Jews, among whom now sprung up physicians, astronomers, grammarians, commentators, and chroniclers. Religious and historical haggadas, books of morality, and expositions of the Talmud, were likewise composed. The oldest Talmudic compends belong to the age of Anan (*circa* 750 A.D.), the earliest writer of the Karaite Jews. The oldest prayer-book was drawn up about 880 A.D.; and the first Talmudic dictionary about 900 A.D. The most illustrious *geonim* of a later time were Saadia (d. 941 A.D.), equally famous as a commentator and translator of Scripture into Arabic, a doctor of law, a grammarian, theologian, and poet; Scherira (d. 998), and his son Hai (d. 1038), who was the author, among other things, of a dictionary. From Palestine came the completion of the Masora and of the vowel-system; numerous *midrashim*, the hagiographical targums, and the first writings on theological economy, were also executed there. From the 9th to the 11th c. Kairwan and Fez, in Africa, produced several celebrated Jewish doctors and authors. Learned rabbins are likewise found in Italy after the 8th c.—e.g., Julius

and Pavia, etc. Bari and Otranto were at this time the great seats of Jewish learning in Italy. After the suppression of the Babylonian academies (1040) Spain became the central seat of Jewish literature. To this period belong the oldest Hebrew codices, which go back to the 9th century. Hebrew rhyme is a product of the 8th, and modern Hebrew prosody of the 10th century.

The sixth period (from 1040 to 1204 A.D.) is the most splendid era of Jewish mediaeval literature. The Spanish Jews busied themselves about theology, exegesis, grammar, poetry, the science of law, astronomy, mathematics, philosophy, rhetoric, and medicine. They wrote sermons and ethical and historical works. The languages employed were Arabic, Rabbinical Hebrew, and ancient or classical Hebrew. We can only mention here the great doctor, Samuel Halevi (d. 1055), etc.; and lastly, the renowned *Maimonides* (q.v.), whose death closes this epoch. The literature of the French rabbins was more natural in its character, and kept more strictly within the limits of the halacha and haggada. In Provence, which combined the literary characteristics of France and Spain, there were celebrated Jewish academies at Lunel, Narbonne, and Nîmes, and we find Talmudists, such as Berahja Halevi, Abraham-ben-David, etc. The fame of the Talmudists of Germany, especially those of Mayence and Ratisbon, was very great. Among the most illustrious Jewish writers of this period, belonging to that country, are Simeon, the compiler of *Yalkut*, Joseph Kara, Petachja, etc. Only a few names belong to Greece and Asia; still the Karaite Jews had a very able writer in Juda Hadassi (1148). The greatest part of the feast-day prayers was completed before Maimonides. Many of the works, however, produced between 740 and the close of this period are lost.

The seventh period (from 1204 to 1492 A.D.) bears manifest traces of the influence exercised by Maimonides. Literary activity showed itself partly in the sphere of theologico-exegetic philosophy, partly in the elaboration of the national law. With the growth of a religious mysticism there also sprung up a war of opinions between Talmudists, Philosophers, and Cabalists. The most celebrated Jews of this period lived in Spain; later, in Portugal, Provence, and Italy. To Spain belongs (in the 13th c.) the poet Jehuda Charisi, etc. In the 15th c. a decline is noticeable. Books written in Hebrew were first printed in Spain, at Ixar in Aragon (1485), at Zamora (1487), and at Lisbon (1489).—During this epoch the chief ornaments of Jewish literature in Provence were Moses-ben-Abraham, David Kimchi, Jeruham, Farissol, Isaac Nathan, the author of the Hebrew Concordance.—In Italy Jewish scholars employed themselves with the translation of Arabic and Latin works. Works of an aesthetical character were written by Immanuel-ben-Solomon, the author of the first Hebrew sonnets; Moses de Rieti, who wrote a Hebrew *Divina Commedia*, etc.—While France could show only a few notable authors, such as the collectors of the *Tosafot*, Moses de Coucy, and Jehiel-ben-Joseph, the poet and exegete Berachja, Germany produced a multitude of writers on the law, such as Eleazar Halevi, Meyer from Rothenburg, Asher, Isserlin, Lippmann. The most of the extant Hebrew MSS. belong to this period; but a great part of mediaeval Jewish literature lies unprinted in Rome, Florence, Parma, Turin, Paris, Oxford, Leyden, Vienna, and Munich.

The eighth period (1492 to 1755 A.D.) is not marked by much creative or spiritual force among the Jews. In Italy and the east (1492), in Germany and Poland (1550), in Holland (1620), Jewish scholars worked printing-presses, while numerous authors wrote in Hebrew, Latin, Spanish, Portuguese, Italian, and Judeo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers, grammarians, etc., of this period were Isaac Abravanel, Elia Misrachi, I. Arama, J. Chabib, Eli Levita, O' dio Seforno, Joseph Cohen, Gedalja Jahia, Sal. Usque, Asaria de Rossi, David de Pomi, David Gans, Isaac Troki, I. Luria, J. Karo, M. Alschech, M. Jafe, J. Heller, J. Aboab, Manasse b. Israel, Dav. Comforde, Leo de Modena, B. Musaphia, J. Eybeschütz, D. Oppenheimer, J. Emden, M. C. Luzzatto, etc.

The ninth period extends from 1755 A.D. to the present time. Encouraged by the spirit of the 18th c. Moses Mendelssohn (q.v.) opened, to his coreligionists, a new era, which, as in the middle ages, first manifested itself in the national literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and literature have been earnestly cultivated. The sacred books have been translated by them into the languages of modern Europe, and foreign works into Hebrew; and many of this once proscribed and detested race have taken an important part in the public and scientific life of Europe. Among the many illustrious names of this last period we can select only a few, like Ezechiel Landau, Elia Wilna, J. Berlin, Mendelssohn, Mainon, Bendavid, Mendez, Beer, Euchel, Bensev, S. Dubno, Creizenach, Zunz, Jost, Geiger, Rappoport, Dukes, Zedner, Fürst, Sachs, Steinschneider, Munk, Salvador, Reggio, etc.—chiefly cultivators of literature, with reference to their own creed and nationality.

To enumerate names of those who were and are illustrious in general literature, in law, philosophy, medicine, philology, mathematics, belles-lettres, etc., we cannot even attempt, since there is not one country in Europe which does not count Jews among the foremost and most brilliant representatives of its intellectual progress. Of Germany—considered to be in vanguard of European learning—Bunsen says that the greater part of the professors at its universities and academies are Jews or of Jewish origin—(Nean-

der, Gans, Banary, Weil, Benfey, Stahl, Dardberg, Valentin, Lazarus, Herz, etc.)—certainly a most startling fact. Another extraordinary and well-authenticated fact is, that the European press, no less than European finance, which means the freest development of all the resources of soil and science for the gigantic enterprises of our day, are to a great extent in their power; while, on the other hand, names like Heinrich Heine, B. Börne, R. v. Ense, Berthold Auerbach, Henrik Herz, Jules Janin; Felix Mendelssohn-Bartholdy, Halévy, Meyerbeer, Moscheles, Joachim, Ernst, Rubinstein, Wieniawski, Grisi, Brahain, Giuglini, Czillag, Costa; Rachel, Davison, Rott, Dessoir; Bendemann, etc., besides hosts of others less familiar to English ears, who shine in all branches of art, music, sculpture, painting, the drama, etc., show plainly how unjust is the reproach of their being an “abstract” people, without sense for the bright side of life and the arts that embellish it. Briefly, they are, by the unanimous verdict of the historians and philosophers of our times, reckoned among the chief promoters of the development of humanity and civilization. What has been their reward we have seen. Terrible has been the punishment for sins and shortcomings, real or imaginary, over which both Christians and Mohammedans have thought good, at different periods, to constitute themselves judges; and the most hideous spot in the history of the last 2,000 years is the systematical but futile endeavor to sweep the “chosen race” from the face of the earth. “If there is a gradation in sufferings, Israel has reached the highest acme; if the long duration of sufferings, and the patience with which they are borne, ennable, the Jews defy the high-born of all countries; if a literature is called rich which contains a few classical dramas, what place deserves a tragedy lasting a millennium and a half, composed and enacted by the heroes themselves?” With these grand words of Zunz (*Synagogale Poesie*) we conclude our brief sketch, proudly pointing to the final triumph of humanity which belongs to our own day and generation.

JEWS, in point of law, are now, if natural-born subjects, on nearly the same footing as English subjects, the following peculiarities only being noticeable. By the 8 and 9 Vict. c. 52 they were allowed to hold offices in municipal corporations, on condition of signing a declaration (in place of the usual oaths) not to exercise their influence so as to injure or weaken the Protestant church. By the act 34 and 35 Vict. c. 48, they are placed, as regards their schools and places of worship, of education and charities, on the same footing as Protestant dissenters. Before 1845 doubts had prevailed whether the marriages previously celebrated in England among the Jews, according to their own usages, were valid, and the statute 10 and 11 Vict. c. 58 put an end to such doubts, by declaring all such marriages valid, provided both the parties married had been persons professing the Jewish religion. But now, as then, though it is competent for Jews, like other dissenters, to superadd any religious ceremony they please to their marriages, there must in all cases be notice given to the registrar of the district of such marriage being about to take place, the only exemption being that the marriage may be celebrated in the synagogue, and not, as in the ordinary case, in the superintendent registrar's office, or a registered building. A license may also be procured from the superintendent registrar; and the secretaries of the respective synagogues are recognized as the persons to keep the register books of the Jewish marriages. In Scotland there is no peculiar legislation affecting Jewish marriages. Lastly, by the statute 31 and 32 Vict. c. 72, which substituted one oath for the oaths of allegiance, supremacy, and abjuration, an extension of the 8 and 9 Vict. c. 52 was made, to suit the case of the Jews in all cases where the declaration set forth by 9 Geo. IV. c. 17 required to be taken. The result is that not merely as regards municipal offices, but all other offices where the same declaration is required, a Jewish subject is entitled to be admitted with a declaration or without any oath. Moreover, the complete emancipation of the Jews may be said to have been attained by the statute 21 and 22 Vict. c. 49, which enables either house of Parliament, when a Jew would be entitled, but for the oath of allegiance, to sit and vote in the house, to modify that oath by omitting the words, “and I make this declaration upon the true faith of a Christian.” When these words are omitted a Jew has no longer any conscientious objection to take the oath, and so is practically admitted, like other subjects, to become a member of either house of parliament. It is, however, still in the discretion of either house to refuse to make the resolution to omit those words, so that Jews have not an absolute right to admission, though practically it is not likely that the admission will in future be refused, at least by the house of commons. The same act specially excludes Jews from holding or exercising the office of guardians and justices of the United Kingdom, or of regent of the United Kingdom, or of lord high chancellor, lord keeper or lord commissioner of the great seal of Great Britain or Ireland, or the office of lord lieutenant or deputy, or other chief governor or governors of Ireland, or her majesty's high commissioner to the general assembly of the church of Scotland. Whenever a Jew holds any office in the gift of her majesty, to which office shall belong any right of presentation to any ecclesiastical benefice, such right of presentation shall devolve upon the archbishop of Canterbury for the time being.

JEWSBURY, GERALDINE ENDOR; b. England, 1821; sister of Maria Jane; a writer of novels and children's books. Among her works are *Zoe: the History of two Lives*; *The Half-Sisters*; *Marian Withers*; *Constance Herbert*, etc. Her writings have been favorably reviewed by *Blackwood* and the *London Examiner*.

JEWSBURY, MARIA JANE, 1800-33; b. England; contributed articles to the London *Athenaeum* and other periodicals, and wrote a number of miscellaneous works, including the following: *Phantasmagoria, or Sketches of Life and Literature*; *Letters to the Young*; *Lays of Leisure Hours*; and *Three Histories*. Christopher North commended Miss Jewsbury in *Noctes Ambrosiana*. In 1833 she was married to the rev. William Fletcher, a missionary, whom she accompanied to India. On her arrival at Bombay she fell a victim to the epidemic of cholera then raging.

JEW'S EAR, *Exidium auricula Judæ*, a fungus, one of the *hymenomycetes*, which grows on decaying parts of living trees, particularly elders. It is a native of Britain. In size and form it bears some resemblance to a human ear. It is soft but cartilaginous, wrinkled, and generally brown. It is stemless. The spores are produced on the upper surface. The under surface is fibrous and downy. Jew's ear was formerly in repute as a topical discutient and astringent. It may be kept long in a dried state. It is still sold in the shops, but *polyporus versicolor* is often substituted for it. The genuine Jew's ear, after being dried, swells when immersed in water; the *polyporus* does not.

JEWS-HARP (Fr. *jeu*, a toy?), a very simple musical instrument, made of metal. When played on, it is held between the teeth, and the sound is produced by the inhaling and ejecting of the air from the lungs, while at the same time an elastic tongue or spring, which is fixed in the middle of the frame, is set into vibration by being twatched by the finger. It is a pretty old invention, and is mentioned by Prätorius in his *Organographia*, in 1619, under the name of *crembalum*. The best Jews-harps are made in Riva, a town in the Italian Tyrol. The first performer of any celebrity on the Jews-harp was a Prussian soldier, under Frederick the great, called Koch. In modern times Kunert, Amstein, and others, were famous for using a variety of harps, all differently tuned; and their performances were so wonderful, that, like other artists, they traveled over Europe, and appeared at public concerts with great success.

JEWS' MALLOW. See CORCHORUS.

JEWS' THORN. See JUJUBE and PALIURUS.

JEYPOOR, one of the 19 native states of Rajpootana, India, anciently known as *Amber*; 150 m. long, 140 m. broad; 15,251 sq.m.; pop. 494,598. With the exception of some insulated peaks and clusters of hills in the n. and north-western parts, the surface is level. The population is composed of various races, the most numerous being the Minas, supposed to be the aboriginal inhabitants. The next, about equal in number, are the Jats, who are extensive landholders and skillful agriculturists. The Brahmins are more numerous in proportion to the population than in any other part of Rajpootana. The ruling class are the Rajpoots, who, though less numerous than the Minas and Jats, are able to muster 30,000 fighting men. The less important tribes are the Banias, Dhakurs, and Gujurs. The revenue, exclusive of the possessions of the feudal chiefs, is estimated at £458,395. By treaty this country became tributary to the East India company in 1818. In 1842 a large arrear of tribute, which had accumulated, was remitted, and the annual tribute fixed at £40,000. In consequence of intrigue and corruption in the administration a British force was sent to Jeypoor in 1855 to redress existing wrongs, which resulted in restoring order and securing the collection of the revenue. The prince having been poisoned, a regency was appointed during the minority of his successor, and the government was administered with justice and efficiency. The young prince having been initiated into public business, the British authorities, recognizing his fitness for the duties of his station, committed to him in 1851, when 18 years of age, the reins of government. Jeypoor, the capital of the country, is 850 m. n.w. from Calcutta; lat. $26^{\circ} 56'$, long. $75^{\circ} 55'$.

JEYPOOR', capital of the protected state of the same name, and perhaps the handsomest and most regularly built of the native towns of India, stands about 850 m. to the n.w. of Calcutta, in lat. $26^{\circ} 56'$ n., and long. $75^{\circ} 55'$ east. The place is a rectangle of two miles by one, being subdivided by parallel streets in both directions into small rectangular blocks, the palace and gardens occupying the center. There are numerous temples and mosques, an arsenal, an observatory, and an English and oriental school, with a medical school.—The state of Jeypoor is in Rajpootana; area 15,251 sq.m.; pop. 2,000,000.

JEZÉBEL, daughter of Ethbael, king of Tyre and Sidon, and wife of Ahab, king of Israel. Through her influence over her husband she induced him to permit the worship of her country's idols, and finally to depart entirely from the worship of Jehovah. A woman of force and much shrewdness, combined with unscrupulousness, she succeeded in withdrawing the Israelites from the true religion, until, it is related, that there remained but 7,000 of them who had not swerved. After the death of Ahab she maintained the same control over her son Jehoram, who was at last killed by Jehu, who then commanded the death of Jezébel, and she was flung from the window of the palace to the ground beneath, where the dogs devoured her.

JEZIRAH, or **BOOK OF CREATION**, one of the cabalistic books of the Jews containing a mystical account of the creation of the universe. It is divided into six chapters, which are subdivided into sections. The age of this work is unknown. The Jews claim it to be of divine origin, intrusted by the Lord to Abram, and by him handed down to

the learned rabbi Akiba. The conclusion of modern scholars is that it was composed by the Jewish schools of Egypt in the time of Philo Judæus about a century B.C. The Jezirah has been published, with five commentaries (1562), with a Latin translation and notes (1642), and with a German translation and notes (1830).

JEZREEL, a t. of Issachar, which contained a palace of the kings of Israel; deserted by the court after the death of Jezébel. In the time of Eusebius and Jerome it was known under the names of Esdraela and Stradela. In the history of the crusades we meet with it as Parvum Gerinum, the Zerin of the Arabs. Under the latter designation the town stands on a rocky declivity, between the mountains of Gilboa and Hermon, but contains only about 20 ruined huts and a few inhabitants. The original city, in the plain of Esraelon, is described as having been very beautiful, and the palace erected by Ahab as a marvel of architecture.

JHAN'SI, a fortified t. in Bundelcund, in the North-West Provinces, in lat. $25^{\circ} 28'$ n., long. $78^{\circ} 38'$ east. It carries on a considerable trade, being on the main route between the Deccan and the Doab. During the revolt of 1857 the native garrison murdered all the Europeans, men, women, and children, not leaving one to tell the tale. In the following April the place was recovered, with enormous loss on the part of the insurgents, by a detachment of the Bombay army under sir Hugh Rose.—The *district* of Jhansi has an area of 1567 sq.m. (pop. 317,826); the *division*, of 5,067 sq.m. (pop. 934,934).

JHE'LUM, the ancient Hydaspes, one of the rivers of the Punjab. It rises in Cashmere, which forms its upper basin, and is navigable within that country for about 70 miles. On emerging from the Himalayas through the Baramula pass, it again becomes practicable for small craft. After a course of 490 m. it joins the Chenab, in lat. $31^{\circ} 10'$ n., long. $72^{\circ} 9'$ e., and forms with it what is sometimes called the Trimah or Trimab. The banks of this river were the scene of the battle between Alexander the great and Porus. The river waters the towns of Islamabad, Shahabad, Srinagar, Jelalpur, and Pind Dadun Khan.

JHYLUM, JELUM, or BEHUT. See **JHELUM, ante.**

JIB, a triangular sail borne in front of the foremast in all vessels. It has the bowsprit for a base in schooners and vessels of a smaller class, and the jib-boom in larger vessels, and exerts an important effect, when the wind is a-beam, in throwing the ship's head to leeward. The flying-jib has the flying jib-boom for a base. When a fore-course is not used an additional jib-shaped sail, called the foresail, is spread on the fore-stay.

JIB-BOOM, an extension of the bowsprit of a ship towards the front, running out beyond it, by a cap and irons, as does the topmast above the lowermast. It gives greater spread for jib-sails, and a more extended base for the top-gallant-mast-stay. In large vessels a flying jib-boom is run out in a similar manner beyond the jib-boom.

JIBING. See **GYBING.**

JID'DAH, or JEDDAH, a trading t. of the Hedjaz, Arabia, is situated on an eminence rising from the eastern shore of the Red sea, about 60 m. w. of Mecca, of which city it is the port. Jiddah is an unhealthy town; it suffers greatly from want of water, and is surrounded by a desert. It has, however, long been the great commercial center of Arabia. It imports corn, rice, butter, and other natural productions from Egypt and Abyssinia, manufactures from India, and slaves from the Malay archipelago. Coffee is largely exported. It is inhabited by a fanatical population, and its religious enthusiasm is never allowed to wane, owing to the numbers of pilgrims to Mecca who are constantly pouring through it. On June 15, 1858, the inhabitants rose against the Christians resident among them, and massacred a considerable number of them. In Aug. of the same year, the town was bombarded by the British, and satisfaction rendered. The pop. fluctuates between 10,000 and 20,000 and upwards.

JIG. See **GIGG.**

JIGGER. See **CHIGOE.**

JIGGER, on board ship, an apparatus consisting of a strong rope with a block at one end, and a sheave at the other, used in maintaining the tension of—or, technically, in “holding on” to—the cable as it is thrown off from the capstan or windlass, round which it only takes two or three turns.

JIHUN'. See **OXUS.**

JIKA'DAZE, or SHIKATZE, a t. of Thibet, capital of the district Zang, on the right bank of the Zangbo, 190 m. w. of Lassa. Pop. estimated at 100,000.

JIME'NA, or XIMENA, a t. of Spain, in the province and 50 m. e. of Cadiz, on the e. declivity of the Sierra de Gazules. The town is regularly built, the streets steep, but clean. There are several churches and schools, a prison, town-house, etc. There are manufactures of leather, linen, earthenware, etc., and a trade in fruit and wine. Pop. 5,878.

JI'NA. See **JAINAS.**

JINN, supernatural characters occurring in the Arabian mythology, and supposed to be the children of fire. They were said to be under the government of a race of kings named Suleyman, to one of whom was ascribed the honor of having built the pyramids. There were both good and evil jinns, the one class hideously ugly in appearance, the other beautiful. They were supposed to have the power of manifesting themselves to human beings in the form of serpents, dogs, or other creatures, or of appearing in the guise of human beings, or of becoming invisible at pleasure.

JIONPOOR, or JOANPORE, a district of Hindustan, in the North-West Provinces, between 26° and 27° n. lat.; bounded n. by Oude, n.e. by Azimghur, e. by Ghazepoor, s. by Benares and Allahabad; 1552 sq.m.; pop. 798,503. It is well watered, extremely fertile, under good cultivation, and covered with forests. The inhabitants are Hindus and Mohammedans, the former greatly preponderating. With one tribe of the Hindus female infanticide prevailed until abolished by the influence of the British government. The district came into the possession of the British in 1775, and forms part of the Benares zemindary.

JIONPOOR, or JOANPORE, a t. in a district of the same name in the North-West Provinces of Hindustan. It was anciently the capital of an independent principality. It is on the river Goomty, 42 m. from Benares, 147 m. from Lucknow. Sultan Feroz III. of Delhi, having ordered a Hindu temple to be demolished, erected in 1370 around its ruins a fort of solid stone, which he named after his uncle and predecessor Joana. He sent numerous artificers and others to inhabit the new city, which was completed in twelve years. Khuaje Jehan, who became emperor after the subversion of the empire of Delhi by Tamerlane, made Jionpoor the capital. He was succeeded in 1399 by his son Moharic Shah, who in a prosperous reign of 40 years greatly strengthened and improved the city and fortress, and Jionpoor became one of the most renowned cities of Hindustan for religion and learning. It was again annexed to the empire of Delhi in 1468. Many of the mosques and colleges built at that time still exist. The fortress was often taken in the wars between the Afghans and Moguls, and much dilapidated, but was thoroughly repaired about 1570 by the governor of Bengal. The famous bridge of Jionpoor, built 280 years ago, still stands, a monument of ancient splendor and architectural skill. In 1793 it was submerged during the rainy season without any damage from the current. The town around the fort has some brick houses and a large bazaar. Many ruins of tombs and mosques are found in the vicinity of the city. The Jamai Musjed is a very handsome mosque built of stone, and is in good condition.

JITOMIR', chief t. of the government of Volhynia, in European Russia, is situated on the river Teterev, an affluent of the Dnieper, in lat. 50° 15' n., long. 28° 40' e. Pop. '67, 87,640. Its foundation is traced back as far as the 10th c., and it was at one time an important stronghold against the invasions of the Cossacks. In 1648 it was nearly destroyed by the Cossack chief Khmelnitzky. In 1778 it was annexed to the Russian empire. The town carries on a trade in leather, wax, honey, and tallow, has two annual fairs, carries on iron and glass works, and extensive cloth manufactures.

JOAB, a nephew of king David, was a distinguished warrior in the days of Saul. David gave him command of his entire army. He was an utterly unscrupulous general, and when David tried to remove him from his position in favor of Amasa, he plunged his sword into the heart of the latter in the very act of embracing him. He joined Adonijah in his conspiracy, and was at last taken by Solomon, although he had sought refuge at the altar in the tabernacle, and was put to death.

JO'ACHIM, JOSEPH, an eminent Hungarian violinist, was b. in the neighborhood of Presburg in 1831, received his early instruction at Pesth under Szervawinsky, director of the orchestra at the theater there, and made his début in public at the age of seven. He afterwards became the pupil of Böhm at Vienna, and at Leipsic studied counterpoint under Hauptmann, and made the friendship of Mendelssohn. His first appearance in London was in 1844, when, though only in his 14th year, he was at once allowed to be one of the most distinguished of contemporary violinists. His performances at Vienna, Pesth, Paris, and London have since established for him the position of the first violinist of the day. In power and brilliancy of execution, and all the mechanical qualities of playing, he is little, if at all, behind Paganini. His works, which include overtures, Hebrew melodies and other songs, and compositions for the violin, are pervaded by the same tenderness and depth of musical feeling that characterize his playing. In 1869 Joachim became a member of the senate of the Berlin academy, and was appointed a director in the conservatory of music there. In 1877 Joachim received the degree of Mus. Doc. from the university of Oxford.

JO'ACHIM, THE PROPHET, 1130-1202; Abbot of Floris; b. Celico, Italy; a Cistercian monk, founder of the monastery of Floris. He was held in high repute even by popes and princes. His followers reverenced him as a prophet. He denounced severely the corruption of the Roman hierarchy, and sought to effect a reformation. Some of his views were peculiar. He taught that the Christian era would close in 1260, followed by a new era under another dispensation. His treatise called the *Everlasting Gospel*, in which he advocated this tenet, was condemned by the Lateran council in 1215, and again by the council of Arles in 1260, which pronounced all his followers heretics. In

the middle of the 13th c. he had many adherents called Joachimites. He wrote many works, predicting in some of them the downfall of the papacy. His life was written by Gregory di Lauro.

JO ACHIMSTHAL, a t. of Bohemia, near the frontier of Saxony, 69 m. w.n.w. from Prague. It is situated in a valley, on the Weseritz, a feeder of the Eger, which itself flows into the Elbe, near the eastern opening of a remarkable gorge or pass among the lofty Erzgebirge, and at an elevation of 2,366 ft. above the sea. The town has a strange antique appearance, and the Rathaus is a very remarkable building. Joachimsthal was formerly of greater importance than now, owing to its mines of silver, which are still wrought, but are not so productive as they once were. The produce of the silver mines of Joachimsthal in the 16th c. was, at an average, 21,897 marks. For about a century before 1852 the average produce was only 3,181 marks; and from 1852 to 1862 it was 3,232 marks. Silver mines have been wrought at Joachimsthal from a very remote period; one mine is 300 fathoms deep. The whole number of miners employed at Joachimsthal in the 16th c. was about 12,000, with 400 overseers and other officials, and 800 surveyors. Besides the silver obtained from the mines of this neighborhood it produces also lead, tin, and iron to a considerable amount. Joachimsthal is the seat of offices and courts of mines. Dollars (*thalers*) were first coined here, and hence their name (see DOLLAR). Goiter and cretinism are lamentably prevalent at Joachimsthal. Much coarse lace is made in the surrounding mountainous district. Pop. '69, 6,586.

JOAN, POPE, the name of a supposed female occupant of the papal chair in the 9th century. The popular story represents this singular personage as of English parentage; but, educated at Cologne, Rome, and ultimately Athens, in all which places in the assumed character of a man, and under the name of *Joannes Anglicus*, "John of England," she is alleged to have attained great distinction as a scholar. The narrative adds that having come in the end to Rome, she had ability and adroitness enough to carry the deception so far as to obtain holy orders, and to rise through various gradations to the papal sovereignty itself; but that being nevertheless of immoral life, the fraud was at length discovered, to the infinite scandal of the church, by her becoming pregnant, and being seized with the pains of childbirth on occasion of a public procession. The story had obtained currency, certainly in the latter part of the 13th century. It was inserted, though discredited, by Platina in his *Lives of the Popes*, but the statement does not appear to have been much discussed until the 16th c., when the commentator of Platina, Panvinius, inserted a note in refutation of it. Later Roman Catholic historians of course have published replies to the objections against the papal succession which their adversaries drew from the story of the female pope; but it is curious that the most complete and elaborate investigation of the question was that of a Calvinist divine, Blondel, who demonstrated the historical groundlessness of the story. He was followed on the same side by Leibnitz; and although attempts have been made from time to time by a few writers to maintain the tale, it has been all but universally discarded, its latest patron being prof. Kist of Leyden, who, but a few years since, devoted an elaborate essay, *Verhandeling over de Pausin Joanna*, to the subject. A few words will suffice to explain the state of the historical evidence. The place assigned to the supposed papess is between the historical popes Leo IV. and Benedict III., the latter of whom died Mar. 10, 858. It is alleged that the Joan of the story occupied the papal chair for two years and five months. Now, according to all the chroniclers, with the doubtful exception of Marianus Scotus, Leo IV. did not die till July 10, 855, so that the interval between his death and that of Nicholas I., the successor of Benedict III., would be entirely filled up by the two years and five months of the papess, and no room would be left for the undoubted pontificate (of two and a half years) of Benedict III. Further, Hincmar of Rheims, a contemporary, in his 26th letter to Nicholas I., states that Benedict III. succeeded Leo IV. immediately. It is proved, moreover, by the unquestionable evidence of a diploma still preserved, and of a contemporary coin which Garampi has published, that Benedict III. was actually reigning before the death of the emperor Lothaire, which occurred towards the close of 855. The earliest authorities for the story of pope Joan, not reckoning a more than doubtful MS. of Marianus Scotus, are Martinus Polonus, a writer of the latter part of the 12th c., and a writer named Stephen de Bourbon, who wrote about 1225.—See Gieseler's *Kirchengeschichte*, th. ii. b. ii. s. 5; Wensing's *Over de Pausin Johanna* (Hague, 1845); Döllinger's *Papstfabeln des Mittelalters* (Munich, 1863); and Bianchi Giovini's *Esame Critico degli atti relativi alla Papessa Giovanna* (Milan, 1845).

JO'ANES, VICENTE, 1523-1579; b. Spain: studied in Rome and settled in Valencia, where he founded a new school of painters. He was one of the most distinguished Spanish painters of his time. His subjects were exclusively religious, and many of his works are in the churches and convents of Valencia. His great pieces are "Baptism of Christ," in the cathedral of Valencia; 6 pictures of the "Life of St. Stephen," in the palace of Madrid; and the "Holy Supper," in the Louvre.

JOANNA I., 1327-1382; Queen of Naples; daughter of Charles, duke of Calabria, and granddaughter of Robert of Anjou; was married in 1334 to her second cousin, Andrew of Hungary, who in 1345 was murdered by conspirators instigated, as was believed, by Joanna. His brother, Louis the great of Hungary, invaded Naples to avenge his death,

and she fled to Avignon, the residence of the popes; but on the mediation of the pope she was restored to the throne in 1352. In the schism between the popes Clement VII. and Urban VI. she took sides with Clement, when, at the instigation of Urban, a rebellion occurred in Naples; she was captured by Charles Durazzo, imprisoned, and delivered to the king of Hungary, who had her put to death in 1382.

JOANNA II., 1370–1435; Queen of Naples, 1414–1435; a grandniece of Joanna I.; was married to William of Austria, and afterwards to Jacques de Bourbon count of La Marche. Her character was very dissolute, and her government disturbed by constant feuds and insurrections.

JOANNES, ISLAND OF. See MARAJO, *ante*.

JOAN OF ARC (Fr. JEANNE D'ARC), the MAID OF ORLEANS, was the daughter of respectable peasants, and was b. in 1412, in the village of Domremy, in the department of Vosges, France. She was taught, like other young women of her station in that age, to sew and to spin, but not to read and write. She was distinguished from other girls by her greater simplicity, modesty, industry, and piety. When about thirteen years of age she believed that she saw a flash of light, and heard an unearthly voice, which enjoined her to be modest, and to be diligent in her religious duties. The impression made upon her excitable mind by the national distresses of the time soon gave a new character to the revelations which she supposed herself to receive, and when fifteen years old she imagined that unearthly voices called her to go and fight for the dauphin. Her story was at first rejected, as that of an insane person; but she not only succeeded in making her way to the dauphin, but in persuading him of her heavenly mission. She assumed male attire and warlike equipments, and with a sword and a white banner she put herself at the head of the French troops, whom her example and the notion of her heavenly mission inspired with new enthusiasm. On April 29, 1429, she threw herself, with supplies of provisions, into Orleans, then closely besieged by the English, and from the 4th to the 8th of May made successful sallies upon the English, which resulted in their being compelled to raise the siege. After this important victory the national ardor of the French was rekindled to the utmost, and Joan became the dread of the previously triumphant English. She conducted the dauphin to Rheims, where he was crowned, July 17, 1429, and Joan, with many tears, saluted him as king. She now wished to return home, deeming her mission accomplished; but Charles importuned her to remain with his army, to which she consented. Now, however, because she no longer heard any unearthly voice, she began to have fearful forebodings. She continued to accompany the French army, and was present in many conflicts, till, on May 24, 1430, she threw herself, with a few troops, into Compiègne, which the Burgundian forces besieged; and being driven back by them in a sally, was taken prisoner and sold by the Burgundian officer to the English for a sum of 16,000 francs. Being conveyed to Rouen, the head-quarters of the English, she was brought before the spiritual tribunal of the bishop of Beauvais as a sorceress and heretic; and after a long trial, accompanied with many shameful circumstances, she was condemned to be burned to death. She recanted her alleged errors at the stake, and expressed penitence, in the hope of having her punishment commuted into perpetual imprisonment. But this did not accord with the views of those in whose power she now was. Words which fell from her when subjected to great indignities, and her resumption of male attire when all articles of female dress were carefully removed from her, were made grounds of concluding that she had relapsed, and she was again brought to the stake, on May 30, 1431, and burned. Her family, who had been ennobled upon her account, obtained, in 1440, a revisal of her trial; and in 1456 she was formally pronounced to have been innocent.

Few facts in history seem better authenticated than the death of "the Maid" at Rouen in 1431, and yet grave doubts have been raised on the point. There was a popular belief at the time that some one had been executed in the place of Joan; and many pretended Maids appeared, who, however, were punished as impostors. But a father Vignier, in the 17th c., found among the archives of Metz a paper purporting to be written at the time, and giving an account of the arrival at Metz, on May 20, 1436, of the Maid Jeanne, who was at once recognized by her two brothers, and was subsequently married to a Sieur de Hermoise. Vignier afterwards found in the family muniment-chest of a M. des Armoise, in Lorraine, a contract of marriage between "Robert des Armoise, Knight, with Jeanne D'Arcy, surnamed the Maid of Orleans." In addition to this there was found, in 1740, among the archives of the Maison de Ville of Orleans, under the dates 1435–36, a record of certain payments to a messenger bringing letters from Jeanne the Maid, and also to her brother John du Lils or Lys. (De Lys was the name by which the family of D'Arc was ennobled.) A subsequent entry, Aug. 1, 1439, records a gift on the part of the council of the city for services rendered by her at the siege.—See Quicherat's *Condamnation et Réhabilitation de Jeanne d'Arc* (1850); Delepine's *Doute Historique* (1855); Wallon's *Jeanne d'Arc* (1867); Molandon's *Première Expédition de Jeanne d'Arc* (1874).

JO'ASH, or JEHO'ASII. King of Israel, son and successor of Jehoahaz and grandson of Jehu, reigned B.C. 838–823. He was a courageous and strong king, but adhered to the idolatry that had been introduced by Jeroboam.

JO'ASH, or JEHO'ASH, about B.C. 884-837; King of Judah, son of Ahaziah and Libnah of Beersheba. On the death of his father, his grandmother Athaliah having massacred his brothers and usurped the throne, he was secreted by his aunt Jehoshebath, the wife of Jehoiada the high-priest, and brought up by her in the chambers connected with the temple until his 8th year, when in a revolution Athaliah was slain, and Joash placed upon the throne. For several years, through the influence of the high-priest, he adhered to the worship of the true God; but after the death of Jehoiada, falling into idolatry, his kingdom was devastated by Hazael of Damascus, he was besieged in Jerusalem, and afterwards murdered in his bed by his servants, after a reign of forty years.

JOB [Heb. *Jyob*, derived by Gesenius from *ayab*, "to be an adversary;" hence (passive) "one who has an adversary," or "a persecuted one"], the leading personage in one of the canonical books of the Old Testament, which is called after him. He is said to have lived in the land of Uz (Sept. *Ausitis*, cf. Ptol. v. 19. 2), a locality somewhere between Idumea, Palestine, and the Euphrates. Whether Job was a real or a fictitious personage has been discussed with superfluous animation by critics. The Talmud (*Baba Bathra*, xv. 1) holds that "*Jjob never was, and never was created*, but is an allegory." The belief of most scholars at present is that the book of Job is a great dramatic poem, built on a basis of historical tradition. Job is a real person in precisely the same sense as the Hamlet of Shakespeare is a real person; i.e., for each there is a certain genuine groundwork of antique fact; but some of the incidents, together with the sentiments and speeches recorded, are purely imaginative. Who was the author, and when he lived, cannot be, or at any rate has not been, determined with exactitude. Some critics make him anterior to Moses; the LXX. identifies him with "Jobab, king of Edom" (postser. to Job); others, among whom are many of the Talmudical authorities, regard Moses himself as the author. The Mosaic period is claimed for it by Saadia, many of the church fathers, Michaelis, Jahn, Hufnagel, etc. A nearer approximation to what would seem to be the truth is the view held by Gregory Nazianzen, Luther, Döderlein, and others, who assign the work—which shows a certain affinity with the proverbs—to the age of Solomon, when Hebrew poetry was in its full bloom, and a broad catholic spirit pervaded the nation; some have even given Solomon himself the credit of its composition. The reference to the gold of Ophir seems at least conclusive against any hypothesis that would place its composition earlier; and while certain passages in Ezekiel, Jeremiah, Isaiah, Amos, which point to an acquaintance with it, go far to prove its comparatively early existence, Rénan, a recent French critic, considers that it belongs to the first half of the 8th c. B.C.; Ewald pronounces for a later period, and assigns the poem to the beginning of the 7th century. This date is also advocated by Dr. Samuel Davidson in his *Introduction to the Old Testament* (Lond. 1862). Others, again—among whom Clericus, Grotius, Gesenius, Umbreit, Knobel, De Wette, etc.—place it in the period of the exile; Hartmann, Vatke, Reier, and others, in the 5th Christian century.

The earlier German scholars, Herder, Eichhorn, etc., looked upon the author as an Edomite—not a Hebrew at all; but this view is now generally, if not entirely, abandoned. The poem is a genuine product of the Hebrew muse, not, however, standing on narrow national ground—the very scene being laid in a foreign country—but on the broad ground of a universal humanity: it is the attempt of a Hebrew thinker, of enlarged mind, to vindicate the divine government of the world.

Our space will not allow us to enter minutely into a consideration of the design of the poem, or to discuss the various theories which have been advanced. According to Dr. Davidson, it was "to demonstrate the insufficiency of the current doctrine of compensation." It condemns the notion that there is a *necessary* connection between sin and suffering, and without explaining the *cause* of the latter in the case of a good man, displays the most sublime trust in the wisdom of the divine Providence. It exhibits a noble spirituality; and in several places the mysterious contradictions of life seem to awaken in the soul of the writer thoughts of another life beyond the grave, in which God will vindicate the righteousness of His ways. As a work both of genius and art it occupies well-nigh the first rank in Hebrew literature, and is unsurpassed in sublimity of imaginative thought by any poem of antiquity. The language is elaborate and artificial in the highest degree, yet grandly simple withal, betokening not a primitive period in Jewish history, but one highly advanced. The dramatic construction of the poem indicates the same thing. It has a prologue and epilogue; the dialogues are arranged into three series, or, as they may be termed, *acts*; each of these, again, consists of three speeches by Job's friends, with three replies by Job himself, which, by a little stretch of fancy, we may describe as separate *scenes*. The poem (properly so called) opens and closes with a monologue by the author of the piece. The different character of the persons introduced is skillfully observed; their words have a rhythmic flow; and the dialogues are even strophically divided (see Ewald, *Das Buch Jjob übersetzt und erklärt, Zweite Auflage*, 1854). The integrity of the poem in its present form has been strongly questioned by many critics; the inferiority (in a literary and poetic point of view) of the passages containing the speeches of Elihu (xxxii.-xxxvii.), no less than the nature of the prologue and epilogue, are thought to indicate that these passages are the work of a later hand. Compare the commentaries of Schultens, Bertram, Eichhorn, Rosenmüller,

Ewald (with translation), Umbreit, De Wette, Hirzel, Stickel, Schlottmann, Rénan (with an admirable translation into French), Lee, Dillmann, etc.

JOB, Book of (*ante*), is generally regarded as one of the most ancient in the world. An examination of it reveals several facts tending to the probability that it was written between the deluge and the calling of Abraham. 1. As it contains an earnest discussion concerning the method of God's moral government over men in this life, it seems probable that all the great facts, bearing on the question, which were known to have occurred would be adduced by some one or other of the speakers, on one side or other of the argument. The deluge, as one of such facts, is referred to. "Hast thou marked the old way which wicked men have trodden, who were cut down out of time, whose foundation was overflowed by a flood?" But there is no reference to the history of Israel in Canaan, the journey through the wilderness, the judgments on Egypt, or the destruction of the cities of the plain. Why such facts were not employed in such a discussion seems difficult to explain, except on the theory that the book was written before they occurred. 2. The only form of idolatry referred to in the book is the worship of the sun and moon, generally regarded as among the earliest forms of idolatry. 3. The mode of divine worship practiced by Job was the patriarchal, in which the father of the family was the priest, as Noah and Abraham were. This fact implies the great antiquity of the book, but does not decide whether it was written before or after Abraham. 4. The reason assigned for the trial to which Job was subjected appears much more forcible on the supposition that it was made at an early period of the world, when there had been few opportunities to decide the question by an appeal to observation and experience. 5. The book contains an unusual number of words of an Arabic cast. This, in the judgment of some, points to an early origin when the connection between Hebrew and Arabic was closer than at a later period. By others this inference is not allowed.

Against the theory that the book was written before Abraham, the tribal names of Job's friends may be urged. Eliphaz was a Temanite, and Bildad a Shuite. As Esau had a grandson Teman and Abraham a son Shua, if Job's friends were descendants from them a date later than Abraham and Esau must be assigned to the book. But it is possible that there were men of the same names who lived nearer the flood. Job, it is said, was of the land of Uz. As a duke or chief of Edom, contemporary with Esau, had a grandson Uz, it might be inferred that the land received its name from him, and consequently that Job lived after Esau. But from earlier records it appears that Abraham had a nephew and Shem a grandson of the same name, so that the land may have been called after even the earlier of them. A similar possibility exists with regard to the other names. The Chaldeans and the Sabeans also are mentioned, but the origin of both may be traced back near to the flood.

The introduction and conclusion of the book contain brief narratives in prose, but the discussion which occupies the chief part of it is a poem of very high order both in sentiment and style. I. The introduction narrates Job's piety, wealth, and care for the religious welfare of his children. Satan, having insinuated that his piety was prompted by worldly motives, was allowed to try him; first by taking from him his property and children, and afterwards by inflicting on him severe physical suffering. All this he endured for a time without falling into sin. Three of his friends coming to condole with him, rent their garments when they saw him, wept over him, and sat down in silence seven days. At length driven, by the continuance of his severe trials, to the utterance of maledictions against the day of his birth, he ended also the silence of his friends. II. Eliphaz begins the discussion mildly, and with regret that he feels compelled to speak. Reminding Job of his wise and encouraging counsel to others in their afflictions, he expresses surprise that he sinks down under his own sorrows. He asserts that the righteous are never given up to suffering, but that, while the incorrigible are overwhelmed, God punishes also those whose uprightness is imperfect though sincere. He therefore exhorts Job to submit to the calamities which have come on him as the just punishment of his sins, and to hope that, through the mercy of God, all will yet be well with him. Job in reply avers that he has sufficient reason to complain, that his afflictions are too heavy to be borne, and that he wishes for death from the hand of God as the only relief. He complains of his friends as heartless in condemning him; compares them to a deceitful brook which mocks the thirsty traveler; reminds them that he has not sought their sympathy or help, yet assures them that if they have any just considerations to present he will patiently hear them. He then turns from them to God, lamenting the vanity and weariness of his condition, imploring relief, giving vent to the bitterness of his soul and asking that God will let him alone, will accept his confession, and forgive his sins. Bildad next speaks, roughly assuming that Job's children have been cut off because of their sins, and that Job himself, if he be upright and will seek the Lord, may have his sorrows turned to joy. Job replies that he admits all that has been said concerning the just government of God, but that men are too imperfect to merit his favor and too weak to endure his stroke. Yet, according to the comparative goodness which they can attain, he asserts his righteousness, and complains that God, judging him according to his own infinite holiness, treats him as a sinner notwithstanding all his efforts to do right. Again he bitterly laments his birth, and calls on God to let him alone for a little while that he may have some rest before he goes down to the grave.

Zophar makes the third attack on Job, calling his defense senseless and false, telling him that his afflictions, overwhelming as they are, are less than his iniquity deserves; that if he will humble his heart, forsake his sins, and call on God, he may yet be restored to prosperity and peace; but that if he continue impenitent all hope of deliverance will be vain. As all the three friends have now spoken, Job replies, in cutting language, to them all, saying, "No doubt but ye are the people, and wisdom shall die with you." Yet he affirms that his knowledge is not inferior to theirs; yea, that they have uttered only commonplace things which everybody knows. Appealing to the air, the land, and the sea as full of the works of God, whose supremacy he acknowledges over all the affairs of mankind, and declaring his own readiness to submit his case to him, he charges his friends with having made false statements in their pretense of zeal for the divine government, and professes his determination to continue his trust in God even unto death. Then, addressing himself directly to God, he pleads with him to withdraw his hand from him and not to overwhelm him with his mighty power, as a tempest that puts forth its strength in crushing the dry stubble or a driven leaf. After this he closes his reply with a beautiful lamentation over the frailty of life. 2. The second division of the discussion Eliphaz, as before, begins. He charges Job with vanity, presumption, prayerlessness, arrogance, and craft. He vindicates the government of God, which, he declares, deals with the wicked according to their character, sending on them disquietude of spirit in the midst of external safety, ruin in the hour of prosperity, and destruction when they think themselves strong. Job's reply condemns his friends severely as miserable comforters, complains irreverently against God as giving him up into the hands of the wicked, and breaking him with breach upon breach. He also asserts passionately his innocence, to which, he says, earth and heaven will both bear witness. Bildad's second address is increasingly severe on Job, treating all his arguments as vain and arrogant attacks on the government of God, and denouncing on him the terrible calamities which, he says, are manifestly the portion of the wicked. Job's answer to this cruel speech is from the depths of a sorrowful yet subdued spirit. He calls on his friends to remember that God has overthrown him, has shut up and darkened his path, has removed the crown from his head, and surrounded him with destruction; so that his brethren, kinsfolk and friends, his servants, and even his wife count him as a stranger, and little children despise him. Then with a pathetic appeal for human pity because God's hand is upon him, he passes the crisis of his distress, and springs up to a sublime confidence in God which pours the light of redemption on the scene. Conscious of the importance of what he is about to say, he looks eagerly around for some way of preserving it. "Who will write the words that now I speak? Who will engrave them on a tablet and cut them into the rock forever? For I know that my redeemer liveth, and at the latter day will stand upon the earth. Though this will be after they have destroyed even my skin, yet, delivered from the flesh, shall I see God. I shall behold him on my side; mine eyes shall see him, and he will not be a stranger to me, even though my reins within me are consumed." 3. From this point the discussion becomes easier to understand. Job's friends, adhering to their theory that God deals with men in accordance with their characters, charge on him iniquity of conduct and of heart, which, they insist, must be as aggravated as his afflictions are great: while he, turning increasingly away from man, confesses the majesty, sovereignty, and justice of God; gives a grand description of wisdom as consisting in fearing the Lord and departing from evil; asserts his integrity in God's sight, and declares that if he will pronounce judgment in his case he will bind it as a crown of righteousness on his head. At length, the three friends having been silenced, a fourth takes up the argument—Elihu, the youngest of the company, who has listened in silence but with growing impatience to all that has been said. Displeased with his companions because they have not answered Job aright, and with Job because he has maintained his own righteousness, he calls on all to listen to him. While he agrees with much that has been advanced concerning the punishment of sinners in this life, he asserts, as a principle in God's government which none of the disputants have made prominent, that affliction is often sent on men for their profit that they may be turned from their evil purposes and humbled in their pride. The debate is closed by the Lord himself, answering Job out of the whirlwind and drawing from him the humble confession, "Behold I am vile: I have heard of thee by the hearing of the ear, but now mine eye seeth thee; wherefore I abhor myself and repent in dust and ashes." III. After this the condemnation of his three friends was pronounced; and Job having prayed for them, his own captivity was turned, and the Lord blessed the latter portion of his life more than he had its beginning.

JOBERT DE LAMBALLE, ANTOINE JOSEPH, 1799-1867; b. Lamballe; an eminent surgeon of Paris, surgeon at the hospital of St. Louis in 1830, and surgeon to the emperor in 1854. He was insane in the latter part of his life. His principal works are *Traité Théorique et Pratique des Maladies Chirurgicales du Canal Intestinal*, two vols.; *Traité de Chirurgie Plastique*; and *Traitemenit des Fistules resico ruginales*. For the first of these he received 2,000 francs from the French institute, of which he was a member.

JOB'S TEARS, *Coix lachryma*, a corn-plant of India. It is a grass, sometimes rising to the height of 8 ft., with the stont habit of maize, to which also it is botanically allied; but the male and female flowers grow close together in spikelets,

which are produced in axillary clusters. The name is derived from the tear-like form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets and necklaces, and are also an article of food. This plant is cultivated to some extent in many parts of India, but it is one of the worst of the cereals. It has become almost naturalized in Spain and Portugal, and flour made from it is there used, but it is chiefly a resource of the poor in times of scarcity.

JO DAVIESS, a n.w. co. of Illinois, bounded n. by Wisconsin, and s.w. by the Mississippi, which separates it from Iowa; 650 sq.m.: pop. '70, 27,820. Surface irregular and well watered; soil fertile. Chief products are wheat, maize, oats, wool, and hay. Mines of lead are numerous, and copper is found. The articles of manufacture are carriages, agricultural implements, saddlery, and machinery. There are some flour-mills and breweries. Co. seat, Galena.

JODELLE, ETIENNE, 1532-1573; b. Paris; a dramatic poet, distinguished for his efforts to substitute the institutions of the Greek drama and choruses for the *mysteries* and *moralities* then in vogue under the patronage of the church. His tragedies, *Cleopâtre Captive* and *Didon*, and his comedy, *Eugène ou Rencontre*, were very successful. He excelled also as an orator, painter, and sculptor.

JODELN, a peculiar manner of singing with the falsetto voice in harmonic progressions, which exists only among the Tyrolese and the Swiss.

JO'EL (Jehovah is God), the son of Pethuel, one of the twelve minor prophets, who delivered his predictions, according to some, in the days of Joash; others, however, place him variously, in the time of Hezekiah, Manasseh, Josiah, Uzziah, &c. Concerning the circumstances of his life absolutely nothing is known. The occasion of his prophecy was an extraordinary plague of locusts, accompanied by an extreme drought, which consumed the land. After describing these judgments the prophet calls upon his countrymen to repent, and assures them that God is ready to forgive. Extraordinary warmth and tenderness of feeling, together with an enthusiastic belief in the glory of the future destiny of the people, run through the whole of the book. Some of the passages have been understood by theologians as predictive of the blessings of the Messianic age, and one is actually applied by the apostle Peter to the events which transpired on the day of Pentecost (Acts ii. 16-21). The style of Joel, always vivid and eloquent, sometimes sublime, is perhaps the very finest of any of the Old Testament writers. One of the most elaborate works on Joel is Credner's *Der Prophet Joel*. Compare Ewald, Umbreit, Henderson, &c.

JOEL, PROPHECY OF (*ante*), one of the earliest of the prophetic books, contains a series of general predictions which later prophets give more definitely. It consists of four parts: I. An announcement of devastation inflicted on the land by hosts of locusts and worms. Some interpret this as a literal description of destruction caused by these plagues of the field. Others regard it as an emblem of invasions by great armies of men led by Assyrian and Babylonian kings; or, with still wider range, by the Assyrians and Chaldeans, the Medes and Persians, Alexander, and the Romans. II. A call on the people for repentance and contrition of heart, to be manifested by fasting, solemn assemblies, and mourning; accompanied with an assurance that their transgressions should be forgiven and prosperity restored. III. A prediction of Messianic blessings that would characterize the last days. The fulfillment of this—beginning at the day of Pentecost (Acts ii. 16), which was followed not many years after by the destruction of the Jewish dispensation—is still advancing in the world's history. IV. A prediction of judgments on the adversaries of God's people, among whom Tyre, Sidon, other nations on the coast of Palestine, Egypt, and Edom, are mentioned, perhaps as representatives of all; with promises of final and perpetual blessings on Judah and Jerusalem.

JOE MILLER'S JESTS, or the Wit's VADE-MECUM, a well-known collection of facetiae, first published in 1739. A great proportion of the good things which this book contained appears to have been the product of the period immediately preceding its publication. They are more often humorous than witty, and they seem to have been all the more popular on account of a profusion of coarseness and indecency, such as the taste of the present age could not endure. A second edition of the *Jests* was called for in the year of the first publication; they came to a fourth edition in the following year; and the work, growing in size at every fresh appearance, had reached its 14th edition by 1760. Innumerable issues of it, or of works founded upon it, bearing the same or similar titles, have since been published in England and America. It has, in many cases, been modified more or less, to suit the growing nicety of the public—with detriment, it must be said, to the quality of its humor; and, indeed, it would almost seem as if humor flourished upon obscenity as flowers do upon manure. A lithographic facsimile of the first edition, which is now exceedingly rare—there is no copy in the British museum—was published in 1861. The exact title was as follows: “*Joe Miller's Jests, or the Wit's Vade-mecum; being a Collection of the most Brilliant Jests, the Politest Repartees, the most Elegant Bons-mots, and most Pleasant Short Stories in the English Language. First carefully collected in the company, and many of them transcribed from the Mouth of the Facetious Gentleman whose name they bear; and now set forth and*

published by his Lamentable Friend and Former Companion, Elijah Jenkins, Esq.; most humbly inscribed to those Choice Spirits of the Age, Captain Bodens, Mr. Alexander Pope, Mr. Professor Lacy, Mr. Orator Henley, and Job Baker, the Kettle-drummer. London, T. Read, Dogwell Court, Whitefriars, Fleet Street, 1739."

The Joe Miller whose name has been handed down in connection with this compilation of jests was Joseph Miller, an eminent comic actor, reputed among the tavern-hunters of his time as a fellow of infinite humor. He was born, it is believed, in London, in 1684; he died in London in 1738, and was buried in the churchyard of St. Clement Danes in the Strand, where there is a tombstone erected to his memory, bearing an epitaph by Stephen Duck. He was a great favorite with the public, and is said to have contributed by his acting to the popularity of Congreve's plays. Ben in *Love for Love*, sir Joseph Wittol in the *Old Bachelor*, and Teague in the *Committee*, were the characters in which he was most successful; his portrait was painted in the last two of these. The compiler of the *Jests* was John Mottley, an author of no great reputation, who is said to have amused himself by writing down or dictating them at a time when he was laid up with the gout. Mottley was the son of a col. Mottley, who, having been high in favor with James II., followed James into exile, got a command in the service of Louis XIV., and was killed at the battle of Turin in 1708. Col. Mottley had married before the revolution a Gloucestershire lady of considerable fortune. His wife—her family being zealous for the revolution—refused to accompany him to St. Germain. Three of four years later he made a stay of considerable length in England upon a secret commission from James; and his son, the compiler of the *Jests*, was born in London, in 1692. Mottley was educated at St. Martin's library school in London; and, through the influence of viscount Howe, who was a connection of his mother, he got, at the age of 16, a place in the excise office. This place he lost in 1720, apparently through some involvement in the bubble speculations of that year; and afterwards, though he had promises both from lord Halifax and from sir Robert Walpole, he never succeeded in obtaining an office. He had to live by his wits, and he produced five or six plays—the first of them named the *Imperial Captive*—which met with some success. He seems to have owed not a little to the patronage he received from people of fashion and from the court. In 1739, the year in which he produced *Joe Miller's Jests*, he also published a life of the great czar Peter, in 3 vols. 8vo. This work was published by subscription, and had the support of the royal family, and of a great number of the nobility and gentry. He followed it up in 1744 with the *History of the Life and Reign of the Empress Catharine of Russia*, 2 vols. 8vo. These works were mere compilations from the journals and other publications of the time; but with the lapse of time they have acquired some value, through the scarcity or disappearance of the authorities upon which they were founded. Mottley died Oct. 3, 1750.

JOGGLE, in masonry, is a notch or curve in the joints, adopted in fitting stones together, so as to prevent them from slipping. Fig. 1 is a common form.

FIG. 1.

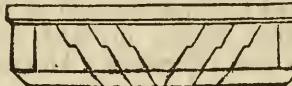

FIG. 2.

The joggle-joint is commonly used in straight arches for this purpose, as in fig. 2. Joggles are also used where very tight joints are required to resist water, etc. Sometimes the joggle consists of a piece of hard stone let into a groove cut in both the stones forming the joint.

JOGIIS. See YOGA, and YOGIN, *ante*.

JOHANNA, one of the Comoro islands (q.v.).

JOGUES, ISAAC, 1607-46; b. Orleans, France; was ordained in Paris, and sent to Canada as a Jesuit missionary in 1636. After laboring several years among the Huron Indians, he established a mission at Sault St. Marie among some Algonquin tribes. With a party of Hurons he went to Quebec for supplies for the mission, and returning, they fell into an ambuscade, nearly all his companions were killed or taken, and he was made a slave and treated with great cruelty. Escaping to the Dutch at Albany and thence to New Amsterdam, he was kindly received by governor Kieft, and sent to Europe. Returning from France to Canada he confirmed a treaty of peace between the French and Mohawks in 1646, and founded a mission with that tribe, but was killed at Caughnawaga on suspicion of sorcery. An account of his captivity in Latin, of the tomahawking of René Goupil at his side, and a description of New Netherlands, with his letters were published by the New York historical society.

JOGUES, or YUGS, divisions of time in the fabulous chronology of the Hindus; as the suttee yug, tirtah yug, dwapaar yug, etc., each supposed to have covered some millions of years, and to have included a period of purity, degeneracy, or corruption, as the case might be.

JOHANNES SECUNDUS, 1511-36; b. at the Hague. His true name was Jan Everard. He had some reputation as a sculptor and painter, but excelled chiefly as a poet. He accompanied Charles V. on his expedition to Tunis. He was a man of genius and learning. His poems are admired for their classical purity, and have been trans-

lated into nearly all the principal European languages. His *Opera Poetica* were published by his brothers in 1851.

JOHAN'NISBERGER. See GERMAN WINES.

JOHANNOT, CHARLES HENRI ALFRED, 1800-37; b. Hesse-Darmstadt; educated at Paris, and distinguished himself by his engravings and paintings. His two most celebrated pictures are "Mademoiselle de Montpensier" and "The Battle of Brattelan." "The Shipwreck of Don Juan," and "Cinq Mars," obtained for him several commissions from Louis Philippe.

JOHN, the name of a long line of popes, the number of whom is variously stated by different historians, owing to some uncertainty as to the designation of two of the popes in the series—John VIII. (872-82), who is styled the IX. by some writers, who, accepting the story of pope Joan (q.v.), reckon her as John VIII.; and John XV. (985-96), who is also called XVI. by those who place before him another John who died within a few days of his election. Without entering into this question, it will suffice to say that the last of the line of popes called John is John XXIII. The following appear to deserve some special notice.—JOHN XII. was the son of Alberico, and grandson of the notorious Marozia, who, during the pontificate of John X. (913-27), ruled with almost supreme power at Rome. John was originally named Octavianus, and on the death of pope Agapitus in 956, being elected pope through the lawless intrigue or violence of the dominant party, when only in his 19th year, was the first in the papal line to originate the now familiar practice of changing his name. His life, according to accounts which it is impossible to discredit, was what might be expected from such antecedents, scandalous and disorderly; and although he had crowned Otho emperor and king of Italy in 962, that monarch in 963, in a synod of the clergy, overstepping all the ordinary rules of canonical procedure and legal precedent, caused sentence of deposition for scandalous life to be pronounced against John, and Leo VIII. to be elected in his stead. John, however, re-entered Rome in the following year with a strong party, and drove out Leo; but his career was cut short by a dishonorable death. He was killed, according to Luitprand, while prosecuting an unlawful intrigue in 964. In his effeminacy or licentiousness, Panvinius and other historians find the origin of the fable of pope Joan.—JOHN XXII. is one of the most celebrated of the popes of Avignon. His family name was James de Cahors, and he was elected pope in 1316, on the death of Clement V. Attempting to carry out, in very altered circumstances, the vast and comprehensive policy of Gregory VII. and Innocent III., John interposed his authority in the contest for the imperial crown between Louis of Bavaria and Frederick of Austria, by not only espousing the cause of the latter, but even excommunicating his rival. The public opinion, however, and the political relations of the papacy founded upon it had already begun to change. The diet of Frankfort refused to obey, and a long contest ensued, not only in Germany, but also in Italy, where the Guelph or papal party was represented by Robert, king of Naples, Frederick of Sicily being the chief leader of the Ghibellines. The latter was placed by John under the same ban which had already been proclaimed against Louis; but in 1327 Louis came to Italy in person, and having been crowned at Milan with the iron crown, advanced upon Rome, expelled the papal legate, and was crowned emperor in the church of St. Peter's by two Lombard bishops. Immediately on his coronation he proceeded to hold an assembly, in which he caused the pope, under his original name of James de Cahors, to be thrice summoned to answer a charge of heresy and breach of fealty; after which he caused him to be deposed, and Peter de Corvara, a monk, to be elected pope, under the name of Nicholas V. These measures, however, were attended with little result. Louis returned to Germany, and the Guelphic predominance at Rome was restored, the papal representative resuming his authority. But John XXII. never personally visited Rome, having died at Avignon in 1334, when, although without incurring the suspicion of personal aggrandizement, he had accumulated in the papal treasury the enormous sum of 18,000,000 florins of gold. This pope is remarkable in theological history as the author of that portion of the canon law called the *Extravagantes*, and also as having held the singular opinion, that the just will not be admitted to the beatific vision until after the general resurrection. This opinion he formally retracted before his death.

JOHN (ante), the name of twenty-three popes.—I., a Tuscan, who followed Hormisdas in the papal chair, in 523. He was employed by king Theodoric on a special mission to Constantinople, in which he would appear to have been unsuccessful, as on his return he was cast into prison, where he died, after having been pope only three years.—II. succeeded Boniface II. about 533, after an election on the part of the clergy and people of Rome. Died 535.—III. succeeded Pelagius I. in 560, receiving his confirmation from the emperor Justinian, at the hands of the exarch of Ravenna. His occupancy of the papal see was made noteworthy by the occurrence of his conflict with the French clergy, who refused to recognize his authority. He died in 573.—IV., born in Dalmatia, became pontiff on the death of Severinus in 640. The emperor Heraclius having issued an edict in defense of the Monothelites, a schismatic sect, John assembled a council in Rome which condemned both the heresy and its defender. His death occurred in 642.—V., born at Antioch in Syria, and succeeded Benedict II. in 685; died in Aug. 687.—VI., born in Greece; succeeded to the papal throne in 701. Certain charges

having been brought by the English clergy against Wilfred, archbishop of York, John called a council at Rome, which acquitted him. This pope died in 705.—VII., a Greek, who succeeded John VI., but only lived two years.—VIII., born in Rome, and succeeded Adrian II. in 872, devoted himself to extending the limits of the papal power, but was greatly thwarted by frequent incursions of the Saracens into Italy. He died by assassination in 882.—IX., born at Tibur (Tivoli), in Italy, and was raised from a convent of Benedictines to be pope in 898. He died two years later.—X. (Giovanni Cenci) succeeded to the chair in 914, and displayed great courage and force of character. He commanded in person a victorious movement of his armies against the Saracens, but becoming the victim of plots and intrigues on the part of the duke of Tuscany and his wife, was, by their orders, thrown into prison, and afterwards murdered, in 928.—XI. (Giovanni Conti), the natural son of the infamous Marosia, wife of the duke of Tuscany, already mentioned. The two were seized by Alberico, another son of Marosia, and were imprisoned together in the castle of Saint Angelo. John succeeded Stephen VIII. in 931, and was himself succeeded by Leo VII. in 936.—XII. (Ottaviano Conti) was the son of Alberico, and was elected pope when only eighteen years of age, and assumed the name Octavianus, being the first pope to adopt this custom. His licentiousness and his many crimes caused him to be summoned before a council called by Otho I., the first German emperor, and whom John had crowned. By this council he was condemned and deposed in 963. The following year he succeeded in partially reinstating himself, but fell suddenly ill, and died in 964.—XIII. was bishop of Narni, and was elected to the papacy on the demise of Benedict V. in 965, with the approval of the emperor Otho. A revolution broke out in Rome against this pope, which resulted in his capture and imprisonment. He was sustained by Otho, who marched on Rome, defeated the insurgents, and after hanging thirteen of their leaders, restored John to his position. The latter died in 972.—XIV. (Peter), bishop of Pavia, became pope about 984, succeeding Benedict VII. He retained the pontificate only nine months, when he was overthrown by Boniface VII., who procured his imprisonment, and finally his assassination, which took place in prison.—XV. succeeded John XIV. in 985, but died a few days after his election.—XVI. was elected in 985, and continued to occupy the holy see until his death, which occurred in 996.—XVII. (Philagathus), a Roman by birth, who became pope in 997, through the influence of the consul Crescentius, who deposed Gregory V. in his favor. The latter was, however, restored by the aid of Otho III., and John was murdered.—XVIII. (Sicco), an Italian of noble birth, who died a few months after assuming the pontifical title.—XIX. (Phasianus) became pope in 1003, but retired to a monastery six years later.—XX. (Romanus), son of one of the counts of Tuscany (Gregory), and succeeded his brother, Benedict VIII., in 1024. He died ten years later.—XXI. (Pedro), a native of Lisbon, succeeded Adrian V. in 1276, but only survived his election a few months.—XXII. (Jacques d'Euse, or James of Ossa), was elected to succeed Clement V. in 1316. At this period the feud of the Guelphs and the Ghibellines was disturbing Italy, and John espoused the cause of the former. The families of Visconti, Colonna, and other well-known names were among the leaders of the Ghibellines, who fought under the banner of Louis, king of Bavaria, afterwards crowned emperor in St. Peter's. While John held court at Avignon, a monk of Abruzzo, named Peter de Corvara, was made pope by Louis, under the name of Nicholas V. There were thus a pope at Avignon and another pope at Rome. John died at the former place in 1334, without having succeeded in relieving Italy from her warlike condition.—XXIII. (Cardinal Cossa), a Neapolitan, who succeeded Alexander V. in 1410. He held a disputed title, his rivals being Benedict XIII. and Gregory XII. His morals were loose, and his miserly nature made him many and powerful enemies. Having quarreled with Ladislaus, king of Naples, the latter roused the people of Rome against him, and procured his expulsion. Having appealed to the council of Constance, he was required to abdicate, was imprisoned for three years, and died in 1419.

JOHN, THE APOSTLE AND EVANGELIST, was the son of Zebedee, a fisherman of the sea of Galilee, and of Salome. He was b. at Bethsaida, and, till he was called by Jesus to be his disciple, seems to have followed his father's occupation. The events of his life, from this time to the ascension of Christ, are to be learned from the gospels. After the outpouring of the Spirit on the day of pentecost, he appears to have labored for the spread of the Gospel first in Jerusalem and Samaria, and afterwards to have had his residence chiefly in Ephesus. During the reign of the emperor Domitian he was driven by persecution to the isle of Patmos, but returned to Ephesus under Nerva, and died there at a great age. The dates assigned to this event range from 89 to 120 A.D., and in any case he must have long survived his brother apostles. It is believed that he was the only one of our Lord's apostles who died a natural death. Tradition accounts for this by representing his life as miraculously preserved. He is represented in Scripture as of a peculiarly affectionate nature, "the disciple whom Jesus loved;" and tradition makes his last words to have been, "Little children, love one another." The works attributed to him are the gospel, the three epistles of St. John, and the book of Revelation. The gospel was long regarded as indisputably the work of St. John, and so held to have been written not later than 78 A.D. But of late the Johannine authorship has been con-

fidently denied, especially by critics of the Tübingen school. These, headed by Baur (q.v.), regard the gospel as representing a theology that arose after the Pauline and Petrine schools had long divided the early church, and as being therefore a work of the middle of the second century. The author, they hold, was a Gentile, and his purpose in writing was rather dogmatical than historical. Of the epistles, it is almost certain that the first proceeded from the same writer who composed the gospel. In style, language, and doctrine, it is identical with it, and from the earliest times it was quoted as a work of the apostle John; but the second and third are classed by Eusebius among the *Antilegomena* (Scriptures of doubtful genuineness), and were suspected by the most learned and critical of the early fathers.—For an account of the book of Revelation, see REVELATION OF ST. JOHN.

JOHN, THE APOSTLE AND EVANGELIST (*ante*), was probably one of the two disciples of John the Baptist who, impressed with the witness of their master to Jesus of Nazareth, followed him and, having abode with him the rest of the day, were thenceforth numbered among his disciples. He and his brother James were called to be fishers of men in close connection with two other brethren, Simon and Andrew. When the twelve apostles were chosen, these four were placed at the head of the list. John and James received from Jesus the surname, "Boanerges," signifying sons of thunder. Through their mother, Salome, they sought from him what they considered, the two places in his kingdom that were nearest to himself. In a Samaritan village that would not receive him they asked, "Lord shall we command fire to come down from heaven and consume them?" At another time John said, "Master, we saw one casting out devils in thy name and we forbade him, because he followed not with us." John, Peter, and James were often specially trusted by their master. They only of the apostles were with him when he raised the daughter of Jairus, when he was transfigured on the holy mount, and when he entered on his conflict in the garden. Besides the frequent association of the three apostles, a still closer intimacy existed between John and Peter, recorded first, and perhaps beginning, when Jesus sent them together into Jerusalem to prepare the last passover. Afterwards, at the supper, they held confidential communication together in the effort to ascertain who was to be the traitor. When Jesus was arraigned before the great council, John, through his acquaintance with the high priest, in whose house the session was held, obtained admission for himself and Peter. They were together on the morning of the resurrection, when Mary Magdalene told them of the opened and empty sepulcher, and together they started immediately to see for themselves—John outrunning Peter, but Peter entering in before John. At the sea of Tiberias a special intimacy between them was shown when John, first of the company in recognizing the Lord, informed Peter personally of his discovery; and when Peter, having had the manner of his death intimated to him, inquired earnestly concerning John, "Lord, what shall this man do?" After the day of pentecost, they went together into the temple and were together in healing the lame man, in their imprisonment, and in their bold answer before the council. After the gospel had been preached in Samaria, they were sent together by the other apostles to direct and perfect the movement there. And they were still together in Jerusalem, accounted—with the second James—as pillars of the church, 17 years after the conversion of Paul. While John, from the beginning of Christ's ministry, was one of the chosen three and of the yet more favored two, he was also honored by an association with the Lord himself closer than any of the rest obtained. Not until the last passover is the distinction recorded; probably not until then was it manifested; perhaps the only outward sign of it was in the privilege given him of reclining with his head on the breast of Jesus, at that supper before which the apostles had disputed among themselves about the place that each should have in the expected kingdom. From that time he designates himself in his gospel as "the disciple whom Jesus loved." He only of the apostles stood by the cross, where he received from the Lord in his dying agony the precious charge of his mother, who was also standing by, that he might be to her as a son. After the martyrdom of Paul, John, according to the general testimony of the early Christians, resided at Ephesus, having an apostolic oversight of the churches in proconsular Asia.

JOHN, GOSPEL OF (JOHN, *ante*). I., was one of the books of the New Testament which were of standard authority in the council of Nice, 325 A.D., as possessed and acknowledged to be of apostolic origin by all the churches of Christendom. In this judgment both the parties, orthodox and Arian, of which the council was composed, were agreed. And the agreement was not disturbed by the fact that the great question in debate between them and in the churches—the proper divinity of Christ—brought this gospel into the center of the arena; so that if there had been any uncertainty respecting its genuineness the discussion would, inevitably, have made it appear. As an incidental result, therefore, that great council demonstrated the fact that, in the first quarter of the 4th c., the gospel of John was in universal use throughout the Christian church as his genuine and unquestioned work. This demonstration, in itself so clear, is confirmed by the individual testimony to the same effect given, outside of the council, by Eusebius, Athanasius, and Arius. II. About the same time the emperor Constantine made provision for building new churches and preparing new copies of the Scriptures,

in which John's gospel was included, to fill the place of those which, at the close of the 3d c., during the persecution under Diocletian, had been destroyed. It is therefore plain that, in the last quarter of the 3d c., this gospel was one of the books of Scripture in use throughout the Christian churches. III. Origen, whose life extended from 253 back to 184 A.D., was a diligent student and famous teacher of the Scriptures, as well as a great traveler among the churches. He visited almost all parts of Christendom, became acquainted with many presbyters and bishops, taught in many churches, drew students to Alexandria from all sections of the empire, took an active part in the controversies of his time, and wrote much in defense of the common Christian faith. Thus eminently qualified to be a witness for the whole church, he affirms that "the four gospels, the last of which is John's, are the only undisputed ones in the whole church of God throughout the world." This is testimony not only that Origen himself received the gospel of John as genuine, but also that, towards the beginning of the 3d c., all the churches of Christendom so received it. IV. Clement of Alexandria lived from 220 back to about 165 A.D., and, besides traveling extensively in Italy, Greece, Egypt, and Asia, was a great Christian teacher at Alexandria. Concerning the gospels he says that "those of Matthew and Luke were written first; then Mark's, and last of all, John's." His testimony establishes the fact that John's gospel was in use among the churches of Christendom during the last quarter of the 2d century. V. The oldest known treatise against Christianity was written by Celsus not far from 170 A.D. "He studied the Christian doctrines profoundly, drawing his information from the Scriptures. It is undeniable that he knew John's gospel. Indeed, Keim has proved that the image of Christ which he composed for himself is taken in great part from John's conception and presentation of him. The whole Christological attitude of the church, as Celsus describes it, is John's. It follows from this that John's gospel was at that time a record of Christianity known by friend and foe." VI. Tertullian, who lived from about 240 back to about 160 A.D., testifies that "not only among the apostolic churches, but also among all the churches which are united with them in Christian fellowship, the gospel of Luke has been maintained from its first publication; and the same authority of the apostolic churches will uphold the other gospels which we have, in due succession, through them, and according to their usage, I mean those of Matthew and John; although that which was published by Mark may also be maintained as Peter's, whose interpreter Mark was." VII. Irenaeus, whose life extended from 202 back to 126 A.D., says that "John's gospel was the last of the four, was published at Ephesus by the disciple of the Lord who leaned on his breast, and declares the Redeemer's primary and glorious generation from the Father, 'In the beginning was the Word.'" VIII. The Coptic versions of the New Testament, in use probably at the beginning of the 3d c., the old Latin, used still earlier in the province of Africa, and the Syriac, made not later than the earlier part of the 2d c., all contain the gospel of John. And as only previously acknowledged books of Scripture would be translated as such, these versions prove that the gospel of John was generally acknowledged as his work as far back as the earlier part of the 2d century. IX. An additional testimony, covering about the same period, is furnished by the Muratorian fragment, a part of a treatise on the books of the New Testament named from its discoverer, and assigned by critics to the latter half of the 2d century. It places John's gospel last among the four which were then universally received by the churches as of canonical authority. X. Justin Martyr was the author of a dialogue with Trypho the Jew in defense of Christianity, and of two defenses presented to the emperor and senate, the earliest of which was written between 138 and 147 A.D. In these writings, addressed to unbelievers, he quotes, as authority for his statements concerning the life and teaching of Christ, certain works which, without naming the particular authors, he calls "memoirs," "memoirs made by the apostles," "memoirs, made by the apostles, which are called gospels," and "memoirs composed by the apostles of Christ and their followers." Concerning the use made by Christians of these books he says: "On the day called Sunday all who live in cities or in the country assemble in one place, and the memoirs by the apostles, or the writings of the prophets, are read as long as time permits. When the reader has finished, the president admonishes and exhorts to the imitation of these good things." The question whether these memoirs were our four gospels has, in these last days, been strenuously debated. That they were seems clear, because our four gospels, as has been shown, were at a somewhat later period universally received and read in the churches on Sundays, as the memoirs of Christ written by apostles and their followers; viz., by Matthew and John, by Mark, the follower of Peter, and Luke, the follower of Paul: and there are no traces of any others having been so received and read. But it is impossible that in Justin Martyr's time one set of such memoirs could have been universally received and read in the churches, and in half a century later a rival or different set take their place, without great and multiform evidence being left of collision and substitution. But of any such process there is no trace whatever. That John's gospel was one of those to which Justin referred is also proved by his quotations from it and allusions to it; some of which are here given. (1) He refers to Christ as the Logos in terms which John alone uses: "the Logos was made flesh;" "through him God created all things;" "he was the only begotten of the Father of the universe, having been begotten by him in a peculiar manner as his logos and power." (2) He cites words of John the Baptist, part of which John's gospel alone gives—"I am not the

Christ, but the voice of one crying." (3) As a reason why Christians considered baptism obligatory, Justin says: "For Christ also said, 'Except ye be born again, ye shall in no wise enter into the kingdom of heaven.'" But in John's gospel only is such a saying of Christ recorded. And with this he makes an explicit reference to the objection which John also ascribes to Nicodemus concerning the impossibility of a man being born a second time. (4) He says: "The Jews are justly upbraided by Christ as 'knowing neither the Father nor the Son.'" (5) He says, "Christ healed those who were blind from their birth." XI. The Gnostics as well as their opponents generally received John's gospel during the controversies carried on 120-30, giving it very forced interpretations so as to make it appear consistent with their doctrines. This fact is decisive proof that at this early period, within about a quarter of a century of the time when the gospel was probably written, its genuineness was fully established. XII. At this point we must take into account the certain truth that Christianity and numerous Christian churches existed before any of the gospels were written. The apostles, among whom John was conspicuous from the beginning, first preached and taught orally, thus making converts and founding churches. In this way the churches generally had become well acquainted with the apostolic teaching, and were accurate judges of what professed to be in harmony with it, before the gospels appeared. This explains the fact that the publication of them produced no commotion and excited no feeling except satisfaction with having in permanent form that which was loved so much and known so well. It explains also the fact that within so short a time after John's gospel was written it was widely diffused and generally received. The transition from the spoken to the written excited no debate, and left no traces of its having been made, except the almost simultaneous presence of the book itself in all parts of Christendom.

The great design of John's gospel he has himself stated—"These are written that ye might believe that Jesus is the Christ, the Son of God; and that, believing, ye might have life through his name." In prosecution of this design, it (1) declares the existence, in the beginning, with God and as God, of the logos, who is the source of light and life, by whom all things were created; and who became flesh, dwelling among men, manifesting to chosen witnesses his glory in the fullness of grace and truth; (2) gives a statement of the mission of John the Baptist, and of his testimony to Jesus as the Messiah, the Lamb of God to take away sins, and the Son of God in whom all men are called on to believe; (3) makes prominent the portion of Christ's ministry which was fulfilled in Jerusalem—chiefly at the national feasts, yet clearly marks also his journeys to and from Galilee, where the larger portion of his work was performed; (4) records the faith of his first disciples in him as the promised Messiah; (5) gives an account of his first miracles in Galilee; of the symbolic cleansing of the temple with which his public ministry in Jerusalem began; of his interview with Nicodemus, to whom he declared the necessity of regeneration, the design of the atonement, and the love of God in sending his Son into the world; of his conversation with the woman of Samaria, to whom he proved his Messiahship by an omniscient judgment concerning herself, and made God known as the object of spiritual worship to be offered henceforth by all men everywhere; of his healing the man at Bethesda, followed by his claim of equality with God, and of power to give spiritual life, to raise all the dead, and to judge the world; of his feeding 5,000 men with five loaves; of his proclaiming himself as the bread of life, the living water, the light of the world, the giver of liberty, and the deliverer from death; of his bestowing sight on a man who had been born blind; of his announcing himself as the good shepherd, who, by laying down his life for his sheep, would give them eternal life; and of his raising Lazarus from the grave, followed by his triumphal entrance into Jerusalem. From this point the gospel gives the private communion of the Savior with the apostles at the last passover; his foretelling that Judas Iscariot would betray him, and Simon Peter deny him; his words of comfort, peace, and deliverance, followed by the promise to send the Holy Spirit as an advocate, instructor, and guide; his intercession with the Father in behalf of his disciples through all time; his apprehension and arraignment before the Jewish council and the Roman governor; his crucifixion, burial, and resurrection from the dead, interviews with his disciples, and final instructions to them. This gospel diffuses the glory of the Son of God over all his incarnate life upon earth. And as the culmination of the external proof of its genuineness is the book itself present in the churches through all the centuries since it was written, so the effulgence of the internal proof is the Divine being, character, and life exhibited through it all.

JOHN THE BAPTIST, the forerunner of Christ, was the son of the priest Zacharias and Elizabeth, the cousin of Mary, the mother of our Lord. John and Christ were therefore second cousins. The wonderful circumstances attending the conception and birth of the former are recorded in the 1st chapter of St. Luke's gospel. After a life devoted to preparing his countrymen for the coming of the Messiah, he was thrown into prison, and afterwards executed by Herod Antipas. John's followers existed as a separate body till long after the spread of Christianity, and a sect still exists in the east professing to be his disciples.—John the Baptist was, from an early date, regarded in England as the patron saint of the common people, and on this account, apparently, great masonic festivals are held on St. John's day, the day dedicated to him, which is the 24th of June.

JOHN THE BAPTIST, was of the priestly race by both parents, his father, Zecharias, being a priest of the course of Abia or Abijah (I. Chron. xxiv. 10), and his mother, Elizabeth, being of the daughters of Aaron (Luke i. 5). His coming as the precursor of the Christ was foretold centuries before his birth by Isaiah as the one crying in the wilderness, and by Malachi as the messenger to prepare the way before him. His birth was foretold by an angel, who announced also what his character and office would be as the forerunner of the Christ and the reformer of the nation. On the 8th day the child was brought, in conformity with the law of Moses, to the priest for circumcision. All that we know of John for 30 years, or from his birth to the beginning of his ministry, is contained in one verse—"The child grew and waxed strong in spirit, and was in the deserts till the day of his showing to Israel." John was ordained to be a Nazarite from his birth (Luke i. 15), drinking neither wine nor strong drink, implying that he should abstain from worldly pleasures, and live a life of self-denial. In accordance with this he retired to the wild and thinly peopled region west of the Dead sea, and, by self-discipline and communion with God, prepared himself for the work to which he had been appointed. When he came forth he was dressed in the costume of one of the old prophets, with a garment woven of camel's hair and fastened to the body by a leathern girdle. His food was such as was found in the desert—locusts and wild honey. Thus prepared, he began his ministry, calling upon the people to repent in order to share in the blessings of the kingdom of God, near at hand. Multitudes were attracted by his fervor, his reputation for extraordinary sanctity, and the prevailing belief that some great one was about to appear; and many of every class came forward to confess their sins and be baptized. His baptism was a visible token of that repentance which was essential to forgiveness, but he assured his hearers that One mightier than he would baptize with the Holy Ghost. John instructed his disciples also in moral and religious duties, as fasting and prayer. But soon after he had given his testimony to the Messiah his ministry was brought to a close. The king, Herod Antipas, was living in adultery with the wife of his brother Philip, and when John reproved him for his sin, Herod put him in prison. The prison was the castle of Machærus, a fortress on the eastern side of the Dead sea. Herodias, enraged at the rebuke of John, determined that he should die. At Machærus, which was the palace of Herod as well as a fortress, was held a court-festival in honor of the king's birthday. The daughter of Herodias danced before the company, and so delighted was Herod that he promised to give her whatever she should ask. Prompted by her mother, she asked for the head of John the Baptist. Instructed by Herod, an officer of the guard slew him in the prison. His death is supposed to have occurred just before the third passover in the course of our Lord's ministry, A.D. 28. Herod doubtless regarded him as an extraordinary person, for when he heard of the miracles of Christ he ascribed them to John, who, he said, had risen from the dead. John's disciples took the body of John and buried it, and ecclesiastical history records the honors paid to his memory. He is mentioned with great honor in the Koran under the name of Jahja.

JOHN, surnamed LACKLAND, king of England, and the youngest of the five sons of Henry II. by his wife, Eleanor of Guienne, was b. at Oxford, Dec. 24, 1166. His father having obtained a bull from the pope authorizing him to invest one of his sons with the lordship of Ireland, John was appointed in a council held at Oxford in 1178, and in Mar., 1185, he went over to take the reins of government, but governed so badly that he was recalled in the following December. John latterly united with his brothers in their rebellions against their father, and it was the sudden communication of the news of his having joined his brother Richard's rebellion that caused the death of Henry.

When Richard I succeeded to the crown, he conferred upon his young brother earldoms which amounted to nearly one-third of the kingdom. This did not, however, prevent John endeavoring to seize the crown during Richard's captivity in Austria. John was, however, pardoned, and treated with great clemency, and is said to have been nominated his successor by his brother on his death-bed. John hastened, at his brother's death, to obtain the support of the continental barons, and then started for England, and was crowned at Westminster, May 26, 1199. Arthur, the son of his elder brother Geoffrey, was lineally the rightful heir to the crown, but at this time the law of primogeniture was but imperfectly established. The claims of Arthur were supported by Anjou and the king of France, but John bought off the latter influence. John now obtained a divorce from his first wife, Hadwisa of Gloucester, and married Isabella of Angoulême. In the war which ensued Arthur, who was again assisted by France, was taken prisoner, and confined in the castle of Rouen, where there is every reason to believe that he was privately put to death; but the English monarch lost Normandy, Touraine, Maine, and Anjou.

John now quarreled with the pope, and the kingdom was placed under an interdict; while John, in return, confiscated the property of the clergy who obeyed the interdict, and banished the bishops. Otherwise, too, he displayed considerable activity. He compelled William, king of Scotland, who had joined his enemies, to do him homage (1209), put down rebellion in Ireland (1210), and subdued Llewellyn, the independent prince of Wales (1212). The pope now, in 1213, solemnly deposed John, and absolved his subjects from their allegiance, and commissioned Philippe Auguste to execute his sentence. John, denounced by the church, and hated for his cruelty and tyranny by

his subjects, found his position untenable, and was compelled to make abject submission to Rome, and hold his kingdom as a fief of the papacy. Philippe proceeded with his invasion scheme, though no longer approved by Rome; but the French fleet was totally defeated in the harbor of Damme, 300 of their vessels being captured, and above 100 destroyed. Subsequent events, however, proved more favorable to France, and at length the English barons saw the opportunity to end the tyranny of John: they drew up a petition, which was rejected by the king, and this was the signal for war. The army of the barons assembled at Stamford, and marched to London; they met the king at Runnymede, and on June 15, 1215, was signed the great charter (*Magna Charta*), the basis of the English constitution. The pope soon after annulled the charter, and the war broke out again. The barons now called over the dauphin of France to be their leader, and Louis landed at Sandwich, May 30, 1216. In attempting to cross the Wash John lost his regalia and treasures; was taken ill, and died at Newark castle, Oct. 19, 1216, in the 49th year of his age.

JOHN II., surnamed THE GOOD (Le Bon), 1319-64; King of France, the second of the Valois family; succeeded his father, Philip VI. of Valois, in 1350. He commenced his reign by acts of despotism and cruelty. England being appealed to by the friends of those whom he had slain, invaded France, when John was defeated by Edward the black prince at Poictiers in 1356, and carried to Bordeaux and then to London, where he was a prisoner for three years. His ransom, by a treaty with Edward III. at Bretigny, was the surrender to the English of eight of the best French provinces and the payment of 3,000,000 crowns in gold. He left his son, the duke of Anjou, in London as a hostage for the fulfillment of the treaty, who, having escaped in violation of his parole, John voluntarily returned as a prisoner in 1364 to London, where he suddenly died.

JOHN II. (CASIMIR), 1609-72; King of Poland; younger son of Sigismund III. Having embarked for Spain for the purpose of persuading Philip III. to form a league against France, he was shipwrecked, and imprisoned for two years at Vincennes. Being released on a promise given by his brother, king of Portugal, never to wage war against France, he traveled through western Europe, became a Jesuit, and was made cardinal by Innocent X. Returning to Poland he succeeded his brother Ladislas in 1648, and married his widow, Maria Luisa Gonzaga. During his reign Poland was attacked by Russia and Sweden, resulting in wars which terminated in the cession of several provinces on the Baltic and the Dnieper. His wife intriguing for the son of the prince of Condé as successor to the throne, and the nobles contending among themselves, he abdicated at the diet of Warsaw, Sept. 16, 1668, and retired to France, where he was kindly received by Louis XIV. When he died his heart was interred in St. Germain des Prés, and his body taken to the cathedral of Cracow in 1676.

JOHN III. (JOHN SOBIESKI), King of Poland, 1674-96; one of the greatest warriors of the 17th c.; was b. in 1624, or, according to others, in 1629, and educated with the utmost care, along with his brother Mark, by his father, James Sobieski, castellan of Cracow, a man of virtuous character and warlike spirit. The brothers traveled in France, England, Italy, and Germany. Their father's death recalled them home in 1648. The Poles were defeated by the Russians in the battle of Pilawiecz. The Sobieskis took up arms to restore the fortunes of their country. Mark fell in battle on the banks of the Bog; John distinguished himself by his valor, and became the adm'r of his countrymen and the dread of the Tartars and Cossacks. He received the highest military dignities and appointments, and on Nov. 11, 1673, defeated the Turks in the great battle of Choczim, in which they lost 28,000 men; after which he was, May 21, 1674, unanimously elected king of Poland, and was crowned in Cracow along with his wife, Maria Casimir Louisia, daughter of the marquis Lagrange d'Arquien, and widow of the woiwode John Zamoiski. When the Turks besieged Vienna in 1683 John hastened thither with 20,000 Poles, and, along with the German auxiliaries who had also come up, raised the siege by the victory of Sept. 12 of that year. In this battle he took the banner of Mohammed, which he sent to the pope. On his entrance into Vienna he was received with unbounded enthusiasm by the inhabitants. His subsequent undertakings against the Turks were not equally successful. He died of apoplexy June 17, 1696. John Sobieski was not only a statesman and warrior, but a lover of science, and a man of gentle disposition and agreeable manners; but his constant wars prevented that attention to the internal condition of Poland which its critical situation urgently required, and this oversight on his part helped to hasten the downfall of Poland.

JOHN I., JOAN "the Great," 1357-1433; King of Portugal; b. Lisbon; son of Peter I. At the death of his brother Ferdinand in 1383 he became regent, and seized the throne in violation of the rights of the infanta Beatrice. A war followed, resulting in favor of John. In 1415 he took Ceuta from the Moors. The islands of Madeira, cape Verde, the Azores, and the Canaries were discovered in his reign.

JOHN II., JOAN "the Perfect," 1455-95; King of Portugal; b. Lisbon; married in 1471 Leonora of Lancaster; succeeded his father, Alphonso V., Aug. 29, 1481. He put to death for conspiracy the dukes of Braganza and Viseo, 1483-84. During his reign B. Dias discovered the cape of Good Hope, Da Gama visited India, and the African coasts were explored by distinguished navigators.

JOHN IV., JOAN, 1604-56; King of Portugal; b. Villaviciosa; duke of Braganza; in 1640 expelled the Spanish usurpers and succeeded to the throne of Portugal. During his reign he was constantly at war with Spain.

JOHN VI., JOAN, 1767-1826; King of Portugal; b. Lisbon; in 1785 married Charlotte (Carlota), infanta of Spain; in 1788 received the title of prince of Brazil; in consequence of his mother's illness, governed the kingdom of Portugal in 1789; was regent in 1799; on the approach of the French army in 1807 removed his court to Brazil; became king on the death of his mother in 1816; returned to Portugal in 1821; recognized the independence of Brazil in 1825.

JOHN I., JUAN, 1358-90; King of Castile and Leon; b. Epila; succeeded to the throne on the death of his father, Henry II., in 1379, at the age of 21. To defeat the schemes of John of Gaunt, duke of Lancaster, who had assumed the title of king of Castile, and of Ferdinand of Portugal, he attacked Portugal for the purpose of placing his son on the throne of that kingdom, but was unsuccessful. He made peace by marrying Beatrice, 10 years of age, daughter and heiress of the king of Portugal. Ferdinand dying, John again made war upon Portugal in support of Beatrice against John I., king of that country, but failed on account of the prevalence of yellow-fever. Subsequently, the duke invading Castile, peace was made by the marriage of his daughter to prince Henry.

JOHN, BAPTIST JOSEPH FABIAN SEBASTIAN, Archduke of Austria, a distinguished Austrian prince and general, was born Jan. 20, 1782, and was the sixth son of the emperor Leopold II. His mother was the infanta Maria Louisa, daughter of Charles III. of Spain. He early gave proof of considerable talent for military affairs; and in 1800 he received the command of the defeated Austrian army, formerly under Kray. His military career was not brilliant. He was defeated at Hohenlinden in 1800, and at Austerlitz in 1805. In the war of 1809 he advanced with an Austrian army into Italy, defeated the viceroy Eugène at Sacile, and made his way as far as the Adige when the reverses of the Austrian forces at Landshut, Eckmühl, and Ratisbon compelled him to retire. His love of natural science, for which he manifested an early predilection, continued undiminished amidst all the vicissitudes of his life; and Austria is indebted to him for many valuable scientific institutions and enterprises. Living in political retirement, he showed a warm interest in every improvement and public work, and became exceedingly popular; so that when the German national congress assembled after the commotions of 1848, he was called by a great majority of voices, on June 29 of that year, to be vicar or regent of the Germanic empire. The fall of Metternich had also, in the mean time, released him from his political isolation in Austria; and the emperor Ferdinand had placed him at the head of affairs there, and intrusted to him the opening of a constitutional assembly in Vienna. In his high office as regent the archduke acted on strictly constitutional principles; but the progress of events being unfavorable to the Austrian interests, he resigned his office Dec. 20, 1849, and returned to Grätz, where he lived, as formerly, in retirement till his death, May 10, 1859.

His marriage was one of an unusually romantic kind. Late on a Jan. evening in 1827, he had occasion to require the services of the postmaster of Aussee, a mountain-village in the vicinity of Grätz. The postmaster was from home; but his daughter, Anna Plochel, volunteered to drive him over the hill to his destination. The conversation and spirit of this maiden seem to have charmed the archduke, and within three weeks he married her. The titles of countess of Meran and baroness of Brandhof were subsequently conferred upon this lady. See MORGANATIC MARRIAGE.

JOHN THE CONSTANT, 1467-1532; Elector of Saxony; succeeded his brother, Frederick the wise, in 1525. In alliance with Philip of Hesse and other states he zealously espoused the Protestant reformation, and caused the Augsburg confession to be proclaimed in the diet held in that city in 1530.

JOHN THE FEARLESS, 1371-1419; Duke of Burgundy; son of Philip the bold of France. At the age of 25 he joined the king of Hungary against the Turks, and was made prisoner at the battle of Nicopolis, but for the great courage which he had displayed the sultan Bajazet liberated him, and gave him the surname of the fearless. On his return to France he succeeded his father in 1404 as duke of Burgundy, but was opposed by the queen and the duke of Orleans, his rival. In 1407 he instigated the assassination of the duke, and soon obtained almost supreme power in the kingdom. This was followed by a civil war, in which John was aided by Henry IV. of England. In 1416 he formed a secret alliance with Henry V. of England, invaded France, and captured the king in 1418, but was treacherously murdered in 1419 at the instigation of the dauphin, son of Charles VI. He was succeeded by his son, Philip the good.

JOHN, FRANZ VON, Baron, b. Bruck, Lower Austria, 1815; was captain under field-marshall Radetzky in the Italian revolution of 1848, occupied important military positions, was appointed minister of war, and in 1874 was master of the ordnance and chief of staff of the whole army.

JOHN OF BEVERLEY. See BEVERLEY.

JOHN OF LEYDEN (properly, JOHN BOCKELSON or BOCKOLD) was b. at Leyden in 1510. He was the son of a bailiff in the Hague, and of a Westphalian bondwoman.

He wandered about for some time as a journeyman tailor, and then settled in Leyden, but was fonder of amusements than of his trade. He possessed some poetic genius, and was noted for his abilities as an actor. Adopting the opinions of the Anabaptists (q.v.), he became one of their wandering prophets. In 1533 he came to Münster, was the chief supporter of Matthiesen or Matthisys there, and when Matthiesen lost his life in 1534, became his successor. He set aside the ancient constitution of the city, set up in Münster "the kingdom of Zion," appointed judges, and applied in an extravagant manner the principles of the Old Testament theocracy. He himself became king of Zion. It is impossible to account for his conduct, and the extraordinary influence which he exercised, without the supposition of real fanaticism; but sensuality, vanity, and blood-thirstiness were intimately combined with it. He introduced polygamy, and displayed a great love of kingly pomp. The city was the scene of horrid excesses. In June, 1535, it was taken by the bishop of Münster. John and his chief accomplices suffered death with circumstances of fearful cruelty (Jan. 26, 1536), and his body was suspended in a cage from a high tower. He attempted to save his life by confession and submission.

JOHN OF NEPOMUK (more properly, POMUK), a popular Bohemian saint of the Catholic church, and honored as a martyr of the inviolability of the seal of confession. He was born at Pomuk, a village in the district of Klatau, about the middle of the 14th century. Having entered into orders he rose rapidly to distinction, being created a canon of the cathedral of Prague, and eventually vicar-general of the diocese. The queen Sophia, the second wife of Wenzel or Wenceslaus IV., having selected him for her confessor, Wenceslaus, himself a man of most dissolute life, conceiving suspicions of her virtue, required of John to reveal to him what he knew of her life from the confessions which she had made to him. John steadfastly refused, and the king resolved to be revenged for the refusal. An opportunity occurred soon afterwards, when the monks of the Benedictine abbey of Kladran having elected an abbot, in opposition to the design of the king, who wished to bestow it upon one of his own dissolute favorites, John, as vicar-general, at once confirmed the election. Wenceslaus, having first put him to the torture, at which he himself personally presided, had him tied hand and foot, and flung, already half dead from the rack, into the Moldau, Mar., 1393. His body, according to the tradition, being discovered by a miraculous light which issued from it, was taken up, and buried with the greatest honor. His memory was cherished with peculiar affection in his native country, and he was eventually canonized as a saint of the Roman Catholic church, his feast being fixed for Mar. 20. By some historians, two distinct personages of the same name are enumerated: one, the martyr of the confessional seal; the other, of his resistance to the simoniacal tyranny of Wenceslaus; but the identity of the two is well sustained by Palacky, *Geschichte von Böhmen*, iii. 62.

JOHN OF SALISBURY, 1120-82; b. Salisbury. In 1136 he went to France, attended the lectures of the famous Abelard, and remained there for several years, studying scholastic logic, grammar, the classics, and theology. He was sent on important missions to popes Eugene III. and Adrian IV., by whom he was received with great honor. When Thomas à Becket became archbishop of Canterbury, he was made his secretary, was with him in his exile in France, returned with him to England, and witnessed his death. In 1176 he was appointed bishop of Chartres. His greatest works are: *Polycreticus sive de nugis Curialium et Vestigiis Philosophorum*; libri octo; a work of great erudition and caustic satire on the follies of courtiers, etc.; and *Metalogicus*, a defense of the studies of the schools against the sneers of the ignorant. His *Vita ac Passio S. Thomae*, and his letters, numbering 302, are interesting. His complete works, in 5 vols., were published in 1848. He is described as an elegant Latin poet, an impressive orator, and the most learned man of his time.

JOHN the PARRICIDE, commonly called **JOHN OF SWABIA**, son of Rudolf II., and grandson of Rudolf I. of Austria, was b. in 1289. On attaining his majority he applied to his uncle, Albert I. of Austria, to resign to him the whole or a part of his patrimony, which consisted of Kyburg and some estates in Swabia; but this Albert refused to do. After making many other abortive attempts to gain his end John formed a conspiracy with others who had cause to complain of Albert's rapacity, and determined to assassinate the emperor; seizing the opportunity when Albert was riding alone, on the bank of the Reuss, near the castle of Hapsburg, they attacked and murdered him, May 1, 1308. The conspirators fled in different directions, John betaking himself to Italy, where he led a wandering life and died in obscurity.

JOHN, PRESTER ("Priest John"), the supposed Christian king and priest of a mediæval kingdom in the interior of Asia, the locality of which was vague and undefined. In the 11th and 12th centuries, the Nestorian missionaries penetrated into eastern Asia, and made many converts among the Kerait or Krit Tartars, including, according to report, the khan or sovereign of the tribe, Ung (or Ungh) Khan, who resided at Karakorum, and to whom the afterwards celebrated Genghis Khan was tributary. This name the Syrian missionaries translated by analogy with their own language, converting *Ung* into "Jachanan" or "John," and rendering *Khan* by "priest." In their reports to the Christians of the West, accordingly, their royal convert figured as at once a priest and the sovereign of a rich and magnificent kingdom. Genghis Khan having

thrown off his allegiance, a war ensued, which ended in the defeat and death of Ung Khan in 1202; but the tales of his piety and magnificence long survived, and not only furnished the material of numberless mediæval legends (which may be read in Assemani's *Bibliotheca Orientalis*, III. ii. 484), but supplied the occasion of several of those missionary expeditions from western Christendom, to which we owe almost all our knowledge of mediæval eastern geography. The reports regarding Ung Khan, carried to Europe by the Armenian embassy to Eugene III., created a most profound impression; and the letters addressed in his name, but drawn up by the Nestorian missionaries, to the pope, to the kings of France and Portugal, and to the Greek emperor, impressed all with a lively hope of the speedy extension of the gospel in a region hitherto regarded as hopelessly lost to Christianity. They are printed in Assemani's *Bibliotheca Orientalis*. The earliest mention of Prester John is in the narrative of the Franciscan father, John Carpini, who was sent by pope Innocent IV. to the court of Batû Khan of Kiptchak, the grandson of Genghis Khan. Father Carpini supposed that Prester John's kingdom lay still further to the east, but he did not prosecute the search. This was reserved for a member of the same order, father Rubruquis, who was sent as a missionary into Tartary by St. Louis, and having reached the camp of Batû Khan, was by him sent forward to Karakorum, the seat of the supposed Prester John. He failed, however, of his hope of finding such a personage, the khagan of Karakorum, Mangû, being still an unbeliever; and his intercourse with the Nestorian missionaries, whom he found established there, satisfied him that the accounts were grievously exaggerated. His narrative, which is printed in Purchas's *Collection*, is one of the most interesting among those of the mediæval travelers. Under the same vague notion of the existence of a Christian prince and a Christian kingdom in the east, the Portuguese sought for traces of Prester John in their newly-acquired Indian territory in the 15th century. A similar notion prevailed as to the Christian kingdom of Abyssinia, which, in the hope of finding Prester John, was visited so late as the reign of John II. of Portugal (148-95) by Pedro Covilham and Alfonzo di Payva, the former of whom married and settled in the country. See an essay on this head in Ritter's *Erdkunde*; also Oppert's *Der Priester Johannes* (1864, 2d ed. 1870).

JOHN C. GREEN SCHOOL OF SCIENCE. See COLLEGE OF NEW JERSEY.

JOHN, EPISTLES OF (JOHN, *ante*), three in number. The first and longest is quoted, as an undoubted work of the apostle John, by Polycarp, who in mature age was, about 100 A.D., made bishop of Smyrna, and was a disciple of John, well acquainted with his character, doctrine, and writings. It is ascribed to John by Papias also, who, contemporary with him and bishop of Hieropolis, received his doctrine, according to his own statement, from the living voice of followers of the apostles. It is contained also in the Syriac version of the New Testament, made not later than the early part of the 2d c., in all the other ancient versions, and in all extant catalogues of canonical books. It is acknowledged by Irenæus, Clement of Alexandria, Tertullian, Origen, Cyprian, Eusebius, Athanasius, and other ancient ecclesiastical writers. "Against this weight of historical evidence," says Olshausen, "nothing can be effected by the mere conjectures of modern times; and at present all theologians are perfectly agreed in the acknowledgment of this precious relic of the beloved disciple." Its subject-matter may be divided into four sections: I. 1-7, recapitulates the personal testimony of the apostles to the divinity and incarnation of the Lord Jesus; and declares that the union of faith and holiness is necessary to the enjoyment of fellowship with God; II. i. 8-ii. 17, asserts the sinfulness of all men; declares the divinely provided method of forgiveness through confession and faith in the atonement and intercession of Christ; specifies obedience to God and love to men as essential marks of true faith; gives counsel to the old and young; and warns Christians against love of worldly and transient things; III. ii. 18-29, affirms that all who deny the Messiahship of Jesus are anti-christs; declares that true Christians are anointed of God so that they can distinguish truth from error; and exhorts those who profess the name of Christ to abide in him, so that, at his coming, they and the apostle himself may not be ashamed; IV. iii.-v., sets forth the great privileges of true believers as the children of God; their consequent happiness and duties; and the various marks by which Christians and genuine Christianity may be distinguished from the children and doctrines of the evil one. The question concerning the genuineness of the 7th verse of chapter v. on the three heavenly witnesses has been strenuously debated by biblical students during four centuries. The preponderance of evidence is that the passage was not in the original, or in any ancient Greek manuscript; but was interpolated into Latin versions and a few late and Latinized Greek manuscripts. It is now consequently rejected by the great majority of biblical critics.

That the external evidence for the genuineness of the second and third epistles is less abundant and decisive than that for the first is accounted for by the fact that they are very brief, and are addressed to individuals. They would, therefore, naturally be read by fewer persons, and be circulated more slowly. Yet there is uncontradicted external evidence sufficient to establish their genuineness as writings of John. Irenæus quotes a passage of the second epistle; Clement of Alexandria wrote a commentary on it, and probably also on the third; Origen says that the apostle John left a second and third epistle; which, however, he adds, were not universally accepted as genuine. Dionysius

and all later Alexandrian writers mention them as productions of the same John that wrote the first epistle and the gospel. Ephrem Syrus, in the 4th c., speaks of them as John's; and in the 5th c. they were almost universally received. The internal evidence for their genuineness is strong. Many of the sentiments contained in them are found substantially in the first epistle; the style, diction, and tone of thought in all three are similar; and the zeal expressed by the writer for the truth agrees well with the boldness attributed to John from the beginning.

The second epistle, addressed to the elect lady, or the elect Kyria, and her children, congratulates her on their consistent Christian conduct; exhorts them all to cherish genuine love founded on faith and obedience; and warns them against giving aid or countenance to false teachers by receiving them into their house or even by extending to them friendly greeting.

The third epistle is addressed to Gaius, whom it characterizes as beloved, spiritually minded, consistent, and kind. This character agrees well with that of Gaius of Corinth, whom Paul commends as hospitable to him and to the whole church. He, however, was converted under Paul's ministry, while John seems to regard the Gaius to whom he wrote as one of his children. The object of the epistle was to acknowledge the kindness which Gaius had already shown to the strangers who were traveling as Christian missionaries, and to ask his continued help for them on their journey in a manner suitable to their character as God's servants, who, for Christ's sake, had renounced all resources outside of the church. John says also that he had written, probably on this subject, to the church; but that Diotrephes, in his love of pre-eminence, would not give heed to his request, and would not allow other members of the church to comply with it. From what is said of Diotrephes it is plain that he was an arbitrary and ambitious man—the type of a large class—who had, either formally or practically, attained the chief place in the church. The apostle, promising to attend to his case when he visited the church, exhorts Gaius to follow good and not bad examples, and commends to him Demetrius as well known to the apostle himself, and of good report among all the brethren.

JOHN FREDERICK, THE MAGNANIMOUS, 1503-54; Elector of Saxony; b. Torgau, was the son of John the constant, whom on his death in 1532 he succeeded in the electorate in conjunction with his brother Ernest. He officially sanctioned the reformation in 1553, and led the Protestant league of Schmalkalden against Charles V. He was taken prisoner at Mühlberg and condemned to death, but released at the intercession of his cousin Maurice of Saxony. On the death of Ernest in 1553 he became sole elector.

JOHN GEORGE I., 1585-1656; Elector of Saxony, succeeding his brother, Christian II., in 1611. During the thirty years' war his course was vacillating, sometimes favoring the emperor, sometimes the Protestant allies. In 1635 he made peace with the emperor Ferdinand II.

JOHN or JOHANN, NEPOMUK MARIA JOSEPHI, 1801-73; King of Saxony; b. Dresden; youngest son of duke Maximilian of Saxony; was president of the ministry of finance, from which he retired in 1831; commander of the national guard, 1831-46. On the death of his brother, Frederick Augustus II., Aug. 9, 1854, he became king. In the war of 1866 he sided with Austria against the western powers, and in the battle of Königgrätz fought against the Prussians who had entered Saxony. Peace being concluded, king John agreed to pay a large sum to Prussia, and to cede the fortress of Königstein. Saxony afterwards joined the North German confederation, and was conspicuous in the Franco-Prussian war of 1870-71. John was fond of antiquarian research. In 1838 he visited Italy, and published a German translation of the *Divina Commedia* of Dante with valuable notes. In 1824 he was elected president of the antiquarian society of Saxony, and in 1852-53 was president of the German society of history and antiquities. He left manuscript translations of 70 English poems.

JOHN OF AUSTRIA, or DON JUAN D'AUSTRIA, was a natural son of the emperor Charles V., and was born at Regensburg, on Feb. 24, 1546. It is uncertain who his mother was. He was early brought to Spain, and after the death of his father he was acknowledged by his half-brother, Philip II.; honors and an annual allowance were bestowed upon him, and he was educated along with the prince of Parma and the infant Don Carlos. He was intended for the church; but his own inclination was for military employment, and in 1570 he received the command of an army sent against the rebellious Moors in Granada, whom he completely rooted out of the country—signalizing himself at once by valor and by cruelty. In 1571 he was appointed to the command of a maritime expedition—in which the forces of Spain, the pope, and Venice were united against the Turks—and defeated the Turks in a great battle near Lepanto (Oct. 7). Discord breaking out among the allies, Don Juan separated himself from the rest, took Tunis, and conceived the design of forming a kingdom for himself in the n. of Africa. But Philip, jealous of this design, sent him to Milan, to observe the Genoese; and afterwards, in 1576, as viceroy to the Netherlands. In this capacity he sought to win the favor of the people by mildness; but being left unsupported by Philip, he was hard

pressed for a time, till the arrival of the prince of Parma with troops enabled him to restore the fortunes of Spain by the victory of Gemblours over William the silent in 1577. But Philip was now apprehensive that Don Juan might make himself king of the Netherlands; and the untimely death of the latter in his intrenched camp at Namur, Oct. 1, 1578, was not without suspicion of poison.—See Dusmenil's *Histoire*, and Havemann's *Leben* (Gotha, 1865) of John.

JOHN OF GAUNT, or of GHENT, 1339-99; Duke of Lancaster; b. Ghent; son of Edward III. In the French wars he served with great bravery under his brother, Edward the black prince. In 1370 he married Constance, the daughter of Peter the cruel, king of Castile and Leon, and on the death of Peter claimed the sovereignty of those kingdoms, but subsequently giving his daughter in marriage to the heir-apparent, he relinquished his claims. His son, surnamed Bolingbroke, became king of England under the title of Henry IV.

JOHN O' GROAT'S HOUSE (or, more correctly, it would seem, JOHNNY GROAT'S HOUSE), on Dungansby head, the north-eastern extremity of the mainland of Scotland, has been long widely known as marking one of the limits of that country, as in Burns's line:

Frae Maidenkirk to Johnny Groat's.

It stood on the beach at the mouth of the Pentland firth, and was probably built for the reception of travelers crossing the ferry to the Orkneys. Tradition gives a more romantic origin. In the reign of king James IV. (1488-1513), three brothers—Malcolm, Gavin, and John Groot or Grot—supposed to be Hollanders, settling in Caithness, acquired the lands of Warse and Dungansby. When their descendants had so multiplied that they were eight families, disputes arose as to precedence at a yearly festival which they were wont to keep. John Groat settled the controversy by building an eight-sided house, with a door and a window in each side, and an eight-sided table within, so that the head of each of the eight families of Groats might enter by his own door, and sit at his own head of the table. Whatever credit may be due to this legend, there can be no doubt as to the existence of John Grot. In the year 1496 "John Grot, son of Hugh Grot," had a grant of a penny-land in Dungansby from William, earl of Caithness. In 1525 "John Grot in Dongansby," as his name is written, chamberlain and bailie of John, earl of Caithness, gave seisin to the Trinity friars of Aberdeen, of a yearly payment from the island of Stroma, in the Pentland firth. He died soon afterwards, and was succeeded by his son William, or his grandson John. In 1540 there was a payment from the Scottish treasury of £20 "to John Grote, for freight of his ship sent by the queen's grace, from St. Andrews to Orkney, to the king's grace with writings." In 1547 John Grot had a pardon from queen Mary for helping the earl of Caithness to storm the earl Marischal's castle of Akirgill. About 1741 Malcolm Groat sold his lands in Dungansby, with the ferry-house, to William Sinclair of Freswick. The family of Groat still exists; but a small green knoll is all that now remains of John o' Groat's house. The shell *Cypraea Europa*, which abounds in the neighborhood, has received the name of "John o' Groat's bucky."

JOHNS, or JOHN'S, ST. (*ante*); geographical. See SAINT JOHN'S.

JOHN, SAINT (*ante*). See SAINT JOHN.

JOHN'S COLLEGE, or the College of St. John the Baptist, Oxford, succeeded an older institution, founded by archbishop Chichele in 1456, for monks of the Cistercian order. Sir Thomas White procured a license from king Philip and queen Mary, and in 1555 founded a college, dedicated "to the honor of God, the Virgin Mary, and St. John the Baptist," on the site of archbishop's Chichele's college. The foundation consists of a president, 50 fellows and scholars, and a choir. Six of the fellowships are founders' kin; two from Coventry, two from Bristol, two from Reading, and one from Tunbridge schools; all the rest are from Merchant Taylor's school. In 1854 four fellowships were added by the will of Dudley Fereday, esquire. These are open, with a preference, however, first, to founder's kin, and second, to natives of Staffordshire. This college presents to 30 benefices. In 1879 there were above 500 names on the books. The arrangements of this college were not altered by the commissioners under 17 and 18 Vict. 81. The commissioners of 1852, indeed, proposed extensive changes, which the commissioners under the act were disposed to carry out, but the college succeeded in baffling their endeavors. Similar changes, however, to those recommended by the commissioners—involving, among other points, the throwing open of 18 fellowships—have been subsequently introduced by the authority of the privy council.

JOHN SCOTUS. See ERIGENA, *ante*.

JOHNS HOPKINS UNIVERSITY, in Baltimore, Md., began its instructions in 1876. It was established by the liberality of Johns Hopkins, a merchant of Baltimore, who gave a fund of about \$7,000,000 for the establishment of a university and a hospital. The gifts are free from ecclesiastical and political control, and free also from burdensome conditions. It is not intended to use any part of the capital for buildings. The hospital is now being constructed; the university occupies a temporary site, near

the Peabody institute. There are now (1879-80) 32 instructors of various grades, and 162 students. There are 70 fellowships open to students from any part of the country, and a larger number of scholarships, a part of them giving free tuition, open to young men from Maryland, Virginia, North Carolina, and the district of Columbia; and a part of them open for competition to any young men. Eighty-two of the present students have already received an academic degree. Graduate, matriculate, and non-matriculate students are received and instructed according to their various requirements. The degrees of doctor of philosophy and bachelor of arts are conferred upon students who pass the requisite examinations. Equal care is bestowed upon the scientific and literary departments. Instruction is given in Sanskrit, Greek, Latin, French, German, and English, as well as in the Semitic languages; in logic, philosophy, history, and political science. The higher mathematics are taught far beyond the line of the ordinary college course. In the chemical, physical, and biological laboratories, ample arrangements have been made for instruction and investigation. The scientific apparatus has cost nearly \$30,000; the library nearly \$25,000; and additions are constantly made to the books and instruments. More than 250 literary and scientific periodicals are taken in the reading-room, which is open to the students from 9 A.M. to 10 P.M. Courses of lectures by resident and non-resident professors are open to the public during a considerable portion of every year. Classes for teachers in physiology and zoology (both involving the constant use of the microscope), in early English and in mathematics, have been taught on Saturdays. The Chesapeake zoological laboratory, now open at Beaufort, N. C., is engaged in the investigation of marine life on the Atlantic seaboard. Four scientific publications are issued under the auspices of the university, devoted respectively to mathematics, chemistry, biology, and philology. President, D. C. Gilman, LL.D.

JOHNSON, a co. in n.w. Arkansas, bounded s. by Arkansas river; 580 sq.m.; pop. '80, 11,565. It is drained by Spadra creek. The surface is uneven and well timbered. Soil generally fertile. Staple products: cotton, tobacco, maize, and pork. Coal is found. The Little Rock and Fort Smith railroad passes through the county. Co. seat, Clarksville.

JOHNSON, an eastern central co. of Georgia; 250 sq.m.; pop. '80, 4,800. It is bounded w. by the Oconee river, and intersected by the Great Oloopee. Surface uneven, and much of it covered with forests. The staple products are cotton and maize. Co. seat, Wrightsville.

JOHNSON, a co. in eastern Kansas, bounded n.w. by the Kansas river, and partly drained by the Big Blue and Osage rivers; 500 sq.m.; pop. '70, 13,684. Surface nearly level, diversified by prairies and forests. Soil deep and fertile, producing oats, wheat, and maize. The co. is intersected by the Missouri river and several railroads, which meet at Olathe, the co. seat.

JOHNSON, a co. in eastern Kentucky; 450 sq.m.; pop. '80, 9,155. It is traversed by the w. fork of Big Sandy river. The surface is hilly and extensively covered with forests. Soil in the valleys is fertile. Staple products: wheat, maize, grass, and pork. Bituminous coal is found. Co. seat, Paintsville.

JOHNSON, a co. in southern Illinois; 325 sq.m.; pop. '70, 11,248; intersected by the Cairo and Vincennes railroad. Surface much broken by steep hills; soil fertile, producing wheat, maize, and oats. The co. abounds in limestone. Co. seat, Vienna.

JOHNSON, a co. in southern central Indiana, watered by the e. and w. forks of White river and Sugar creek; 320 sq.m.; pop. '70, 18,366. Surface rolling; extensively covered with forests; soil a fertile loam. Staples: wheat, maize, grass, and pork. Chief articles of manufacture are carriages, lumber, saddlery, and brick. There are several flour, planing, and saw-mills. The co. is intersected by the Jeffersonville, Madison and Indianapolis, and the Cincinnati and Martinsville railroads. Co. seat, Franklin.

JOHNSON, a co. in s.e. Iowa, watered by the Iowa river, traversed by the Chicago, Rock Island and Pacific, and the Burlington, Cedar Rapids and Northern railroads; 610 sq.m.; pop. '80, 25,429. The surface is varied with prairies and forests; soil very fertile. Maize, oats, hay, flax, and pork are the staple products. The co. has deposits of limestone. The principal manufactures are carriages, saddlery, and woolen goods. Co. seat, Iowa City.

JOHNSON, a co. in western Missouri, intersected by the Missouri Pacific railroad, and partly traversed by the Osage branch of the Missouri, Kansas and Texas railroad; 750 sq.m.; pop. '70, 24,648. The surface is varied by prairie and forest; soil fertile and adapted to pasturage. Staples: maize, wheat, oats, hay, and pork. Among the minerals are bituminous coal and limestone. There are manufactories of carriages, agricultural implements, and saddlery, and of flour; also saw-mills. Co. seat, Warrensburg.

JOHNSON, a co. in s.e. Nebraska, intersected by the Atchison and Nebraska railroad, and drained by the Big Nemaha river, and partly by affluents of the Little Nemaha river; 378 sq.m.; pop. '80, 7,597. It has a rolling surface, and soil very fertile, producing wheat, oats, maize, and hay. Co. seat, Tecumseh.

JOHNSON, a co. in n.e. Tennessee, bounded n. by Virginia, s.e. by North Carolina; 3,000 sq.m.; pop. '70, 5,852. It is mountainous and thickly wooded. The valleys are fertile, producing maize, oats, and grass. Iron ore is found. The co. is watered by the Watauga river and its branches. Co. seat, Taylorsville.

JOHNSON, a co. in n.e. Texas, bounded s.w. by the river Brazos; 600 sq.m.; pop. '70, 4,923. It has a rolling surface and fertile soil. Staples: cotton and maize. Co. seat, Cleburn.

JOHNSON, ALEXANDER BRYAN, 1786-1807; b. England. Emigrated to the United States and settled in Utica, N. Y., in 1801. He studied law and was admitted to practice, but established himself instead in the banking business. Of a metaphysical turn of mind, he devoted himself to the study of abstruse subjects in philosophy, and published a number of works. *Philosophy of Human Knowledge, or a Treatise on Language; Treatise on Language, or the Relation which Words bear to Things; Physiology of the Senses; Religion in its Relation to the Present Life*, etc. His *Physiology of the Senses* was favorably considered in the *Westminster Review*.

JOHNSON, ANDREW, 17th president of the United States of America, was b. at Raleigh, N. C., Dec. 29, 1808. At the age of 4 years he lost his father, who was drowned in attempting to save the life of a friend; and when 10 years old he was apprenticed to a tailor, whom he served for 7 years, receiving no schooling. A visitor to the shop where he worked used to read aloud from a collection of speeches of British statesmen. This aroused young Johnson's interest and ambition; he learned the alphabet, borrowed the book, and with the aid of a journeyman learned to read, working at it two or three hours every night. At the expiration of his apprenticeship he worked for two years as a journeyman at Laurens Court-house, S. C.; but a love-disappointment, caused by his humble position, induced him in 1826 to emigrate to Greenville, Tenn., where he soon after married, and his wife taught him writing and arithmetic. In 1828 he was elected to his first office—alderman of the village; in 1830 he was chosen mayor, and twice re-elected; in 1835 he was elected to the state legislature, and again in 1839; in 1840 he was a presidential elector, and canvassed the state for Mr. Van Buren, the democratic candidate; in 1841 he was elected to the state senate; and in 1843 to the congress of the United States, where for 10 years he supported the policy of the democratic party. In 1853 he was elected governor of Tennessee, and again in 1855. In 1857 he was elected by the legislature a member of the U. S. senate, in which he advocated the union policy of the republican party; and on the occupation of Nashville by the federals, 1862, was appointed by president Lincoln military governor of Tennessee. In this position he gave so much satisfaction to the north that in 1864 he was nominated by the republican party for the office of vice-president, and was elected with president Lincoln, then re-elected for his second term, and took the oath of office Mar. 4, 1865. On April 14, by the assassination of president Lincoln, he succeeded to the presidency, but soon disappointed his party by taking a moderate, conservative course, scrupulously respecting his oath to support the constitution. In 1866 his policy appeared for a time likely to meet with popular favor; but some indiscreet and violent speeches, during a tour to Chicago and St. Louis, turned the tide against him, and in the congressional elections his opponents triumphed by increased majorities. His vetoes were generally nullified by the two-thirds vote of both houses. In 1867 Johnson suspended Mr. Stanton, secretary of war, who was reinstated by the senate the following year. An attempted *coup d'état* to gain possession of the war office during this quarrel led to the impeachment of the president in 1868, but he was acquitted. His term of office expired in 1869; and afterwards Johnson unsuccessfully sought to be governor of Tennessee and U. S. senator. He died in 1875. See *Life of Andrew Johnson* (New York, 1866); *The Trial of Andrew Johnson* (official), 3 vols., 1868.

JOHNSON, ANDREW (*ante*), 1808-75; b. N. C.; son of Jacob Johnson, a petty city officer in Raleigh. The father lived only four years after Andrew's birth, and, being extremely poor, he left no funds for the boy's education. When ten years old he was bound to a Mr. Selby to learn the business of tailoring. While there he took great interest in readings by a gentleman who frequently passed an hour or two in the humble shop. Andrew listened with close attention, particularly to the speeches of great English orators. But his utter lack of education was a great grievance, and he resolved to learn to read by himself. For this purpose he borrowed books and passed all the time between labor and sleep in diligent study. Just before his term of service was out he went to work on his own account at Laurens Court-house, S. C.; but in the spring of 1826 he went back to Raleigh. His tailor-master had gone to another place, and Andrew made a foot-journey of 20 m. to see him, his object being to apologize for leaving service before his term was out, and to pay for the unfulfilled months. Selby wanted security, but being an entire stranger in the place Johnson was unable to give it. His mother depended upon him for support, and he determined to try his fortunes in Tennessee. Taking her with him he made his way to Greenville, in the extreme eastern part of the state. Here he worked as a journeyman tailor about a year, took a wife, and concluded to make the place his permanent home. His wife was fairly educated, and she became his tutor. He could read, but that was the most of his acquirements. She taught him writing and ordinary arithmetic, these, with reading,

being then the extent of the education of the working classes in that region. Johnson was naturally a politician, and when only 20 years old he got up a party of workingmen in opposition to the planters and other well-to-do citizens who had always had their own way in the town. The workingmen chose him alderman and re-elected him twice. In 1830 Greenville was a city, and Johnson was elected mayor, serving three years. His ambition was to be a public speaker, and to qualify himself he joined a debating society, most of whom were students of Greenville college. In 1834 Johnson took an active part in advocating the proposed new constitution for the state. Parties at this period were whigs and democrats; Johnson was anxious to get into the legislature, and, in accordance with the custom in that part of the union, in 1835 he nominated himself for the assembly, declaring himself a democrat. As the nomination was not readily accepted by the people, he took the field in person, and by several strong common-sense speeches quite silenced the other side and easily secured his election. The main feature of his course as a member was his opposition to the creation of a debt of \$4,000,000 for internal improvements unless such debt should be approved by the vote of the people. But the bill was passed, and in 1837 Johnson was defeated on account of his opposition to it. That his course was right was proved soon afterwards; the works undertaken were abandoned, and the greater portion of the money was stolen or wasted. In 1839 he was again chosen a member of the legislature. In the "Log Cabin and Hard Cider" campaign for president in 1840 he was on the democratic electoral ticket, and made many speeches for Van Buren. The next year he was elected to the state senate, and in 1843 he was chosen a member of congress, where he served his constituents so satisfactorily as to secure four consecutive re-elections. Within his ten years' service in the house of representatives he supported the annexation of Texas and the war on Mexico; the refunding of gen. Jackson's fine for imprisoning a judge at New Orleans in 1815, and the tariff of 1846. He favored the acceptance of the 49th degree of latitude to settle the Oregon boundary dispute, and was one of the foremost of the advocates of a homestead law. He was also a firm supporter of the president's veto power; and on all occasions he was in favor of the greatest economy in public expenditures. He left congress Mar., 1853, and in the same year was chosen governor of his state over the whig aspirant. Two years afterwards he was re-chosen over a candidate supported both by the whigs and the newly-organized American party. This last canvass was very turbulent, and many threats were made against the democratic candidate and others. On one occasion Johnson stepped to the front of the platform from which he was to speak, drew a pistol so that it could be seen by all, laid it before him, and remarked: "Fellow-citizens: I have been informed that part of the business to be transacted on the present occasion is the assassination of the individual who now has the honor of addressing you. I beg respectfully to propose that this be the first business in order. Therefore if any man has come here to-night for the purpose indicated, I do not say to him let him speak, but let him shoot." Naturally a man of such character was popular with the rude people in that comparatively new country. The tailor's apprentice, who at ten years of age could not even read, had, by force of character and an iron determination to advance, filled the highest offices in the state. If he lacked education and fitness for polite society, he had enough for the people who supported him. But during all this political work and the duties of office he improved every occasion for study, and little by little accumulated enough education to fit him for the responsible positions which he was called upon to fill.

In 1857 he was elected to the United States senate, where, before the breaking out of the rebellion, he was conspicuous in advocating the 160-acres homestead act; and chiefly through his influence the bill was passed, but it was vetoed by president Buchanan. In 1858 Jefferson Davis, because, as he alleged, of Indian and Mormon troubles, proposed a considerable addition to the regular army. Johnson opposed it, and finally instead of a temporary addition of 4,000 men the bill when passed authorized but two regiments to serve a year and a half only. Another great measure opposed by Johnson was the Pacific railroad. Thus far in a political career of 30 years he had said very little on the slavery question, observing the silence characteristic of the party to which he belonged; but he never failed to place the question of the union of the states far above the existence or extinction of slavery. In the democratic national convention of 1860 the delegates from Tennessee put Johnson forward as their candidate for president, but he did not come near the nomination. In his own state he began a vigorous support of Breckinridge, who was the candidate of the extreme pro-slavery section of the party. Soon discovering, however, that secession was contemplated, he went directly against Breckinridge, and gave loyal support in the senate to the cause of union. While he was speaking against secession in the senate, his state, through her legislature, voted to go with the secessionists, and violence broke out everywhere. There had been a vote of the people on the question of calling a convention to consider the subject of secession, and the opponents of such a convention were largely in the majority. Therefore when the legislature assumed to do what the people had just refused, the excitement was intense, so much so that when Johnson went home in the spring of 1861 it was at the risk of his life. Personal assaults were threatened, but his undaunted courage was well known and no one dared attack him, satisfying their spite by burning him in effigy in all the large towns in the state. He worked hard and faithfully for the union in the Tennessee convention, in furnishing assistance to union fugitives, and in establishing a camp which

might serve as a place of refuge. The secessionists made their nearest personal attack upon Johnson when they turned his family out of doors and confiscated his slaves. Early in March, 1862, Johnson was made military governor of Tennessee, and he commenced his duties at Nashville about the middle of the month. He sent forth a proclamation in which he said "while it may become necessary, in vindicating the violated majesty of the law and reasserting its imperial sway, to punish intelligent and conscious treason, no merely retaliatory or vindictive policy will be adopted." His proposed leniency had no effect upon the determined secessionists. For a long time he labored earnestly to bring his state back into the union; but neither mild nor harsh measures produced any good effect. On one occasion, in view of numerous outrages by secessionists, he proclaimed that "in every instance in which a union man is arrested and maltreated by marauding bands, five or more rebels from the most prominent in the immediate neighborhood shall be arrested, imprisoned, and otherwise dealt with as the case may require; and further, in all cases where the property of citizens loyal to the government of the United States is taken or destroyed, full and ample remuneration shall be made to them out of the property of such rebels in the vicinity as have sympathized with and given aid, comfort, information, or encouragement to the parties committing such depredations." Near the beginning of Mar., 1864, under Johnson's special orders, Tennessee elected officers, both state and local, and the wheels of an ordinary government began to move. Three months afterwards Andrew Johnson was nominated for vice-president on the ticket with Mr. Lincoln. He was elected and inaugurated Mar. 4, 1865. His remarkable address on that occasion was the cause of deep regret not only among his friends, but among all loyal people. Six weeks afterwards Mr. Lincoln was shot by Booth, and the tailor's apprentice of Raleigh became president of the United States.

This was the third time that a vice-president had risen to the executive office through the accident of death, and in this case, as in the cases preceding, the incumbent was soon at variance with the party that elected him. President Harrison died April, 1841, one month after his inauguration, and vice-president Tyler took the chair. In less than six months he had estranged his whig supporters by vetoing an act for the creation of a national bank, the fiscal bank of the United States, which act had been passed at his express desire. The bill was modified, again passed, and again vetoed. Then his cabinet, with the exception of Mr. Webster, the secretary of state, resigned. A cabinet was appointed of whom nearly all were democrats. By these and other acts the first "accidental" president lost the confidence of the whigs without gaining that of the democrats. He was nominated for president, but after three months' consideration withdrew his name. President Taylor died July 9, 1850, a year and four months after his installation, and vice-president Fillmore succeeded to the chief office. He adhered to the whig party, but his approval of the law for the return of fugitive slaves gave great offense to a large number of his supporters. To the mere approval he added a proclamation in which he denounced interference in the case of captured fugitives, and declared that he would enforce the law at all hazards. The result of his administration was the overthrow of the old whig party and the capture of all branches of the government by the democrats. Andrew Johnson, on taking the executive chair, made a brief speech, which was understood to mean that he would deal with the utmost severity with the authors of the rebellion, which had been crushed only a few days before by the surrender of Lee. He said: "The American people must be taught, if they do not already feel, that treason is a crime and must be punished; that the government will not always bear with its enemies; that it is strong, not only to protect but to punish. The people must understand that it [treason] is the blackest of crimes and will be surely punished." Instead of following this policy his course was the very opposite. He hastened to bring Virginia back to the union, and near the close of June he brushed aside all regulations with regard to trade with the seceding states. He proclaimed general amnesty to all (except a few specified classes) who would swear to be loyal to the union. Under his proclamations provisional governments were set up in a number of the states but a few weeks before in rebellion, and he prepared the way for them to send members to congress as if no secession had occurred. These acts put him in opposition to the majority of the republicans in congress. In all that he had done there had been no thought of securing the political rights of the freedmen, who were left entirely in the control of their late masters. Congress appointed a committee on reconstruction and on the admission of southern members to the house, and adopted the civil rights act, adding an act to increase the power and efficiency of the freedmen's bureau. These last two bills were vetoed by president Johnson, but they were readopted and passed by the necessary majority. This action was severely denounced by Mr. Johnson, who characterized the course of congress as another rebellion. Thenceforward the republican president was in direct antagonism to the republican majorities in the senate and house, and, it may be added, with the mass of the party in the union. In Aug. an attempt was made by a thinly-attended convention at Philadelphia to form a party to support the president's policy, but nothing came of it. The disaffection soon began to work in the cabinet, and in July three members resigned in consequence of irreconcileable differences with the president. But he was so persistent in his course that when going with Gen. Grant and others to Chicago, to witness the laying of the foundation of a monument to the late Stephen A. Douglas, he

took advantage of every stopping of the train to address the people in advocacy of his policy, usually adding denunciatory remarks concerning the course of the republicans in congress. Congress declared that the 14th amendment to the constitution should be ratified by every seceding state as a preliminary to readmission to the union. This amendment declared all persons born or naturalized in the union to be citizens, and, of course, included all the freedmen in the south. The president vetoed the resolution. During the next session acts were passed requiring the right of voting to be granted without regard to color, in territories applying for admission as states. This, too, was vetoed; but in all cases the bills were re-passed and became laws. Mr. Johnson's next trouble was with the military governments and commanders. In Mar., 1867, in spite of the familiar veto, an act was passed making five military districts in the ten most important of the southern states. The president appointed the five commanders, but at the same time procured from the attorney-general, Mr. Stanbery, an opinion as to certain legal effects of the several acts aiming at reconstruction. The opinion, the general tenor of which was to destroy the efficiency of the acts of congress, was supported by all the members of the cabinet except Mr. Stanton, the secretary of war. Thus fortified the president sent this opinion to the military commanders in the south as an order for their guidance. The effect was told in a report by gen. Sheridan, who said: "The result of Mr. Stanbery's opinion is beginning to show itself by defiant opposition in all acts of the military commander, and by impeding and rendering helpless the civil officers acting under his appointment." The next move in congress was to make the gen. of the army the sole supervisor of the acts of the military commanders. Mr. Johnson vetoed the act, but it was passed notwithstanding his objections. A few months later the president retaliated by putting new commanders over the districts. Mr. Stanton's opposition to the Stanbery opinion was not forgotten, and in Aug. he was displaced as secretary of war, and gen. Grant was given the position for the time being. Mr. Stanton protested that his removal was in violation of the tenure-of-office law, but nothing came of his protest at the time. Aug. 20, 1867, a proclamation from the president stated that peace, order, and the supremacy of civil government existed throughout the union. Early in Sept. another amnesty proclaimed by him restored to suffrage and relieved from confiscation of property nearly all the people who had been in the secession movement. At the meeting of congress in Sept. Mr. Johnson gave the the senate his reason for removing Mr. Stanton, but the senate opposed the removal, thus replacing the secretary. Five months afterwards he again removed Stanton, and put Lorenzo Thomas in his place. The senate immediately resolved that "the president has no power to remove the secretary of war and designate any other person to perform the duties of that office." Mr. Johnson's long contest with congress was drawing to a dramatic close. The day after the adoption of the resolutions by the senate, the house of representatives determined upon the president's impeachment; the vote being 126 in favor and 47 against such action. The articles of impeachment, eleven in all, recited many offenses, the principal of which were the removal of the secretary of war, the public expression of disregard of and contempt for the legislative branch of the government, the declaration that the one in session was not a constitutional congress, and particularly his obstruction to the execution of congressional acts. The trial commenced on Mar., 23, Mr. Stanbery (attorney-general) and judges Curtis and Nelson being the president's counsel. The main point of the defense was that Mr. Johnson's course in the work of reconstruction was merely the continuation of a plan resolved upon by president Lincoln and the members of the cabinet. In the senate, sitting as the court of impeachment, the final vote on contempt for congress and on the Stanton removal was: guilty, 35; not guilty 19. This amounted to an acquittal, as it requires two-thirds of the senate to declare a defendant guilty. As soon as the trial was over Mr. Stanton voluntarily gave up his office and was succeeded by gen. Schofield.

At the democratic national convention in New York, July 4, 1868, Mr. Johnson's name was among the list of candidates for president. On the first ballot he had 65 votes, standing second on the list, Pendleton having 105. But his vote diminished rapidly until, on the 19th ballot, his name did not appear. On the same day Mr. Johnson proclaimed pardon to all persons except such as might be under indictment before a federal court. On Christmas day, 1868, he proclaimed complete pardon to all who had been directly or indirectly concerned in secession, or in any way taken part in the war against the union. This was his last important official act. He was succeeded, Mar. 4, 1869, by gen. Grant, and at once repaired to his home in Greenville. Anxious to return to political life he sought the place of senator from Tennessee, and came within three votes of getting it. Two years later (1872) he ran as an independent candidate for congress, but the result was to elect the republican nominee. But in Jan., 1875, he was chosen U. S. senator, and was in his seat during the short extra session in Mar., his only noteworthy act being a speech against the recognition of the Kellogg government in Louisiana. For a man with so few early advantages—which may have accounted for his narrowness and obstinacy—he showed great ability, courage, and political acumen, while his honesty was never doubted.

JOHNSON, Lady ARBELLA, or ARABELLA, d. 1630; daughter of Thomas, 14th earl of Lincoln, wife of Isaac Johnson. She accompanied her husband to New England on

board the *Eagle*, whose name was changed in her honor to the *Arbella*. She died at Salem a little more than two months after her arrival in Massachusetts Bay.

JOHNSON, CAVE, 1793-1866. A resident of Tennessee, he entered the legal profession, and, for several years, held the office of circuit judge in that state. He was elected a representative in congress in 1829, and served eight years, and again, from 1839, six years. In 1845 he was called to the cabinet of president Polk as postmaster-general. On the election of gen. Taylor he returned to Tennessee, where he became president of a bank, which position he continued to fill until the outbreak of the war of secession. He remained loyal to the union, and was elected a state senator by that side, but age and declining health forced him to retire from political life.

JOHNSON, EASTMAN, b. Me., 1824. At an early age he developed talent as an artist, and succeeded in making his work so remunerative that he was enabled to defray the expense of study in Europe. He remained two years in Düsseldorf, and four years at the Hague, producing, among other works, "The Savoyard" and "The Card-Players," which were his earliest efforts in oil. He displayed a leaning towards *genre* subjects, and soon became famous in this department of art-work. Having made an examination of the leading European galleries, he settled in New York in 1856, where he continued to reside, contributing freely to the annual exhibitions of the national academy of design, in which he is an academician. His more noteworthy and popular works are "The Old Kentucky Home;" "The Boyhood of Abraham Lincoln;" "The Wounded Drummer-Boy;" "Mount Vernon Kitchen," etc. Mr. Johnson's paintings have been among the best known and most popular of those of any American artist, having been very largely multiplied by chromo-lithography. He excels in composition, while his execution is refined, though broad and spirited. In some of his work he resembles Edouard Frère, one of the masters in the modern French school of *genre* painting.

JOHNSON, EDWARD, 1599-1672; b. England; came to New England with gov. Winthrop about 1630, and settled in Woburn, Mass., where he became prominent in local organization. He was representative to the general court during several terms, and its speaker in 1655, besides holding the office of recorder of the town of Woburn from its incorporation to the date of his death. He wrote a history of New England, from 1628 to 1652, which was published in 1654 under the title, *Wonder-working Providence of Zion's Savior in New England*. This work has been reprinted in the *Mass. Hist. Coll.*

JOHNSON, HERSCHEL V., 1812-80; b. Ga.; a practicing lawyer and prominent democratic politician in his own state, with somewhat of a national reputation. He was a U. S. senator in 1848; judge of the Georgia supreme court, 1849-53; governor of the state, 1853-57; and candidate for vice-president with Stephen A. Douglas in 1860. He was in the confederate senate during the war of secession.

JOHNSON, ISAAC, d. 1630; b. England; accompanied gov. Winthrop on board the *Arbella* to New England, and became one of the founders of the colony of Massachusetts Bay. He was among those who organized the first church at Charlestown, Mass., and he conducted the first settlement at Boston, which was made on account of its possessing better water facilities than Charlestown. Johnson was the wealthiest man in the colony, public-spirited, and generous, but he only lived three months after his arrival.

JOHNSON, Sir JOHN, 1742-1830; son of sir William; succeeded to his father's estates a year before the outbreak of the American revolution, and, raising a body of men, fled to Canada, where he was commissioned a colonel in the royal service. He defeated gen. Herkimer at Fort Stanwix in 1777, but three years later was himself defeated, and his property was confiscated by the U. S. government. The British government gave him a grant of land in Canada; he was made a member of the colonial council, and received the appointment of superintendent of Indian affairs, which he held until his death.

JOHNSON, JOSEPH, b. Charleston, 1776; was a graduate of the university of Penn.; studied medicine, and began practice in his native city, where he also held the office of mayor for many years. He was much interested in education, was commissioner of public schools, and president of the apprentices' library association. For 60 years he was a member of the South Carolina society, during 20 of which he was its president. He was active in politics, and strenuously opposed the nullification measures of 1832. Besides being the author of numerous essays and published papers upon a variety of topics, he compiled *Traditions and Reminiscences of the Revolution*, esteemed as an important adjunct to the history of that period.

JOHNSON, OLIVER, b. Vt., 1809; a prominent publicist and editor; was apprenticed to a printer in Montpelier, Vt., and entered the editorial profession in 1831. For 30 years he was earnestly engaged in advocating the anti-slavery cause in the various newspapers with which he was concerned, and as a lecturer and pamphleteer. From 1865 to 1870 he was managing-editor of the *Independent*, New York, and editor of the New York *Weekly Tribune* for the three years following. In 1873 he became the superintending editor of the *Christian Union*, a position which he continued to hold until 1876, when he became editor of the *Journal*, published in Orange, N. J., continuing until 1879. He now resides in New York, engaged in literary labor. Mr. Johnson's published works have been *A Dissertation*, in support of the doctrine of eternal punish-

ment (1832); several pamphlets upon the anti-slavery and other reforms, and (1880) *William Lloyd Garrison and his Times; or, Sketches of the Anti-Slavery Movement in America*, 430 pp. He is a clear and facile writer, and in all his public work has shown intenseness of conviction, keen sense of justice, and quick sympathy with whatever cause or class seemed to be under disadvantage. His early work, noted above, indicates theological views to which of late years he has had strong repugnance.

JOHNSON, PERCIVAL NORTON, 1793-1866; b. England; an expert metallurgist, much employed in consultation at important English mines. His father being an assayer, he was early familiarized with the nature and relations of metals, and first established the rules for accurately determining the analysis of bullion. Having found in use in Germany the alloy known as German silver, he introduced it into England. He improved the mechanism in use in some of the Cornish mines, and made important inventions and discoveries in mining and metallurgy.

JOHNSON, REVERDY, 1796-1876; b. Md.; studied law, and was admitted to the Maryland bar in 1815. He gained a high reputation as a profound lawyer, and was frequently employed in arguing important cases before the supreme court of the United States. He represented his native state in the U. S. senate, 1845-49, when he entered president Taylor's cabinet as attorney-general. After the death of gen. Taylor in 1850 Mr. Johnson continued to practice law in Baltimore, and edited the reports of the Maryland court of appeals from 1800 to 1826. In 1863 he re-entered the U. S. senate for six years, but was appointed minister to England in 1868. His negotiations towards a settlement of the disputed *Alabama* claims having proved unsatisfactory to the American government, and his convention with Great Britain being rejected by the senate of the United States, Mr. Johnson was recalled in 1869. During the trial of the assassins and conspirators concerned in the murder of Abraham Lincoln, Mr. Johnson prepared an argument in behalf of Mrs. Surratt (afterwards executed for complicity in the assassination) which the military court that tried the case refused to hear.

JOHNSON, RICHARD MENTOR, 1780-1850; b. Ky.; from being a practicing lawyer, a state legislator, and a member of congress, became the col. of a regiment of Kentucky mounted riflemen in the war of 1812, and did good service on the Canadian frontier. In 1813 Johnson raised another regiment of mounted soldiers, and supported gen. Harrison, particularly during the battle of the Thames. He was badly wounded in this engagement, but is said to have killed the celebrated chief Tecumseh, out of the mystery attending whose death originated the popular question, "Who killed Tecumseh?" In 1836 Johnson ran for vice-president on the ticket with Martin Van Buren, and being defeated by a few votes, and no choice being made, the senate selected him for the office in accordance with the law in such cases. In 1850 he was a member of the Kentucky state legislature, and died in Frankfort while occupying this position. He was distinguished for the kindness of his nature, and for the fascinating gentleness of his manners. He framed the law which abolished imprisonment for debt in Kentucky.

JOHNSON, RICHARD W., b. Ky., 1827; graduated at West Point, entered the U. S. infantry, exchanged to cavalry in 1855, and served against the Indians in Texas and Mexico. He was a capt. of cavalry in 1861, and in the same year promoted to command a brigade under gen. Buel. He fought gallantly in the army of the Cumberland, and distinguished himself at Stone river, Chickamauga, and Missionary ridge; and at the battle of Nashville commanded a division of cavalry, and was brevetted brig.gen. in 1865. He was brevetted maj.gen. U. S. A. for gallant services, and was retired with full rank in 1867.

JOHNSON, SAMUEL, son of Michael Johnson, was b. at Lichfield, on Sept. 18, 1709. He received his early education in his native town, from a man named Hunter; of whom he has recorded that "he beat me very well"—adding, "without that I should have done nothing." In 1728 he went to Pembroke college, Oxford, having been engaged for the two previous years of his life in learning his father's business of bookseller. The *Short Account of Lichfield*, 1819, says that books of his binding are still extant in that city. At Oxford Johnson spent probably the most unhappy period of his unhappy life. Overpowered by debts, difficulties, and religious doubts, he became a prey to the morbid melancholy of his constitution. Poverty prevented him from taking his degree. In 1731 his father died insolvent. In the same year he went to Bosworth as usher of a school. Finding the drudgery of this situation unbearable, he soon gave it up, gaining a meager livelihood by working for booksellers in Birmingham. In 1736 he married Mrs. Porter, a widow; she brought him £800. He then set agoing a school, which having no success, he repaired (1737) to London in the company of his celebrated pupil, David Garrick. Here he formed a connection with Cave, the editor of the *Gentleman's Magazine*, to which periodical he became a contributor. In the following year he published *London*, a poem in imitation of the third satire of Juvenal, which was very favorably received, Pope, in particular, being warm in its praise. But for many years he was miserably remunerated for his work, and had great difficulty in keeping the wolf of hunger from his door. Little is known respecting Johnson's life from this period till he was turned of fifty. We may form, however, some guess of the measure of its unhappiness, when we consider the character and constitution of the man,

and what was the position of the majority of men of letters at that time—for literature, “a dark night between two sunny days”—when the day of patrician patronage was at its close, and that of public patronage had not yet dawned. After 1740 he began to “report” (if we may be allowed to misuse this word) the parliamentary debates for Cave’s magazine. These “debates” were drawn up by Johnson himself, after he had ascertained the order in which the different speakers rose, and the drift of their arguments. One can readily believe that statesmen were surprised at the splendor and pomp of their own eloquence when they saw it in print. In 1744 Johnson published his interesting *Life of Richard Savage*; in 1749 his best poem, *The Vanity of Human Wishes*, an imitation of the tenth satire of Juvenal; and in 1750 commenced *The Rambler*, a periodical which he conducted for two years, and the contents of which were almost wholly his own composition. His *Dictionary*, a noble piece of work, entitling its author to being considered the founder of English lexicography, appeared in 1755, after eight years of solid labor; *The Idler*, another periodical, was begun by Johnson in 1758, and carried on for two years also; and in 1759 occurred one of the most touching episodes of his life—the writing of *Rasselas* to pay the expenses of his mother’s funeral. It was written, he tells us, “in the evenings of a week.” At last he emerged from obscurity. In 1762 a pension of £300 a year was conferred on him by lord Bute; and in the following year occurred an event, apparently of little moment, but which has had a lasting influence upon his fame; this was his introduction to James Boswell, whose *Life of Dr. Johnson* is probably more imperishable than any of the doctor’s own writings. In 1764 the famous literary club was instituted, and the following year began his intimacy with the Thrales. In the same year appeared his edition of Shakespeare. In 1773 he visited the Highlands with Boswell. In 1781 appeared his *Lives of the Poets*, his last literary work of any importance. He died on Dec. 13, 1784. He was buried in Westminster abbey, close by the grave of Garrick.

Strength, or at least force of mind, a certain sage solemnity in the treatment of moral themes, a sharp eye for the observation of character as it manifests itself in society, and a great power of caustic wit, are the chief qualities noticeable in Johnson. He had little aptitude for abstract thinking, and no great vigor of imagination—hence he was neither a philosopher nor a poet; but he had good sense, a solid judgment, and a serious thoughtful nature—hence we find scattered through his numerous works a multitude of valuable remarks on books and men and manners. His written style is very sonorous, inflated, and antithetic; the language is frequently grander than the thought, but his conversational style, as reported by Boswell, is terse, robust, and felicitous in the highest degree.

JOHNSON, SAMUEL, b. Mass., 1822; a graduate of Harvard university and of the divinity school, and pastor of a “free church” in Lynn, Mass., being independent in his religious opinions, though agreeing generally with the Unitarian belief. He edited, jointly with the rev. Samuel Longfellow, a collection of sacred poetry entitled *Hymns of the Spirit*.

JOHNSON, SAMUEL, D.D., 1696–1772; b. Conn.; a graduate of Yale college, and the first president (1754–63) of King’s, now Columbia, college, New York. He received the degree of A.M. both at Oxford and Cambridge; but, notwithstanding his ability and his learning, he was unpopular with the New England people. He was constantly involved in controversy, growing out of his adoption of the Episcopalian faith, and published many controversial works. His other writings were *A System of Morality*, a compend of logic and metaphysics, and another of ethics, the two latter being introduced into the university of Pennsylvania as text-books. He also published an *English and Hebrew Grammar*.

JOHNSON, WALTER ROGERS, 1794–1852; b. Mass.; a scientific expert in the departments of physics and applied chemistry. He was a teacher in Pennsylvania 1821–26, when he became professor of mechanics and natural philosophy in the Philadelphia high school. He devoted himself to studying the strength of materials and mechanical construction, and was often employed in consultation and as an expert in the construction of public works. In 1848 he was attached to the Smithsonian institution, was connected with the first world’s fair, London, 1851, and was the first secretary of the American association for the advancement of science. He wrote *Coal Trade of British America*; *Report on Coals*; and *Use of Anthracite in the Manufacture of Iron*.

JOHNSON, Sir WILLIAM, 1715–74; b. Ireland; was sent to America in 1738 to take the management of the estates of his uncle, admiral sir Peter Warren. His business brought him in contact with the Mohawk Indians, whose language he learned, and who made him an honorary chieftain of their tribe. Johnson received his baronetcy during the French and Indian war, for having defeated baron Dieskau at lake George (which he named). He fought with Abercrombie at fort Ticonderoga, and on the death of gen. Prideaux before fort Niagara, he succeeded that general in the command of the expedition, in which he was completely successful. Sir William’s services to the British cause were highly esteemed, and the king presented him with a grant of 100,000 acres of land in New York, where sir William settled in the new residence which he erected, and which was called “Johnson Hall.” Around this center a settlement was made which soon grew into the village of Johnstown, Tryon co., N. Y. Sir William continued to reside

on his estate until his death, and aided largely in the development of the surrounding country, and in fostering stock-raising and agriculture. In 1768 he effected the important treaty with the Indians at fort Stanwix.

JOHNSON, WILLIAM SAMUEL, LL.D., 1727-1819; b. Conn.; educated for the bar after graduating at Yale in 1744. He was in England in 1766 acting as a colonial agent, and while there became acquainted with Dr. Samuel Johnson, with whom he corresponded after his return to America. A member of congress in 1783, he was also a member of the constitutional convention of 1787, and two years later sat in the U. S. senate to represent his native state. From 1791 to 1800 he was president of Columbia college, New York.

JOHNSTON, a co. in e. North Carolina, traversed by the Little and Neuse rivers, and th. Richmond and Danville, and Atlantic and North Carolina railroads; 640 sq.m.; pop. '70, 16,897; surface undulating and heavily wooded, two-thirds of the entire acreage in 1870 being woodland. The soil is fairly productive, corn, sweet potatoes, and cotton being chiefly grown. Pork is extensively raised. Minerals are generally diffused, including iron, lead, gold, silver, and zinc. Granite is also abundant. Capital, Smithfield.

JOHNSTON, ALBERT SIDNEY, 1803-62; educated at West Point, graduated 1826, and entered the U. S. army in the Sixth infantry. He fought in the Black Hawk war, but resigned from the service shortly after its close, and emigrated to Texas, then struggling for its independence, which was declared in 1836. Johnston enlisted in the Texan army after the battle of San Jacinto, and was appointed commander-in-chief in place of gen. Felix Houston, with whom he fought a duel in consequence. In 1838 gen. Johnston received the appointment of secretary of war, but two years later retired from the public service, and became a planter. When the war broke out between the United States and Mexico gen. Johnston raised a Texan rifle-regiment, of which he took command, and at the siege of Monterey was acting inspector-general on the staff of gen. W. O. Butler. He was appointed by president Taylor a paymaster in the army in 1849, and in 1855 col. of the 2d U. S. cavalry. In 1857, the Mormons having defied the U. S. authority, a military expedition was sent against them, more with the design to overawe than to assume the offensive by positive action. This mission required great coolness and judgment, and gen. Johnston was chosen for its command. He led the expedition across the plains to Salt Lake city, and succeeded in effecting the purpose of the government without bloodshed. His success in this difficult enterprise was rewarded by a brevet brigadier-generalship. At the outbreak of the rebellion gen. Johnston was in command of the military division of the Pacific, but in May, 1861, resigned his commission, and, proceeding to Richmond, entered the service of the confederate government, being appointed a gen. and placed in command in the west. In the autumn of 1861 he held Bowling Green, Ky.; the capture of fort Donelson in the following spring forced him to evacuate this stronghold, and he retired with his army into Tennessee, and made a stand at Corinth, Miss., where he joined gen. Beauregard. With an army of 50,000 men he attacked gen. Grant, April 6, 1862, at Pittsburg Landing, and fought the battle of Shiloh. Gen. Johnston was killed by a rifle-ball on the first day of this engagement. He was esteemed by the confederates as among their bravest and most skillful generals. Gen. Grant has highly commended his ability; and Horace Greeley said of him (*American Conflict*) that he "was probably the ablest commander at any time engaged in the rebel service."

JOHNSTON, ALEXANDER KEITH, LL.D., F.R.S., the most distinguished name in British cartography, was b. near Edinburgh, Dec. 28, 1804. The elegance of design that characterizes all his productions, and which, in spite of their purely utilitarian aim, gives them a right to rank as specimens of fine art, was probably acquired or developed during his apprenticeship as an engraver. His first important work, the *National Atlas* (fol.), was published in 1843. Its merits received immediate recognition, and Johnston was appointed royal geographer for Scotland. Five years later appeared his far-famed *Physical Atlas of Natural Phenomena*, the publication of which was the signal for a shower of honors from the geographical societies of Europe—that of Paris, in particular, pronouncing the work "one of the most magnificent monuments that has yet been raised to the scientific genius of our age." A second edition, greatly improved, was issued in 1856. In 1850 appeared a very useful *Dictionary of Geography*, better known as "Johnston's Gazetteer" (5th ed. 1877). His *Royal Atlas of Geography* (1861) is probably the most beautiful and minutely accurate atlas ever executed. Johnston also published, in conjunction with other savants, atlases of astronomy and geology; besides a great number of very valuable educational atlases, physical, general, and classical, which have obtained a wide circulation. In 1865 Edinburgh university conferred on him the degree of LL.D., and in 1871 he received the patron's or Victoria gold medal of the royal geographical society. He died July 10, 1871.

JOHNSTON, ARTHUR, 1587-1641; b. in Aberdeenshire, Scotland; educated for a physician, and took his degree of M.D. in Padua in 1610. He was an enthusiastic student of the Latin and Greek classical writers, and formed from them a style which has been greatly admired by critical authorities. He wrote poems in Latin, and paraphrased, in the same language, the Psalms of David. He was physician-in-ordinary to Charles I. from 1632.

JOHNSTON, GABRIEL, b. Scotland at the close of the 17th c.; educated at the university of St. Andrews, in which he became professor of oriental languages; governor of North Carolina, 1734-52. In honor of the earl of Wilmington, whose patronage he enjoyed, he named one of the important towns of the state.

JOHNSTON, GEORGE, 1798-1855; b. Simprin, Scotland; studied medicine with Dr. Abercrombie; graduated at the university of Edinburgh in 1819, and practiced his profession at Berwick-on-Tweed. He devoted himself with great zeal and success to natural history. Besides numerous contributions to the *Edinburgh Philosophical Journal* and other scientific periodicals, he published *History of British Zoophytes*; *History of British Sponges and Lythophytes*; *Introduction to Conchology*; *The Natural History of the Eastern Borders*; and, at the time of his death, was preparing a work on British annelids.

JOHNSTON, JOHN, LL.D., b. Me., 1806; graduated at Bowdoin; was principal of a seminary at Cazenovia, N. Y.; in 1835 became assistant professor of natural science, and afterwards professor, at the Wesleyan university, Middletown, Conn., where he remains. He is the author of several books on chemistry and natural philosophy, which are used in many colleges and schools. He published also a history of Bristol and Bremen, Me., the latter containing valuable information in relation to the early history of the state. He has contributed to many important periodicals, and is a member of several historical societies and scientific associations.

JOHNSTON, JOHN TAYLOR, b. N. Y., 1820; educated in New York and Edinburgh; graduated at the university of New York in 1839; was admitted to the bar in 1843. He is president of the council of the university of the city of New York, and president of the metropolitan museum of art. He has been actively connected with railroads, and has been prominent as the efficient president of the Central railroad of New Jersey, to which office he was elected in 1848.

JOHNSTON, JOSEPH ECCLESTON, an American gen., b. Prince Edward co. Va., 1807; graduated at the military academy, West Point, in 1829; was engaged in garrison duty and as aide to gen. Scott in the Seminole war until 1837, when he resigned his commission and became a civil engineer, but re-entered the army in July, 1838, as first lieut. of topographical engineers; and brevetted capt. for gallantry in the Florida war. After this, until the commencement of the Mexican war, he was engaged in river and harbor improvements, and occupied with various surveys of the boundaries between the United States and the British possessions. In the Mexican war, 1846-47, he served with distinction, was twice wounded, and was brevetted maj., lieut.col., and col. In 1853-55 he had charge of western river improvements, and afterwards was engaged in various duties in Utah, Kansas, and elsewhere. In June, 1860, he was appointed quarter-master-gen., with the rank of brig.gen. April 22, 1861, he resigned his commission, and was appointed maj.gen or gen. in the rebel service by Jefferson Davis. In May he commanded a force at Harper's Ferry, where he was opposed by gen. Patterson. Moving on to Manasses he formed a junction with Beauregard. In the early part of the campaign of 1862 he had command of all the confederate forces in Virginia, and at the battle of Fair Oaks, near Richmond, May 31, 1862, was severely wounded, and for several months disabled for service. On reporting for duty in Nov. he was assigned, notwithstanding the hostility of Jefferson Davis, to the military department of Tennessee. In April, 1863, he reported himself still unfit for active service. In the spring following he made an attempt to relieve Vicksburg, which was besieged by Grant, but was defeated at Jackson, May 14, and retreated to Canton. After the defeat of Bragg by gen. Grant at Chattanooga, Nov. 25, 1863, Johnston was put in command of all the forces of the s.w. With 55,000 men he first occupied the fortified position of Dalton, Ga. Gen. Sherman attacked him with a superior force, and he was obliged to fall back first to Resaca, thence, after a severe battle, to Altoona pass, to Kenesaw mountain, and across the Chattahoochee. Gen. Sherman threatening his line of communication with Atlanta, his base of supply, and a place of great military importance, Johnston reached Atlanta in July, and determined to hold it to the last. But the authorities at Richmond were dissatisfied, and, July 17, ordered him to turn over his command to gen. Hood. Near the close of Feb., 1865, after Sherman had captured Atlanta, and marched without opposition to Savannah and into South Carolina, Johnston, at the earnest request of gen. Lee, was assigned to the command of the remnant of the army of the Tennessee, and of all the troops in South Carolina, Georgia, and Florida, and "to concentrate all available forces and drive back Sherman." But his force being inferior to that of Sherman he was defeated at Bentonville, N. C. Having learned that Lee had surrendered the army of Virginia to Grant, he capitulated to Sherman at Durham's station, N. C. Since the close of the war he has resided at Savannah, actively engaged in agricultural, commercial, and railroad enterprises. He has been considered one of the ablest generals, and by some the ablest in the confederate service. In 1878 he was proposed as a candidate for the U. S. senate from Georgia. He has published a *Narrative of His Military Operations* during the war.

JOHNSTON, SAMUEL, LL.D., 1733-1816; b. Dundee, Scotland; brought to North Carolina in infancy; was admitted to the bar; was a member of four provincial con-

gresses, presiding over the first two; a member of the continental congress, 1781-82; governor of North Carolina, 1788-89; U. S. senator, 1789-93; judge of the supreme court, 1800-3.

JOHNSTONE, a manufacturing t. of Scotland in the co. of Renfrew, was founded in 1781, and is situated on the Black Cart, about 3 m. w. of Paisley. It contains several cotton factories, a flax-mill, brass and iron foundries, and machine-shops. Pop. '71, 6,882.

JOHNSTONE, JAMES T. W., an eminent chemist, was b. at Paisley in 1796, and died at Durham in 1853. He was of humble parentage, and was for the most part self-educated. In 1825 he removed to Durham, where he opened a school, which he continued till 1830, when, having married a lady of considerable fortune, he resolved to carry out the plan which he had long desired, of devoting himself to the study of chemistry. He accordingly repaired to Stockholm, and became the pupil of Berzelius, the most celebrated chemist of the time; and his reputation rose so rapidly, that in 1833, while still pursuing his studies abroad, he was invited to take the readership in chemistry and mineralogy in the newly-established university of Durham. For some time after his return from the continent he resided in Edinburgh, and held the post of chemist to the agricultural society; but shortly after its dissolution, he took up his permanent residence at Durham. It is as an agricultural chemist that he is chiefly known. His *Catechism of Agricultural Chemistry and Geology* has gone through more than fifty editions, and has been translated into almost every European language; and his *Lectures on Agricultural Chemistry and Geology* are held in high esteem. The last of his works was his *Chemistry of Common Life*, which originally appeared in *Blackwood's Magazine*, and has since gone through two editions. In the summer of 1853, while traveling on the continent, apparently in his usual health, he was seized with spitting of blood, which terminated in a rapid decline.

JOHNSTONE, ROBERT, b. in the latter half of the 16th c., was a historian whose works were at one period highly valued. Of his personal history little is known, except that he went to London; accumulated a large fortune, bequeathed considerable sums to the university of Edinburgh, and to various towns in Annandale, the home of his ancestors, and died in 1639. His *Historia Rerum Britannicarum, etc., ab anno 1572 ad annum 1628*, intended as a supplement to Buchanan's work, possessed real merit.

JOHNSTOWN, a t. in New York on Cayadutta creek, a branch of the Mohawk river; 48 m. n.w. of Albany; pop. '70, 3,282; connected with Fonda, on the New York Central railroad, by the Fonda, Johnstown and Gloversville railroad. It has 9 churches, 2 banks, a union school, 3 weekly newspapers, 3 hotels, gas-works, planing and grist mills, factories for gloves and mittens, and establishments for the dressing of skins and leather. The population of the town, which includes Gloversville and some other villages is 16,626.

JOHNSTOWN, a borough of Cambria co., Penn., at the junction of Conemaugh river and Stony creek, on the Pennsylvania canal and railroad; 78 m. e. of Pittsburg, 39 m. s.w. of Altoona. The extensive works of the Cambria iron co., employing 1600 men in making iron and steel rails for railroads, are in this borough. It has also 16 churches, a convent, an academy, a national and savings bank, a daily and 4 weekly newspapers, tanneries, flour, woolen, and planing mills.

JOIGNY (anc. *Joviniacum*), an old walled t. of France, in the department of Yonne, about 90 m. s.e. of Paris, noted for its red wines and extensive trade in wool. Pop. '76, 5,975.

JOINDER OF PARTIES, in law, is a phrase signifying that persons having a common interest and a common responsibility in any matter or subject are to be joined in any action at law relating thereto. Such joinder arises generally out of joint contract, ownership, or wrong done. When two or more persons are joined in a contract, they must be joined also in any action arising therefrom. If one of two joint parties die, the rule gives way, and the survivor either sues or is sued as the case may be. When the parties are so numerous that they cannot all be brought into court, one of them may sue for the benefit of the whole; as where an administrator is called to render an account to many creditors of moneys in his hands, one creditor may bring an action not only for himself, but also for all the others. In cases of tort the parties responsible are not necessarily all joined as defendants, but where two or more persons are jointly injured they should be joined as plaintiffs, but not where the injury is to the person. The practice in respect to husband and wife is modified by the rule of the common law which merges the legal existence of the latter in that of the former. But by the common law they must be joined for torts committed by the wife before or during marriage, and must join as plaintiffs for personal injuries to the wife, or injuries to her property before marriage. And they must join and be joined in actions or contracts made by the wife before marriage, in actions arising from the wife's position as executrix and administratrix, and in many other cases. In New York and several other states, however, this rule has been set aside in many cases by recent legislation, which recognizes the personality of the wife in the same way as if she were unmarried.

In courts of law a failure to make the proper persons parties is fatal to the action; but courts of equity are not so strict.

JOINERY, the art of joining or framing together the wooden finishings of buildings, such as the doors, windows, shutters, stairs, etc. See CARPENTRY.

JOINT AND SEVERAL, a legal phrase in England and Ireland, meaning that a contract or obligation is made by, or in favor of, each of several parties, independently as well as jointly with the others. The general rule of law is, that a contract of several persons is joint, and not several—that is to say, if it is sought to be enforced against them, they must all be sued together, and an action cannot be brought against one. Thus, for example, if A, B, and C jointly accept a bill, or make a promissory-note, without saying, “we jointly and severally promise, etc.,” the whole of them must be sued on such bill. If, however, any one pay the whole debt, he can sue his co-contractors for their respective contribution or proportion—namely, one-third from each. If, on the other hand, the parties had, by express words, jointly and severally made the promissory-note, or bound themselves, then the creditor could sue any one of them he pleases, without taking any notice of the rest. Whichever of them, however, first paid the debt, would be equally entitled to sue his co-debtors to contribute their fair proportions. So, if a contract is made in favor of two or more persons, the general rule is, that all of them must join in any action brought to enforce the contract. But in some cases, when a contract is capable of being separated into distinct interests, it is not necessary that all of the creditors should sue. Much depends on the nature of the contract, the situation and relations of the parties, and who paid the price or consideration. In Scotland the phrase conjunctly and severally is more frequently used than jointly and severally, though the meaning is the same. There are, however, some differences between the laws of England and Scotland on the subject. In Scotland the general rule is the reverse of what it is in England. When a contract is joint, each is concerned and liable only for his share; but when it is expressly stated to be a conjunct contract, each is liable for the whole. Moreover, where one of several debtors is discharged without an express reservation of the remedy against the rest, this operates in England as a discharge to the whole; whereas in Scotland it operates only as a discharge of that one.

JOINT AND SEVERAL (*ante*), a legal phrase defining the liability of two or more persons for a debt which they owe in common. It implies that each individual debtor is responsible not merely for a relative proportion of the indebtedness, but for the whole, and may be sued therefor if the creditor so elect. It might happen that all the debtors save one have become insolvent, in which case the one who is solvent may be compelled to pay the whole debt. In that case he will have a claim in law upon his co-debtors for their respective portions of the common indebtedness, and no more; their responsibility to each other being determined by a different rule from that which applies to their common relation to the creditor. In equity, however, those who are solvent are required to contribute equally toward the discharge of the entire debt. A joint and several obligation may either be created by the express language of a contract or covenant, or arise by necessary or fair implication of terms. It is usual to employ the words, “we jointly and severally,” but any other language fairly implying the same thing is equally binding. A joint and several obligation may also arise from the legal relations of the parties. If the creditor grant a release under seal to one of several joint debtors, he will thereby release them all. If a judgment against one be returned unsatisfied, it will not bar an action against the others. A joint and several liability may also arise in cases of tort; and when this happens the injured party may sue one, any, or all, of the responsible parties. Full damages may be recovered from the person prosecuted, and he will have no claim upon the other wrong-doers unless he can show that he was not himself willfully or intentionally a participant in the wrong complained of.

JOINT-FIR. See SEA-GRAPE.

JOINT OWNER is, in English law, a person who is one of several owners of property. The property may be either personal or real, goods or land. One of the characteristics of this ownership is, that if one of the parties dies, his interest accrues to the others, and does not go to the deceased co-owner's heirs or representatives. Thus, if A and B are joint owners of a horse, and A dies, the horse then belongs entirely to B. So it is with real property, such as houses, lands, and estates. This is called the doctrine of survivorship. Sometimes in wills and deeds it is not clearly expressed whether the property was given to A and B as joint tenants or owners, or as tenants in common. The chief difference between these two descriptions of owners is, that if one tenant in common dies, his share does not go to the other tenants in common, but belongs to his representatives or heirs. Hence, in doubtful cases, a court of equity generally inclines to hold that a tenancy in common was meant rather than a joint tenancy, for the former is the more fair of the two kinds of ownership. In all cases, however, it is in the power of a joint owner to convert his joint tenancy into a tenancy in common, by simply executing a deed of partition or alienation, if the property consist of land; or selling his share, if it consist of personality. And there is an exception as to the survivorship in the case of a firm of partners, for in that case, when one partner dies, his share does not

accrue to his co-partners, but belongs to his own personal representatives. This is said to be an exception to the general rule of joint ownership, created for the benefit of trade, so that, in the case of a firm, the ownership is an ownership in common, and not joint ownership. In Scotland the general rule is different from what prevails in England, and joint property is there always equivalent to what is called in England property held in common, and not joint in the above sense. It requires express words in Scotland to make the property be held so as to be equivalent to what is joint property in England.

JOINTS, in anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body through the intervention of a structure or structures of a different nature. The textures which enter into the formation of the more complex joints are bone, cartilage, fibro-cartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the bony segments; while the three remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation with each other.

Joints have been divided by anatomists into two great classes, to which the terms *synarthrosis* and *diarthrosis* are applied. In synarthrosis the parts are continuous—that is to say, there is no synovial sac intervening between the bones; and the joints belonging to this class are so very limited in their motion as to be considered by some as immovable; while in diarthrosis the articular surface of each of the bones is covered with cartilage, and between these cartilaginous plates is a synovial sac; and mobility is the distinguishing feature of this class of joints. In briefly describing the leading varieties of these two classes of joints we shall, as far as possible, avoid the barbarous terms which have been introduced into this department of anatomy.

In synarthrosis the articulation is said to be by *suture* when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of beveling of one bone, so that it is overlapped by the other. Both these kinds of suture are at once seen in the human skull, the serrated suture being well seen in the union of the two parietal bones, the beveled suture being shown in the overlapping of the temporal bone above the side of the parietal, and a combination of the two being exhibited by the coronal suture between the frontal bone and the anterior edges of the parietal bones. In all these there is a thin ligamentous membrane interposed between the bones, which disappears as the growth of the cranium becomes completed.

When a slight amount of motion of one bone upon another is required to be combined with great strength, the contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, with which a little elastic tissue is intermixed. This is an intermediate variety between the two classes of joints, but approximates most nearly to synarthrosis. As examples of this kind of joint may be mentioned the articulation between the bodies of the vertebræ and that between the two pubic bones at what is termed the symphysis. See PELVIS.

In diarthrosis the degree and nature of the motion are very various. There may be merely a little *gliding* motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. See HAND and FOOT. In these cases the surfaces are plane, or one is slightly concave and the other slightly convex; and the motion is limited in extent and direction by the ligaments of the joint, or by some projecting point of one of the bones. In some cases instead of a slight concavity and convexity, one bone presents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of *ball and socket* that is applied to such joints. The best example of this variety is the hip-joint (q.v.), and the next best is the shoulder. In these joints the ball is kept in apposition with the socket by means of what is termed a *capsular* ligament, which may be described as a barrel-shaped expansion of ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. This species of joint is capable of motion of all kinds, as any one may readily test for himself, especially in the shoulder-joint.

Another important variety of articulation is the hinge-joint, in which the contiguous surfaces are marked with elevations and depressions, which exactly fit into each other, so as to restrict motion to one direction. The elbow and ankle joints, and the joints of the fingers and toes, are the best examples of this variety. The knee-joint is a less perfect example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments. The shells of bivalve mollusks are united by a very strong and perfect hinge-joint.
